FINITE ELEMENT METHOD OF ANALYZING STEADY SEEPAGE WITH A
FREE SURFACE,
W70-09198 02G

A MOVING BOUNDARY MODEL OF A ONE-DIMENSIONAL SATURATED-
UNSATURATED, TRANSIENT POROUS FLOW SYSTEM,
W70-09199 02G

FINGER IMBIBITION IN ARTIFICIAL REPLENISHMENT OF GROUNDWATER
THROUGH CRACKED POROUS MEDIUM,
W70-09200 02F

GROUNDWATER DISCHARGE IN THE ILLINOIS BASIN AS SUGGESTED BY
TEMPERATURE ANOMALIES,
W70-09201 02F

ELECTROLYTIC MODEL STUDY FOR COLLECTOR WELLS UNDER RIVER
BEDS,
W70-09210 02F

AQUIFER SIMULATION ON SLOW TIME RESISTANCE-CAPACITANCE
NETWORKS,
W70-09226 02F

GROUNDWATER VELOCITY PARTITION,
W70-09227 02F

THE THREE-PHASE DOMAIN IN HYDROLOGY,
W70-09260 02F

VALIDITY CONDITIONS OF THE POINT DILUTION METHOD,
W70-09284 02F

DETERMINATION OF THE VELOCITY AND DIRECTION OF GROUNDWATER
FLOW BY RADIOISOTOPES,
W70-09366 02F

GROUNDWATER POLLUTION
A STUDY OF FARM WASTE, FARM ANIMAL WASTE CHARACTERIZATION,
HANDLING, UTILIZATION,
W70-09426 05B

GULLIES
MORPHOLOGY OF GULLIES IN THE COLORADO ROCKY MOUNTAINS,
W70-09372 04D

GULLY EROSION
MORPHOLOGY OF GULLIES IN THE COLORADO ROCKY MOUNTAINS,
W70-09372 04D

GUMBEL PAPER
FLOOD SERIES FOR GAGED PENNSYLVANIA STREAMS,
W70-09420 02E

HALOPHYTES
EFFECT OF VARIATIONS IN SUBSTRATE SALINITY ON THE WATER
BALANCE AND IONIC COMPOSITION OF SPAN LEAVES,
W70-09144 02I

MINERAL METABOLISM OF HALOPHYTES,
W70-09147 02I

HARBORS
USE OF TRACERS IN HARBOR, COASTAL AND OCEAN ENGINEERING,
W70-09029 07B

ERIE LACKAWANNA BY V SILLS (SUNKEN VESSEL OBSTRUCTING DOCKS
AS TRESPASS).
W70-09500 06E

HEART RATE
PHYSIOLOGICAL RESPONSES TO TEMPERATURE AND DESICCATION IN
THE ENDEMIC NEW MEXICO PLETHODONTIDS, PLETHODON NEOMEXICANUS
AND ANEIDES HARDII,
W70-09145 02I

HEAT BUDGET
THERMAL ENERGY CONSERVATION AND SEQUENTIAL BIOLOGICAL
PROCESSING APPLIED TO SEWAGE LAGOON DESIGN,
W70-09338 05D

HEAT EXCHANGE COEFFICIENT
A STUDY OF HEAT TRANSFER COEFFICIENTS IN THE LOWEST 400
METERS OF THE ATMOSPHERE,
W70-09156 02B

HEAT EXCHANGERS
INTERNAL CATHODIC PROTECTION OF WATER COOLED PLANT,
W70-09014 08C

HEAT FLOW
A STUDY OF HEAT TRANSFER COEFFICIENTS IN THE LOWEST 400 METERS OF THE ATMOSPHERE,
W70-09156 02B

NOTES ON A THEORY OF THE THERMOCLINE,
W70-09191 05B

HEAT RESISTANCE
EFFECT OF TEMPERATURE AND SALINITY ON THE HEAT TOLERANCE IN THE HERMIT CRAB, DIOGENES BICRISTIMANUS,
W70-09166 05C

EFFECT OF TEMPERATURE SHOCK ON THE TEMPERATURE RESISTANCE OF POIKILOTHERM AQUATIC ANIMALS. EXPERIMENTS ON THE PROBLEM OF HEAT AND COLD-HARDENING IN ANIMALS (GERMAN),
W70-09456 05C

HEAT TRANSFER
A STUDY OF HEAT TRANSFER COEFFICIENTS IN THE LOWEST 400 METERS OF THE ATMOSPHERE,
W70-09156 02B

HEATED WATER
HEAT WASTE,
W70-09162 05B

HEATING
SPACE HEATING IN URBAN ENVIRONMENTS,
W70-09192 08C

USES OF WASTE HEAT,
W70-09193 03C

HEAVY METALS
LEAD IN A SUBURBAN ENVIRONMENT,
W70-09251 02K

RELATION BETWEEN THE 'ITAI-ITAI' DISEASE AND THE POLLUTION OF RIVER WATER BY CADMIUM FROM A MINE,
W70-09427 05C

HERBICIDES
TOXICITY OF SELECTED HERBICIDES TO BLUEGILL SUNFISH
W70-09435 05C

HIGH VOLTAGE
PREDICTION OF RELIABILITY AND AVAILABILITY OF HVDC VALVE AND EVIC TERMINAL,
W70-09017 08C

HIGH WATER MARK
CITY OF NEW YORK V WILSON AND CO (EJECTMENT ACTION BY CITY SEEKING POSSESSION OF FILLED LANDS ORIGINALLY BELOW THE HIGH WATER MARK OF RIVER).
W70-09142 06E

HISTORIC FLOOD
FLOOD OF AUGUST 1969 IN VIRGINIA,
W70-09234 02E

HORIZONTAL ASYMPTOTE
FLOOD SERIES FOR GAGED PENNSYLVANIA STREAMS,
W70-09420 02E

HORIZONTAL TEMPERATURE GRADIENT
THE TEMPERATURE SELECTION OF SMALL HYPOPHYSECTOMIZED GOLDFISH, (CARASSIUS AURATUS L.),
W70-09151 05C

HUMIDITY
A CONTRIBUTION TOWARDS THE REDUCTION OF ICE FOG CAUSED BY HUMID STACK GASES AT ALASKAN POWER STATIONS,
W70-09172 05G

HURRICANES
FLOOD OF AUGUST 1969 IN VIRGINIA,
W70-09234 02E

HYDRAULIC CONDUCTIVITY
EFFECTS OF SALTS AND ORGANIC MATERIALS ON THE HYDRAULIC CONDUCTIVITY OF THE SOILS,
W70-09290 02G

INFILTRATION RATE AS RELATED TO HYDRAULIC CONDUCTIVITY, MOISTURE DEFICIT AND OTHER SOIL PROPERTIES,
W70-09300 02G

AN APPROXIMATE METHOD FOR DETERMINING THE HYDRAULIC CONDUCTIVITY FUNCTION OF UNSATURATED SOIL,
W70-09342 02G

THE EFFECT OF TEMPERATURE ON WATER FLOW IN SOILS,
W70-09345 02G

HYDRAULIC DESIGN
HYDRAULIC DESIGN FOR CHECK METHOD OF IRRIGATION,
W70-09136 03F

AN EVALUATION OF THE PROBLEMS OF SANITARY SEWER SYSTEM DESIGN,
W70-09185 08A

HYDRAULIC MODELS
FLUME STUDIES OF THE SEDIMENT TRANSFER COEFFICIENT,
W70-09119 02J

OPERATING FORCES ON SECTOR GATES UNDER REVERSE HEADS HYDRAULIC MODEL INVESTIGATION,
W70-09177 08B

WAVE ACTION AND BREAKWATER LOCATION, VERMILION HARBOR, OHIO HYDRAULIC MODEL INVESTIGATION,
W70-09178 08B

ESTUARY ENTRANCE, UMPQUA RIVER, OREGON HYDRAULIC MODEL INVESTIGATION,
W70-09179 02L

SPILLWAY AND OUTLET WORKS, POWELSBURG DAM, CHEAT RIVER, WEST VIRGINIA HYDRAULIC MODEL INVESTIGATION,
W70-09180 08B

EFFECTS OF EFFLUENT AND INFLUENT SEEPAGE ON THE HYDRODYNAMIC FORCES ACTING ON AN IDEALIZED NONCOHESIVE SEDIMENT PARTICLE,
W70-09410 08B

HYDRAULIC STRUCTURES
A CRITICAL STUDY OF THE THEORIES CONCERNING UPLIFT IN HYDRAULIC STRUCTURES ON PERVIOUS FOUNDATIONS,
W70-09044 08D

HYDRAULICS
THE DETERMINATION OF THE TRANSPORT COEFFICIENTS OF CELLULOSE ACETATE MEMBRANES,
W70-09357 03A

ENERGY AND HYDRAULIC TESTS ON MECHANICAL AERATION SYSTEMS,
W70-09503 05D

HYDROCARBONS
THE EFFECT OF SALINITY ON THE OXIDATION OF HYDROCARBONS IN ESTUARINE ENVIRONMENTS,
W70-09424 05B

HYDROELECTRIC PLANTS
UNITED STATES V WILLOW RIVER POWER CO (IMPAIRED EFFICIENCY OF HYDROELECTRIC PLANT CAUSED BY RAISING THE WATER LEVEL OF THE RIVER ON WHICH IT WAS LOCATED).
W70-09073 06E

HYDROELECTRIC POWER
NIAGARA FALLS POWER CO V DURYEA (RIGHT OF STATE TO CHARGE FOR WATER USE).
W70-09063 06E

HYDROGEN BONDING
A BONDING MODEL FOR ANOMALOUS WATER,
W70-09126 01A

HYDROGEN ION CONCENTRATION
RESPONSE OF DAIRY WASTE ACTIVATED SLUDGE TO EXPERIMENTAL CONDITIONS AFFECTING PH AND DISSOLVED OXYGEN CONCENTRATION,
W70-09332 05D

HYDROGEOLOGY
SUMMARY OF GROUNDWATER OCCURRENCE IN CALIFORNIA,
W70-09214 02F

HYDROLOGICAL ANALYSIS OF VOLCANIC TERRANE LOWER BASIN OF THE RIO GRANDE DE SAN MIGUEL, EL SALVADOR,
W70-09370 03B

THE USE OF SEISMIC REFRACTION AND GRAVITY METHODS IN HYDROGEOLOGICAL INVESTIGATIONS,
W70-09399 07B

BOREHOLE GEOPHYSICS AS APPLIED TO GROUNDWATER,
W70-09400 07B

A REVIEW OF SOME PROBLEMS OF SEISMIC PROSPECTING FOR GROUNDWATER IN SURFICIAL DEPOSITS,
W70-09402 07B

HYDROGRAPHY
STUDY OF THE USE OF AERIAL AND SATELLITE PHOTOGRAMMETRY FOR SURVEYS IN HYDROLOGY,
W70-09454 07B

HYDROLOGIC ASPECTS
HYDROCHEMICAL CHARACTERISTICS OF SMALL RESERVOIRS IN SOME DISTRICTS OF THE CENTRAL CHERNOZEM PROVINCES,
W70-09419 02K

HYDROLOGIC BUDGET
METHOD FOR COMPUTING GROUNDWATER LEVEL FLUCTUATIONS,
W70-09103 02F

WATER BUDGET OF UPPER KLAMATH LAKE SOUTHWESTERN OREGON,
W70-09250 02H

HYDROLOGIC DATA
A PROPOSED STREAMFLOW DATA PROGRAM FOR MAINE,
W70-09353 07A

GROUNDWATER RECORDS OF SOUTH CAROLINA - 1966,
W70-09411 02F

HYDROCHEMICAL CHARACTERISTICS OF SMALL RESERVOIRS IN SOME DISTRICTS OF THE CENTRAL CHERNOZEM PROVINCES,
W70-09419 02K

HYDROLOGIC MODELS
RUNOFF SYNTHESIS FOR RAIN-ON-SNOW BASIN,
W70-09027 02E

HYDROLOGY
HYDROLOGICAL BIBLIOGRAPHY.
W70-09376 10

HYSTERESIS
HYSTERESIS IN TWO SANDS AND THE INDEPENDENT DOMAIN MODEL,

W70-09209 02G

ICE JAMS
MOHAWK CARPET MILLS, INC V NEW YORK (DAMAGES FROM FLOOD AND ICE JAM).
W70-09157 06E

ICE FOG
A CONTRIBUTION TOWARDS THE REDUCTION OF ICE FOG CAUSED BY HUMID STACK GASES AT ALASKAN POWER STATIONS,
W70-09172 05G

ICE JAMS
MOHAWK CARPET MILLS, INC V STATE (FLOODING CAUSED BY STATE'S NEGLIGENCE IN CANAL CONSTRUCTION).
W70-09458 04A

ICED LAKES
CHEMICAL COMPOSITION OF THE ICE OF OTKAZNENSKIY RESERVOIR,
W70-09097 02K

IDAHO
HYDROLOGY OF THE UPPER MALAD RIVER BASIN, SOUTHEASTERN IDAHO,
W70-09132 02E

IDAHO
BURLEY IRRIGATION DIST V ICKES (RIGHTS TO PROFIT FROM DAM OPERATION).

MAP OF EVAPORATION FROM SMALL RESERVOIRS OF THE CENTRAL CHERNOZEM PROVINCES,
W70-09413 02D

CHARACTERISTICS OF SILTING OF SMALL RESERVOIRS OF THE CENTRAL CHERNOZEM PROVINCES AND COMPUTATION OF DENSITY OF DEPOSITS,
W70-09417 02J

DEVELOPING A METHOD OF COMPUTING SILTING OF SMALL RESERVOIRS IN THE CENTRAL CHERNOZEM PROVINCES,
W70-09418 02J

AND DEVELOPMENT
SOIL, WATER AND SUBURBIA.
W70-09188 06B

AND MANAGEMENT
COASTAL WETLANDS OF VIRGINIA-INTERIM REPORT,
W70-09350 02L

AND RECLAMATION
EXPERIMENT IN THE LEACHING OF SALINE LAND IN SOUTHERN KAZAKHSTAN,
W70-09258 03C

LAND TENURE
VARNEY RIVER DRAINAGE DIST V SPIEDEL (ASSESSMENTS ON LAND HELD BY EQUITABLE TITLE).
W70-09058 06E

BURAS V ELLZEY (POSSESSORY RIGHTS IN WATERFRONT PROPERTY).
W70-09323 06E

LAND USE
SOIL, WATER AND SUBURBIA.
W70-09188 06B

LAND USE POLICIES
SOIL, WATER AND SUBURBIA.
W70-09188 06B

LANDFILLS
CITY OF NEW YORK V WILSON AND CO (EJECTMENT ACTION BY CITY SEEKING POSSESSION OF FILLED LANDS ORIGINALLY BELOW THE HIGH WATER MARK OF RIVER).
W70-09142 06E

LATERAL FORCES
LATERAL PRESSURES ON RIGID PERMANENT STRUCTURES,
W70-09045 08D

LATERALS
BROWN V NORTH ST LUCIE RIVER DRAINAGE DIST (DUTY OF LANDOWNERS TO MAINTAIN LATERALS CONNECTING TO DITCH OF DRAINAGE DISTRICT).
W70-09088 06E

LATOSOLS
EFFECTS OF SALTS AND ORGANIC MATERIALS ON THE HYDRAULIC CONDUCTIVITY OF THE SOILS,
W70-09290 02G

LEACHING
EXPERIMENT IN THE LEACHING OF SALINE LAND IN SOUTHERN KAZAKHSTAN,
W70-09258 03C

LEAD FALLOUT
LEAD IN A SUBURBAN ENVIRONMENT,
W70-09251 02K

LEAKAGE
LEAKAGE THROUGH BURIED CHANNELS,
W70-09049 04A

LEASES
CARTER OIL CO V DELWORTH (LESSEE OF LAND ABUTTING CREEK HAS RIGHT TO CREEK BED).
W70-09468 06E

LEATHER WASTE
CATTLE SKIN TANNERY WASTES TREATMENT IN A COMPLETELY MIXED ACTIVATED SLUDGE PILOT PLANT,
W70-09324 05D

LEGISLATION
YEARSLEY V W A ROSS CONST CO (LIABILITY OF PRIVATE CORPORATION ACTING PURSUANT TO AN ACT OF CONGRESS).
W70-09070 06E

COMM'RS OF DRAINAGE DISTRICT NO 5 V ARNOLD (JUDICIAL INTERPRETATION OF DRAINAGE STATUTE).
W70-09154 04A

LEVEES
UNITED STATES V SPONENBARGER (ALLEGED TAKING OF PRIVATE PROPERTY WITHOUT JUST COMPENSATION VIA FLOOD CONTROL PLAN).
W70-09068 06E

PALM BEACH COUNTY V SOUTH FLORIDA CONSERVANCY DIST (DRAINAGE DISTRICT'S USE OF LEVEE FOR CONSERVATION PARAMOUNT TO COUNTY'S USE AS A PUBLIC ROAD).
W70-09087 06E

LINEAR ALKYLATE SULFONATES
ANIONIC AND NONIONIC SURFACTANT SORPTION AND DEGRADATION BY ALGAE CULTURES,
W70-09438 05C

LOADINGS
EFFECT OF RECIRCULATION ON DEEP TRICKLING FILTER PERFORMANCE,
W70-09321 05D

DEGRADATION OF WASTE WATER ORGANICS IN SOIL,
W70-09329 05E

TREATMENT OF DAIRY MANURE BY LAGOONING,
W70-09335 05D

LOCAL GOVERNMENTS
ACKERMAN V TOWNSHIP OF NORTH HUNTINGDON (MUNICIPAL AUTHORITY TO GRANT RIGHTS IN PRIVATELY OWNED SEWER LINE).
W70-09053 06E

MAFFEI V BERRIEN COUNTY (COUNTY'S LIABILITY FOR FLOOD DAMAGE CAUSED BY NEGLIGENT MAINTENANCE OF DRAINAGE SYSTEM).
W70-09492 04A

LOUISIANA
DICKSON V SANDEFUR (DISPUTED OWNERSHIP OF LAND APPEARING AFTER SUDDEN SHIFT IN RIVER'S COURSE).

EVALUATION OF SOIL MOISTURE MEASUREMENTS IN OKLAHOMA AS SOIL CHARACTERISTICS FOR CLASSIFICATION,
W70-09377 02G

A GAMMA-PHOTONEUTRON METHOD FOR LABORATORY STUDIES OF SOIL WATER,
W70-09382 02G

NUCLEAR POWERPLANTS
HEAT WASTE,
W70-09162 05B

EFFECTS OF THERMAL DISCHARGE FROM THE SAN ONOFRE NUCLEAR GENERATING STATION,
W70-09165 05C

SPACE HEATING IN URBAN ENVIRONMENTS,
W70-09192 08C

NUCLEAR REACTORS
SPACE HEATING IN URBAN ENVIRONMENTS,
W70-09192 08C

NUISANCE
MILLER V MONONA COUNTY (DRAINAGE DISTRICT LIABILITY FOR NUISANCE).
W70-09493 04A

NUMERICAL ANALYSIS
A NUMERICAL TECHNIQUE FOR CALCULATING THE TRANSIENT POSITION OF THE SALTWATER FRONT,
W70-09196 02L

NUTRIENTS
WATER QUALITY IN RELATION TO PRODUCTIVITY OF LAKE ASHTABULA RESERVOIR IN SOUTHEASTERN NORTH DAKOTA,
W70-09093 5C

DETERGENTS, PHOSPHATES, AND WATER POLLUTION,
W70-09388 05C

OAK RIDGE NATIONAL LABORATORY
COMPOSITION OF WATER IN CLINCH RIVER, TENNESSEE RIVER, AND WHITEOAK CREEK AS RELATED TO DISPOSAL OF LOW LEVEL RADIOACTIVE LIQUID WASTES,
W70-09194 05B

OBSTRUCTION TO FLOW
GOODMAN V UNITED STATES (FEDERAL GOVERNMENT'S LIABILITY FOR FLOOD DAMAGE).
W70-09473 04A

OCEAN CIRCULATION
CHEMICAL CHARACTERISTICS OF WATER MASSES IN THE AMERASIAN BASIN OF THE ARCTIC OCEAN,
W70-09230 02K

OCEANOGRAPHY
USE OF TRACERS IN HARBOR, COASTAL AND OCEAN ENGINEERING,
W70-09029 07B

EFFECTS OF THERMAL DISCHARGE FROM THE SAN ONOFRE NUCLEAR GENERATING STATION,
W70-09165 05C

OCEANS
USE OF TRACERS IN HARBOR, COASTAL AND OCEAN ENGINEERING,
W70-09029 07B

ODOR
ODOR CONTROL METHODS, EXPERIMENTATION AND APPLICATION,
W70-09190 05D

ODOR CONTROL
ODOR CONTROL METHODS, EXPERIMENTATION AND APPLICATION,
W70-09190 05D

ODOR EVALUATION
ODOR CONTROL METHODS, EXPERIMENTATION AND APPLICATION,
W70-09190 05D

OHIO
HOPKINS V UPPER SCIOTO DRAINAGE AND CONSERVANCY DIST (NO DAMAGES FOR IMPROPER MAINTENANCE OF DRAINAGE DISTRICT'S WATERWAYS).
W70-09057 06E

OIL WASTES
IN-PLANT WASTE REDUCTION,
W70-09316 05D

TOXICITY STUDIES WITH AN OIL-SPILL EMULSIFIER AND THE GREEN ALGA PRASINOCLADUS MARINUS,
W70-09429 05C

PRELIMINARY RESULTS OF THE EXPERIMENTS ON THE TOXICITY OF OIL COUNTERACTING AGENT (ESSO COREXIT 7664), WITH AND WITHOUT IRAQ CRUDE OIL, FOR SELECTED MEMBERS OF MARINE PLANKTON,
W70-09434 05C

OILY WATER
HYDROCARBONS IN THERMAL AREAS, NORTHWESTERN WYOMING,
W70-09108 02K

THE EFFECT OF SALINITY ON THE OXIDATION OF HYDROCARBONS IN ESTUARINE ENVIRONMENTS,
W70-09424 05B

OKLAHOMA
OKLAHOMA EX REL PHILLIPS V GUY F ATKINSON CO (INJUNCTION AGAINST DAM CONSTRUCTION).
W70-09071 06E

FLOOD PLAIN INFORMATION, COTTONWOOD CREEK, GUTHRIE, OKLAHOMA.
W70-09220 04A

ON-SITE INVESTIGATION
EFFECTS OF THERMAL DISCHARGE FROM THE SAN ONOFRE NUCLEAR GENERATING STATION,
W70-09165 05C

ON-SITE TESTS
COMPARATIVE STUDY OF THE WATER BALANCE IN THE AERATED ZONES WITH RADIO-ACTIVITE METHODS AND WEIGHABLE LYSIMETER,
W70-09263 02G

DETERMINATION OF CAPILLARY CONDUCTIVITY AND DIFFUSIVITY OF SOIL IN SITU,
W70-09282 02G

OPEN CHANNEL FLOW
SPILLWAY AND OUTLET WORKS, ROWLESBURG DAM, CHEAT RIVER, WEST VIRGINIA HYDRAULIC MODEL INVESTIGATION,
W70-09180 08B

TURBULENCE MEASUREMENTS NEAR THE FREE SURFACE OF AN OPEN CHANNEL FLOW,
W70-09208 02E

EFFECTS OF EFFLUENT AND INFLUENT SEEPAGE ON THE HYDRODYNAMIC FORCES ACTING ON AN IDEALIZED NONCOHESIVE SEDIMENT PARTICLE,
W70-09410 08B

STUDY OF EROSION IN ROADSIDE DRAINAGE CHANNELS IN NORTH CAROLINA,
W70-09455 04A

OPERATING COSTS
AN EVALUATION OF THE PROBLEMS OF SANITARY SEWER SYSTEM DESIGN,
W70-09185 08A

OPERATING FORCES
OPERATING FORCES ON SECTOR GATES UNDER REVERSE HEADS HYDRAULIC MODEL INVESTIGATION,
W70-09177 08B

OPTICAL INSTRUMENTS
AN ELECTRO-OPTICAL PROBE FOR MEASUREMENT OF SUSPENDED SEDIMENT CONCENTRATION,
W70-09026 02J

OPTIMAL MANAGEMENT
OPTIMIZATION OF WATER RESOURCES SYSTEMS BY THE GRADIENT PROJECTION AND THE CONJUGATE GRADIENT METHODS,
W70-09092 06A

OPTIMIZATION
APPLICATION OF SPECIALIZED OPTIMIZATION TECHNIQUES FOR WATER QUALITY AND QUANTITY MANAGEMENT WITH RESPECT TO PLANNING FOR THE TRINITY RIVER BASIN,
W70-09094 05G

THE OPTIMIZATION OF STORM-HOLDING TANKS A PROBLEM OF WATER POLLUTION CONTROL,
W70-09181 05G

OPTIMAL RESOURCE ALLOCATION AND SOME TECHNIQUES OF OPTIMIZATION,
W70-09182 05G

OPTIMUM DEVELOPMENT PLANS
PLANNING OUR FUTURE WATER RESOURCES,
W70-09153 06B

OREGON
WATER BUDGET OF UPPER KLAMATH LAKE SOUTHWESTERN OREGON,
W70-09250 02H

ORGANIC MATTER
THE EFFECT OF BIOLOGICAL LIFE ON THE DISSOLVED OXYGEN CONCENTRATION IN THE DELAWARE RIVER,
W70-09189 05C

EFFECTS OF SALTS AND ORGANIC MATERIALS ON THE HYDRAULIC CONDUCTIVITY OF THE SOILS,
W70-09290 02G

ORGANIC PESTICIDES
A KINETIC AND EQUILIBRIUM STUDY OF THE ADSORPTION OF THE ORGANIC INSECTICIDES CARBARYL AND PARATHION UPON SOME SOIL ORGANIC MATTER SURFACES,
W70-09184 05A

ORGANOLEPTIC PROPERTIES
ODOR CONTROL METHODS, EXPERIMENTATION AND APPLICATION,
W70-09190 05D

ORIENTED CORES
ON GEOLOGICAL AND TECHNOLOGICAL ASPECTS OF ORIENTED N-SIZE CORE DIAMOND DRILLING,
W70-09028 08E

OSMOSIS
A STUDY ON PRESSURE MEMBRANE PROPERTIES IN RELATION TO CAPILLARY CONDUCTIVITY MEASUREMENTS,
W70-09279 02G

OSMOTIC ADJUSTMENT
EFFECT OF VARIATIONS IN SUBSTRATE SALINITY ON THE WATER BALANCE AND IONIC COMPOSITION OF BEAN LEAVES,
W70-09144 02I

MINERAL METABOLISM OF HALOPHYTES,
W70-09147 02I

OSMOTIC PRESSURE
EFFECT OF VARIATIONS IN SUBSTRATE SALINITY ON THE WATER BALANCE AND IONIC COMPOSITION OF BEAN LEAVES,
W70-09144 02I

MINERAL METABOLISM OF HALOPHYTES,
W70-09147 02I

MEASUREMENT OF WATER POTENTIAL AND OSMOTIC POTENTIALS IN SOIL WITH A COMBINED THERMOCOUPLE PSYCHROMETER AND SALINITY SENSOR,
W70-09364 02G

OUTLET WORKS
SPILLWAY AND OUTLET WORKS, ROWLESBURG DAM, CHEAT RIVER, WEST VIRGINIA HYDRAULIC MODEL INVESTIGATION,
W70-09180 08E

OVERFLOW
LAVIS V CITIES SERVICE OIL CO (LIABILITY FOR DAMAGES CAUSED BY OIL POLLUTION).
W70-09243 06E

OVERVOLTAGE
TRANSIENT OVERVOLTAGE ON A BIPOLAR HVDC OVERHEAD LINE CAUSED BY DC LINE FAULTS,
W70-09018 08C

OWNERSHIP OF BEDS
HONEBEIN V MONTICELLO (DEED TO LAKE FRONTAGE AS NOT EXTENDING OWNERSHIP TO LAKE BED).
W70-09054 06E

CARTER OIL CO V WATSON (BOUNDARY DISPUTE WHERE LAND CONVEYED BORDERED ON A STREAM).
W70-09077 06E

PIKE RAPIDS POWER CO V MINNEAPOLIS ST P AND S S M RY (RELATIVE RIGHTS TO RIVER BED AS BETWEEN BRIDGE OWNER AND DAM OWNER).
W70-09081 06E

ANDERSON V HOBBS TIE AND TIMBER CO (TITLE TO BRIDGE RESTING UPON RIVER BED).
W70-09159 06E

BLASK V SOWL (OWNERSHIP OF ISLANDS IN NAVIGABLE WATERS).
W70-09175 06E

UNITED STATES V ALASKA (RELATIVE RIGHTS IN SUBMERGED LAND).
W70-09242 06E

BRANT LAKE SHORES, INC V BARTON (ADVERSE POSSESSION OF LAND BELOW THE HIGH WATER MARK).
W70-09355 06E

BEARE'S ERIE BASIN V NEW YORK (RIGHTS TO COMPENSATION AWARD BASED ON OWNERSHIP OF LANDS CONDEMNED).
W70-09463 06E

UNITED STATES V OTLEY (OWNERSHIP OF LAKE BEDS).
W70-09467 06E

OXIDATION
BAFFLED BIOLOGICAL BASIS FOR TREATING POULTRY PLANT WASTES,
W70-09520 05D

THE EFFECT OF SALINITY ON THE OXIDATION OF HYDROCARBONS IN ESTUARINE ENVIRONMENTS,
W70-09424 05B

OXIDATION LAGOONS
FORAGE CROP IRRIGATION WITH OXIDATION POND EFFLUENT,
W70-09423 05D

MICROBIOLOGY OF A WASTE STABILIZATION POND,
W70-09508 05D

OXYGEN CONSUMPTION
PHYSIOLOGICAL RESPONSES TO TEMPERATURE AND DESICCATION IN THE ENDEMIC NEW MEXICO PLETHODONTIDS, PLETHODON NEOMEXICANUS AND ANEIDES HARDII,
W70-09145 02I

OXYGEN SAG
THE EFFECT OF BIOLOGICAL LIFE ON THE DISSOLVED OXYGEN CONCENTRATION IN THE DELAWARE RIVER,
W70-09189 05C

OYSTER CONTAMINATION
GIBSON V CITY OF TAMPA (POLLUTION OF OYSTER BEDS BY UNTREATED MUNICIPAL SEWAGE).
W70-09485 05B

OYSTERS
GIBSON V CITY OF TAMPA (POLLUTION OF OYSTER BEDS BY UNTREATED MUNICIPAL SEWAGE).
W70-09485 05B

PACIFIC NORTHWEST U
WATERSHED HUMAN-USE LEVEL AND WATER QUALITY,
W70-09240 05E

PADDY RATOONS
PADDY RATOONS,
W70-09501 03F

PALEOCLIMATOLOGY
REASONS FOR CLIMATIC CHANGES IN THE GEOLOGICAL PAST,
W70-09102 02B

CLIMATIC OSCILLATIONS 1200-2000 A D,
W70-09224 02B

PAMPEAN SOILS
HYDROLOGICAL CONSTANTS OF PAMPEAN SOILS BROWN PRAIRIE AND BLACK PRAIRIE,
W70-09287 02G

PARK MANAGEMENT
THE IMPORTANCE OF WATER RELATED ACTIVITIES AT STATE PARKS IN MISSISSIPPI,
W70-09259 06B

PARKS
THE IMPORTANCE OF WATER RELATED ACTIVITIES AT STATE PARKS IN MISSISSIPPI,
W70-09259 06B

PATENTS
THOMAS B BISHOP CO V SANTA BARBARA COUNTY (MEANDER LINES AS BOUNDARIES).
W70-09082 06E

PATH OF POLLUTANTS
COMPOSITION OF WATER IN CLINCH RIVER, TENNESSEE RIVER, AND WHITEOAK CREEK AS RELATED TO DISPOSAL OF LOW LEVEL RADIOACTIVE LIQUID WASTES,
W70-09194 05B

USE OF TOPOLOGIC INFORMATION IN PROCESSING DATA FOR CHANNEL NETWORKS,
W70-09204 07C

DISPERSION IN HOMOGENEOUS ESTUARY FLOW,
W70-09217 02L

PAYMENT
BERGER V OHISON (NO ABSOLUTE RIGHT TO TOLL FREE USE OF GOVERNMENT CONTROLLED DOCK).
W70-09469 06E

PEARL RIVER(MISS)
A SYSTEM APPROACH FOR THE STUDY AND CONTROL OF FACTORS AFFECTING WATER POLLUTION,
W70-09422 05B

PENNSYLVANIA
ACKERMAN V TOWNSHIP OF NORTH HUNTINGDON (MUNICIPAL AUTHORITY TO GRANT RIGHTS IN PRIVATELY OWNED SEWER LINE).
W70-09053 06E

CITY OF PHILADELPHIA V STANDARD OIL CO (USE OF PUBLIC BULKHEAD BY RIPARIAN OWNER).
W70-09483 04A

PERCOLATION
REDISTRIBUTION OF MOISTURE AFTER INFILTRATION IN DRY SOILS. INFLUENCE OF GRAVITY,
W70-09299 02G

A STUDY OF REDISTRIBUTION AFTER THE FINISH OF HORIZONTAL INFILTRATION (FRENCH),
W70-09304 02G

PERFORMANCE
FLOW OF ENTRAINED AIR IN CENTRIFUGAL PUMPS,
W70-09023 08C

EFFECT OF RECIRCULATION ON DEEP TRICKLING FILTER PERFORMANCE,
W70-09321 05D

THE SEASONAL PERFORMANCE AND THE PATTERNS OF CHEMICAL AND BIOLOGICAL EVENTS IN SEWAGE LAGOONS,
W70-09333 05D

TREATMENT OF DAIRY MANURE BY LAGOONING,
W70-09335 05D

PERIPHERAL NERVES
TEMPERATURE-DEPENDENT CHARACTERISTICS OF PERIPHERAL NERVES EXPOSED TO DIFFERENT THERMAL CONDITIONS IN THE SAME ANIMAL,
W70-09160 05C

PERMAFROST
CHARACTERISTICS OF PERMAFROST AND OF THE ACTIVE LAYER IN WEST SIBERIA,
W70-09257 02C

GEOPHYSICAL STUDIES IN PERMAFROST REGIONS IN THE U.S.S.R.,
W70-09356 07B

PERMEABILITY
REDUCTION OF SEEPAGE LOSSES FROM IRRIGATION CANALS AS A RESULT OF SILTING,
W70-09043 03F

THE DETERMINATION OF THE TRANSPORT COEFFICIENTS OF CELLULOSE ACETATE MEMBRANES,
W70-09357 03A

A COMPACTION THEORY FOR MODIFIED REVERSE OSMOSIS MEMBRANES,
W70-09358 03A

COMPACTION OF CELLULOSE ACETATE MEMBRANES,
W70-09359 03A

PERMITS
MIAMI BEACH JOCKEY CLUB, INC V DERN (GOVERNMENT CONTROL OVER CONSTRUCTIONS TO NAVIGATION).
W70-09478 06E

PERMSELECTIVE MEMBRANES
DESIGN AND CONSTRUCTION SYSTEM FOR THE DETERMINATION OF TRANSPORT AND COMPACTION COEFFICIENTS OF REVERSE OSMOSIS MEMBRANES,
W70-09356 03A

A COMPACTION THEORY FOR MODIFIED REVERSE OSMOSIS MEMBRANES,
W70-09358 03A

COMPACTION OF CELLULOSE ACETATE MEMBRANES,
W70-09359 03A

PESTICIDE KINETICS
A KINETIC AND EQUILIBRIUM STUDY OF THE ADSORPTION OF THE ORGANIC INSECTICIDES CARBARYL AND PARATHION UPON SOME SOIL ORGANIC MATTER SURFACES,
W70-09184 05A

PESTICIDES
PROCEEDINGS WORKSHOP ON MOSQUITO CONTROL IN NORTH CAROLINA,.
W70-09421 06G

PHENOLS
KINETIC ASPECTS OF THE TREATMENT OF PHENOLIC WASTES,
W70-09506 05D

PHOSPHATES
EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
W70-09186 05D

DETERGENTS, PHOSPHATES, AND WATER POLLUTION,
W70-09388 05C

PHOSPHORUS
EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
W70-09186 05D

A STATEMENT ON PHOSPHORUS,
W70-09325 05D

PHOSPHORUS REMOVAL WITH FERRIC IRON AND ALUMINUM,
W70-09507 05D

PHOSPHORUS COMPOUNDS
EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
W70-09186 05D

PHOSPHORUS REMOVAL
EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
W70-09186 05D

PHOSPHORUS REMOVAL WITH FERRIC IRON AND ALUMINUM,
W70-09507 05D

PHYSIOLOGICAL ECOLOGY
PHYSIOLOGICAL RESPONSES TO TEMPERATURE AND DESICCATION IN THE ENDEMIC NEW MEXICO PLETHODONTIDS, PLETHODON NEOMEXICANUS AND ANEIDES HARDII,
W70-09145 02I

THE TERRESTRIAL ECOLOGY OF THE SPADEFOOT TOAD SCAPHIOPUS HAMMONDII,
W70-09146 02G

HEART RATE AND CHANGES IN BODY FLUIDS IN AESTIVATING TOADS FROM XERIC HABITATS,
W70-09148 02I

WATER ECONOMY OF THE GREEN-TAILED TOWHEE (CHLORURA CHLORURA),
W70-09149 02I

THE TEMPERATURE SELECTION OF SMALL HYPOPHYSECTOMIZED GOLDFISH, (CARASSIUS AURATUS L.),
W70-09151 05C

PILOT PLANT
CATTLE SKIN TANNERY WASTES TREATMENT IN A COMPLETELY MIXED ACTIVATED SLUDGE PILOT PLANT,
W70-09324 05D

PILOT PLANTS
TREATMENT OF DAIRY MANURE BY LAGOONING,
W70-09335 05D

PIPE FLOW
ZONE LENGTHS OF AIR EMULSION IN WATER DOWNSTREAM OF THE RING JUMP IN PIPES,
W70-09022 08B

PIPE LININGS
ABOUT THE ROUGHNESS PROBLEM IN PIPES AND TUNNELS,
W70-09011 08B

PIPELINES
ACKERMAN V TOWNSHIP OF NORTH HUNTINGDON (MUNICIPAL AUTHORITY TO GRANT RIGHTS IN PRIVATELY OWNED SEWER LINE).
W70-09053 06E

PIPES
ABOUT THE ROUGHNESS PROBLEM IN PIPES AND TUNNELS,
W70-09011 08B

TURBULENT DIFFUSION IN A STABLY STRATIFIED SHEAR LAYER,
W70-09173 08B

AQUIFER SIMULATION ON SLOW TIME RESISTANCE-CAPACITANCE NETWORKS,
W70-09226 02F

SIPHONS
TIDAL PHENOMENA IN THE KARSTIC WATER LEVEL,
W70-09368 02F

SITE SELECTION
ELECTRIC POWER - IMPACT ON THE ENVIRONMENT,
W70-09020 06B

SLOPE POSITION
EFFECT OF SOIL PROFILE TYPE AND FERTILIZER ON MOISTURE USE BY WHEAT GROWN ON FALLOW OR STUBBLE LAND,
W70-09139 03F

SLOPES
EFFECT OF SOIL PROFILE TYPE AND FERTILIZER ON MOISTURE USE BY WHEAT GROWN ON FALLOW OR STUBBLE LAND,
W70-09139 03F

SLUDGE DISPOSAL
DIGESTED SLUDGE DISPOSAL ON CROP LAND,
W70-09328 05D

DEGRADATION OF WASTE WATER ORGANICS IN SOIL,
W70-09329 05E

TREATMENT AND SLUDGE DISPOSAL OF WASTES FROM THE MANUFACTURE OF ACTIVATED CARBON,
W70-09339 05D

SLUDGE TREATMENT
REDUCING WASTE ACTIVATED SLUDGE VOLUME BY ANEROBIOSIS,
W70-09187 05D

TREATMENT AND SLUDGE DISPOSAL OF WASTES FROM THE MANUFACTURE OF ACTIVATED CARBON,
W70-09339 05D

SLUDGE WORMS
THE EFFECT OF BIOLOGICAL LIFE ON THE DISSOLVED OXYGEN CONCENTRATION IN THE DELAWARE RIVER,
W70-09189 05C

SLUICES
SPILLWAY AND OUTLET WORKS, ROWLESBURG DAM, CHEAT RIVER, WEST VIRGINIA HYDRAULIC MODEL INVESTIGATION,
W70-09180 08B

SLURRIES SEDIMENTATION
POLYMER PLUS MAGNETIC FIELD USED TO TREAT PARAMAGNETIC SLURRIES,
W70-09318 05D

SNAILS
COMPARATIVE STUDIES OF THE MOLLUSCICIDAL EFFECT OF CUPROUS CHLORIDE AND COPPER SULFATE IN IRAN,
W70-09432 05C

SNOW SURVEYS
PREPARATORY REPORT OF THE TECHNICAL SUBCOMMITTEE ON SNOW.
W70-09351 02C

EXPERIENCES WITH SNOW PILLOWS IN NORWAY,
W70-09375 02C

SNOWMELT
RUNOFF SYNTHESIS FOR RAIN-ON-SNOW BASIN,
W70-09027 02E

SOIL CHEMICAL PROPERTIES
INFRARED SPECTROPHOTOMETRIC STUDY OF WET CLAY SOILS (FRENCH),
W70-09293 02G

SOIL CHEMISTRY
EFFECTS OF SALTS AND ORGANIC MATERIALS ON THE HYDRAULIC CONDUCTIVITY OF THE SOILS,
W70-09290 02G

SOIL CLASSIFICATIONS
EVALUATION OF SOIL MOISTURE MEASUREMENTS IN OKLAHOMA AS SOIL CHARACTERISTICS FOR CLASSIFICATION,
W70-09377 02G

SOIL CONSERVATION
SOIL, WATER AND SUBURBIA.
W70-09188 06B

SOIL DIFFUSIVITY
ANALYSIS OF SOME FACTORS AFFECTING THE WATER VAPOUR DIFFUSION IN SOILS,
W70-09265 02G

SOIL DISPOSAL
DEGRADATION OF WASTE WATER ORGANICS IN SOIL,
W70-09329 05E

SOIL ENGINEERING
SOIL, WATER AND SUBURBIA.
W70-09188 06B

SOIL EROSION
INFLUENCE OF RAINFALL ENERGY ON SOIL LOSS AND INFILTRATION RATES 2. EFFECT OF CLOD SIZE DISTRIBUTION,
W70-09378 02G

SOIL MANAGEMENT
SOIL, WATER AND SUBURBIA.
W70-09188 06B

THE MOVEMENT OF WATER IN SANDY SOILS AFTER PLOUGHING AT A DEPTH OF 50 CENTIMETERS,
W70-09303 02G

SOIL MOISTURE
FACTORS AFFECTING SEED GERMINATION UNDER SOIL MOISTURE STRESS,
W70-09135 02I

THE EFFECT OF SOIL MOISTURE LEVEL ON THE INCIDENCE OF EARLY BLIGHT ON POTATO AND TOMATO PLANTS,
W70-09137 02I

ON THE ADHESION OF PORE WATER IN FINNISH ARGILLACEOUS SEDIMENTS OF DIFFERENT AGE,
W70-09195 02G

COMPARATIVE STUDY OF THE WATER BALANCE IN THE AERATED ZONES WITH RADIO-ACTIVITE METHODS AND WEIGHABLE LYSIMETER,
W70-09263 02G

MEASURING SOIL MOISTURE IN THE ERENIG CATCHMENT PROBLEMS OF USING NEUTRON SCATTER EQUIPMENT IN SOIL WITH PEATY LAYERS,
W70-09264 02G

SOME METHODS FOR THE DETERMINATION OF SOIL MOISTURE AND BALANCE MEASURING,

SOIL MOISTURE PRESSURE IN SOME CLIMATIC ZONES,
W70-09291 02G

AN EMPIRICAL EXPRESSION FOR THE DESORPTION CURVE,
W70-09292 02G

INFLUENCE OF SOIL STRUCTURE ON INFILTRATION AND PF VALUES OF CHERNOZEM AND CHERNOZEMLIKE DARK MEADOW SOILS,
W70-09294 02G

EVALUATION OF SOIL MOISTURE MEASUREMENTS IN OKLAHOMA AS SOIL CHARACTERISTICS FOR CLASSIFICATION,
W70-09377 02G

SOIL MOISTURE METERS
AN INSTRUMENT FOR MEASURING SOIL MOISTURE BY NEUTRON SCATTERING,
W70-09265 07B

CHANGES IN THE MOISTURE CONTENT OF THE TOPSOIL AS MEASURED WITH A NEUTRON MOISTURE GAUGE,
W70-09266 02G

THE DETERMINATION OF SOIL MOISTURE WITH THE NEUTRON SCATTERING METHOD IN FINLAND,
W70-09267 07B

NEUTRON MOISTURE METER FOR SALINE SOILS,
W70-09268 07B

MEASUREMENT OF SOIL MOISTURE FROM THE TEMPERATURE GRADIENT,
W70-09269 07B

POLISH ISOTOPE APPARATUS FOR RESEARCH ON SOIL MOISTURE,
W70-09271 07B

NUCLEAR TECHNIQUES IN HYDROLOGICAL INVESTIGATIONS IN THE UNSATURATED ZONE,
W70-09272 07B

CALIBRATION AND EVALUATION OF A WILD RANGE METHOD FOR MEASURING MOISTURE STRESS IN FIELD SOIL SAMPLES,
W70-09273 07B

HYDRAULIC AND PRESSURE HEAD MEASUREMENT WITH STRAIN GAUGE PRESSURE TRANSDUCERS,
W70-09274 07B

DIRECT MEASUREMENT OF MOISTURE POTENTIAL A NEW TECHNIQUE,
W70-09275 07B

EVALUATION OF SOIL MOISTURE MEASUREMENTS IN OKLAHOMA AS SOIL CHARACTERISTICS FOR CLASSIFICATION,
W70-09377 02G

A GAMMA-PHOTONEUTRON METHOD FOR LABORATORY STUDIES OF SOIL WATER,
W70-09382 02G

MEASUREMENT OF WATER POTENTIAL AND OSMOTIC POTENTIALS IN SOIL WITH A COMBINED THERMOCOUPLE PSYCHROMETER AND SALINITY SENSOR,
W70-09384 02G

SOIL MOISTURE MOVEMENT
DIFFUSIVITY DETERMINATION BY A NEW OUTFLOW METHOD,
W70-09278 07B

SOIL MOISTURE REDISTRIBUTION
A STUDY OF REDISTRIBUTION AFTER THE FINISH OF HORIZONTAL INFILTRATION (FRENCH),
W70-09304 02G

SOIL MOISTURE REGIME
HYDROPHYSICAL PROPERTIES AND MOISTURE REGIME IN THE UNSATURATED ZONE,
W70-09261 02G

SOIL ORGANIC MATTER
A KINETIC AND EQUILIBRIUM STUDY OF THE ADSORPTION OF THE ORGANIC INSECTICIDES CARBARYL AND PARATHION UPON SOME SOIL ORGANIC MATTER SURFACES,
W70-09184 05A

SOIL PHYSICAL PROPERTIES
THE RELATION BETWEEN LITHOLOGICAL PROPERTIES AND THE SHAPE OF THE DESCRIPTION CURVE,
W70-09288 02G

INFILTRATION PROPERTIES OF THE SOILS OF THE CENTRAL CHERNOZEM PROVINCES,
W70-09313 02G

AN APPROXIMATE METHOD FOR DETERMINING THE HYDRAULIC CONDUCTIVITY FUNCTION OF UNSATURATED SOIL,
W70-09342 02G

SOIL PRESSURE
FOUNDATION SETTLEMENT AND GROUND REACTION CALCULATIONS USING A DIGITAL COMPUTER,
W70-09036 08D

SOIL PROPERTIES
HYDROLOGICAL CONSTANTS OF PAMPEAN SOILS BROWN PRAIRIE AND BLACK PRAIRIE,
W70-09287 02G

THE MICROHYDROLOGICAL CHARACTERIZATION OF SOILS,
W70-09289 02G

INFILTRATION RATE AS RELATED TO HYDRAULIC CONDUCTIVITY, MOISTURE DEFICIT AND OTHER SOIL PROPERTIES,
W70-09300 02G

INFILTRATION PROPERTIES OF THE SOILS OF THE CENTRAL CHERNOZEM PROVINCES,
W70-09313 02G

SOIL STABILIZATION
SOIL, WATER AND SUBURBIA.
W70-09188 06B

SOIL STRENGTH
RHEOLOGICAL AND ULTIMATE STRENGTH PROPERTIES OF COHESIVE SOILS,
W70-09452 08D

SOIL STRUCTURE
INFRARED SPECTROPHOTOMETRIC STUDY OF WET CLAY SOILS (FRENCH),

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 23
DECEMBER 1, 1970

W70-09511 -- W70-10033

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 23
DECEMBER 1, 1970

W70-09511 -- W70-10033

of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publicatior. and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CALE EFFECTS IN THE PHYSICAL MODEL-NG OF SURFACE RUNOFF,
lassachusetts Inst. of Tech., Cambridge. Dept. of ivil Engineering.
ictor M. Graveto, and Peter S. Eagleson.
lassachusetts Institute of Technology, ydrodynamics Laboratory Report No 120, ebruary 1970. 328 p, 115 fig, 29 tab, 48 ref, ap-end.

escriptors: *Model studies, *Rainfall-runoff rela-onships, *Hydraulic models, *Hydraulic militude, Analytical techniques, Prototype tests, oughness (Hydraulic), Viscosity, Gravity, Wetta-ility, Surface tension, Computer programs.
lentifiers: Model scale-effects, Kinematic wave heory.

he feasibility of scale modeling of the rainfall-sur-ace runoff process was investigated using a plane, npermeable model and an analytical prototype. he dynamic similarity criteria of previous in-estigators were examined and a new similarity arameter describing the influence of surface ten-ion and surface wettability is introduced. The con-rollable similarity parameters were varied in a ystematic way to evaluate scale effects through a omparison of the model and prototype hydro-raphs in dimensionless form. Surface tension ef-ects were studied using materials of different vettability and by coating the surface of the vatershed with wetting agent solutions. Surface oughness effects were studied using smooth and androughened surfaces. It is possible to select nodel materials and operating conditions such that mall scale models can be used to study overland low with acceptable accuracy. (Knapp-USGS)

CHANGING CLIMATE,
Rand Corp., Santa Monica, Calif.
I. O. Fletcher.
Rand Corporation, Paper P-3933, September 1968. 27 p, 60 ref.

Descriptors: *Climates, *Air circulation, *Precipitation (Atmospheric), *Air temperature, Ice, Water temperature, Rainfall, Fishing, Humidity, Arctic, Winds, Heat transfer, Smog, Weather data, Model studies, Solar radiation, Carbon dioxide, Cloud cover, Turbidity, Evaporation, Cloud seeding, Mathematical models, Heat budget.

The fact that the global climate is changing is illustrated by the northward displacement of the ice boundary during the first three decades of this century. Both the general vigor of the global atmospheric circulation and the variations of sea surface temperatures in response to changing atmospheric circulation are connecting factors that make possible a rational description of global climate. Other variations that cause climate differences involve changes in the zone of cold water at the equator, the extent of ice on the ocean, the degree of atmospheric dirtiness, and the rotation rate of the earth on its axis. Man is inadvertently influencing global climate by his increased CO2 production causing global warming called the 'greenhouse effect'. A 10% change in CO2 can be compensated by a 3% change in water vapor or a 1% change in mean cloudiness. Recent global cooling shows that this has already occurred. Other man-made climatic influences include smog, aircraft exhaust, and ship fuel releases. Purposeful influencing of global climate has already been achieved on a small scale; however, today's advanced technology allows for much greater achievements as the Soviet Union currently emphasizes. A LINEAR DISTRIBUTED MODEL OF CATCHMENT RUNOFF,
Massachusetts Inst. of Tech., Cambridge. Hydrodynamics Lab.
S. Bravo, A. Carlos, Brendan M. Harley, Frank E. Perkins, and Peter S. Eagleson.
Available from the NTIS as PB-194 289, $3.00 in paper copy, $0.65 in microfiche. Massachusetts Institute of Technology Hydrodynamics Laboratory Report No 123, June 1970. 147 p, 40 fig, 4 tab, 18 ref, 5 append. OWRR Project C-1069, Grant No 14-01-0001-1576.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Systems analysis, Open channel flow, Unsteady flow, Linear programming, Routing, Unit hydrographs, Computer programs, Input-output analysis, Simulation analysis, Synthetic hydrology.
Identifiers: Kinematic wave models.

A distributed linear model of direct catchment runoff simulates complex drainage areas by a network of overland flow and streamflow elements in which the one-dimensional equations for unsteady flow in a channel are assumed to govern. Solutions of these equations for suitable boundary conditions are obtained in the form of unit impulse response functions. Based on linear systems theory, any output may be estimated by performing the convolution operation between these impulse response functions and given inflows. The linear model was introduced into the M.I.T. Catchment Model as an alternative to the existing kinematic model. Results obtained with the linear model were compared with results using some non-linear solutions. (Knapp-USGS)

ISOTOPES IN HYDROLOGY.
International Atomic Energy Agency, Vienna (Austria).

Monica Krippner, Editor. Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, 1967. 740 p.

Descriptors: *Conferences, *Radioactivity techniques, *Tracers, *Tracking techniques, *Radioactive dating, Hydrology, Hydrogeology, Surface waters, Groundwater, Groundwater movement, Streamflow, Reservoirs, Seepage, Stable isotopes, Radioisotopes.
Identifiers: Isotope techniques (Hydrology).

Proceedings of a Symposium on isotopes techniques in hydrology, organized by the IAEA in co-operation with the International Union of Geodesy and Geophysics and held in Vienna, November 14-18, 1966 is presented. The meeting was attended by 167 participants from 36 countries and 7 international organizations. The topics discussed include hydrometeorology, streamflow measurements (7 papers); sediment studies (10 papers); geochronology and environmental studies (10 papers); aquifer characteristics (5 papers); unsaturated zone, seepage, tracer technology (6 papers); surface water, limnology, glaciology (3 papers). Each paper is in its original language (30 English, 9 French and 2 Russian) and is preceded by an abstract in English and one in the original language if this is not English. Discussions are in English. (See also W70-09869 thru W70-09887). (Knapp-USGS)

RAINOUT CHARACTERISTICS FOR HYDROLOGICAL STUDIES,
Illinois State Water Survey, Urbana.
G. E. Stout, and F. A. Huff.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/6, p 61-72, 1967. 12 p, 4 fig, 5 tab, 10 ref.

Descriptors: *Fallout, *Rainfall, *Tracers, *Strorms, *Tracking techniques, Data collections, Sampling, Radioisotopes.
Identifiers: Rainout.

During a 4-yr period extensive areal and time sampling was performed of the radioactivity in rainwater in central United States of America. Many surface observations and some airborne water collections were made. It is evident from the data that great variations in rainout are likely during convective storm periods and that those engaged in atmospheric tracer studies must exercise extreme care in the interpretation of observational data because of the natural variability in such storms. Analyses of spatial variability showed a trend for the relative variability of radioactive rainout to: (1) exceed the storm rainfall variability, (2) decrease with increasing rainfall volume and storm duration, and (3) increase with increasing network size. Point representativeness indicating an average error of 20-25% is introduced when a single observation is assumed to represent the mean rainout over areas of 10-12 square miles. The rainout on 26 May, 1965 after the Chinese bomb test is used illustrate the distribution of rainout in time and space over a small network of five recording air-and water-sampling sites in an area of 36 square miles. Airborne observations are also discussed. A classification of the types of time distributions of rainout is proposed, based upon a large sample of observational data. RAINFALL RELIABILITY,
Sheffield Univ. (England). Dept. of Geography.
S. Gregory.
In Environment and Land Use in Africa, Thomas, M.F. and Whittington, G. W. (eds) Chapter 4, p 57-82, Methuen, London, 1969. 7 fig, 4 tab, 34 ref.

Descriptors: *Rainfall, *Statistical methods, *Variability, Tropical regions, Semiarid climates, Climatic data, Climatic zones.
Identifiers: *Africa, *Agricultural planning, *Climate prediction.

Various aspects of tropical African rainfall variability measurements and analyses are examined. A general relationship between mean rainfall and variance is supported but not completely confirmed by available data. It is felt that rainfall variability is best expressed in terms of a linear equation between mean and standard deviation rather than as a percentage relationship because absolute terms have greater relevance to potential agricultural needs. Higher rainfall variability in arid areas is at best a generalization with many exceptions. Rainfall data for these areas is often markedly skewed rather than normally distributed. The general concept of higher variability of tropical rainfall relative to temperate rainfall is not supported by the data. Many parts of west Africa have no higher rainfall variability than England. Annual and even monthly mean rainfall data do not provide adequate information for agricultural planning. Rainfall probability studies are urged for areas where rainfall amount is normally distributed and adequate dates are available. Appropriate statistical techniques are discussed. (Casey-Arizona)

CURRENT TRENDS IN GLACIOLOGY,
Centre National de la Recherche Scientifique, Grenoble (France). Laboratoire de Glaciologie.
L. A. Lliboutry.
Earth-Science Reviews, Vol 6, No 3, p 141-167, June 1970. 27 p, 3 fig, 1 tab, 138 ref.

Descriptors: *Glaciers, *Glaciation, Cryology, Geomorphology, Scour, Regimen, Ablation, Ice, Melting, Movement, Rheology, Snowpacks, Climatology, Erosion, Temperature.
Identifiers: *Glaciology.

Glaciology has become a broad interdisciplinary science. Major contributions to glaciology during the last five years are reviewed (131 references are given) and prognoses are made concerning lines of future research. The subjects are grouped under the following headings: (1) Field techniques; (2) Geochemistry and mass balance of polar ice caps; (3) Sliding of temperate glaciers and related problems; (4) Temperature profiles and past history of ice caps; and (5) Glacier erosion and bottom drift. ELECTRICAL CHARGES ON SNOW PARTICLES,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
D. A. Burrows, and P. V. Hobbs.
Journal of Geophysical Research, Vol 75, No 24, p 4499-4505, August 20, 1970. 7 p, 7 fig, 1 tab, 15 ref. NSF Grant GA-780.

Descriptors: *Snow, *Precipitation (Atmospheric), *Cloud physics, *Electrical properties, *Snowfall, Crystals, Storms, Weather, Air temperature, Lightning.
Identifiers: Electric charges (Particles).

Measurements of the charges on individual airborne snow particles showed that they were distributed approximately symmetrically between positive and negative values. The majority of the small charges were negative, however, and the majority of the large charges were positive. The magnitudes of the positive (or the negative) charges tended to follow a log-normal distribution. The mirror image relationship between the sign of the net charge carried by precipitation and the sign of the atmospheric potential gradient was generally found to hold, but some exceptions were noted. Even in the exceptional cases, however, changes in the atmospheric potential gradient affected the distribution of charges. (Knapp-USGS)

dentifiers: Ice compressibility.

he isothermal compressibilities of ice and parally and fully saturated sand and silt at -10 deg ere determined in a piston-die device with which uniaxial load is imposed on a lead encapsulated ecimen, resulting in the hydrostatic compression f the test specimen. Pressures to 30 kbars were obined. The compressibility of ice is as reported by .W. Bridgman. The various phase transformations f ice I to water ice VI to ice VIII appear as exected. It is shown that the compressibility of rozen soil can be readily predicted from the nowledge of material properties such as degree of aturation with ice, porosity, and the compressibilies of the ice and mineral components. AN INSTRUMENTED EXPERIMENTAL SITE FOR THE INVESTIGATION OF SOIL MOISTURE, FROST, AND GROUNDWATER DISCHARGE,
Department of Energy, Mines and Resources, Otawa (Ontario). Inland Waters Branch.
R. A. Freeze, and J. A. Banner.
Canada Inland Waters Branch Report Series No 3, Department of Energy, Mines and Resources, 970. 29 p, 16 fig, 21 ref.

Descriptors: *Soil water movement, *Groundwater novement, *Frost, Freezing, Thawing, Saturated low, Unsaturated flow, Recharge, Surface-groundwater relationships, Base flow, Runoff, Water yield, nstrumentation, Infiltration, Hydrogeology, Data collections.
dentifiers: Calgary (Alberta, Canada).

An instrumented experimental site at Calgary, Alberta, Canada provides integrated measurements of the subsurface moisture regime in both the saturated and unsaturated zones. A soil-moisture measuring system utilizing both resistance cells and a neutron probe has advantages over single-instrument systems, particularly in the determination of frost and winter soil-moisture conditions. The site is in a regional groundwater recharge area. The vertical, saturated, hydraulic gradient is 0.45, and it remains remarkably constant through the year. Two mechanisms lead to water-table rises at the site: a direct vertical infiltration to the water table through the unsaturated zone, and a depression-focused recharge involving horizontal infiltration from a nearby slough. Frost formation occurs slowly from the surface down. An ice-water mixture precedes complete freezing. The spring thaw is more rapid but there is a significant remnant of the frost wedge in the ground at the time of peak snowmelt runoff. (Knapp-USGS)

WATER BUDGET ACCOUNTING ON TWO CORN-CROPPED WATERSHEDS,
Agricultural Research Service, Brookings, S. Dak.
C. A. Onstad, and T. C. Olson.
Journal of Soil and Water Conservation, Vol 25, No 4, p 150-152, July-August 1970. 3 p, 3 fig, 5 tab.

Descriptors: *Water balance, *Corn (Field), *Evapotranspiration, Demonstration watersheds, Consumptive use, Soil moisture, Water storage, Water yield, Water conservation, Stubble mulching, Land management, Infiltration, Runoff, Soil-water-plant relationships, Water management (Applied).
Identifiers: Madison (S. Dak.).

The growing-season water budget components of two small corn-cropped watersheds in South Dakota were quantified over a 3-year period. The watersheds normall receive about 20 inches of rain between April 1 and October 31, little of which runs off. Most of the moisture evaporates or transpires. Evaporative demand is highest during June, July, and August, when a loss as much as four times the precipitation creates a moisture stress on corn during its critical growth period. Study data show that corn stover left as surface cover substantially increased the water retained on the watershed. (Knapp-USGS)

TRANSPIRATION OF SUGAR BEET,
Research Inst. of Irrigation Management, Bratislava (Czechoslovakia).
Vladimir Slama.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 748-759, 1968. 12 p, 7 tab.

Descriptors: *Evapotranspiration, *Water balance, *Sugar beets, Transpiration, On-site tests, Meteorology, Hydrologic budget, Solar radiation, Consumptive use, Moisture content, Soil-water-plant relationships.
Identifiers: Czechoslovakia.

The water requirement of sugar-beet plants was determined at the experimental station at Cakovice near Prague, Czechoslovakia during 1957-1960. In field experiments the balance of soil water was measured at intervals of three or four days during the vegetation period. The smoothed values of the consumptive use were the principal data for expressing the water requirement of sugar-beet in relation to meteorological factors through coefficients applied to the saturation deficit, evaporation and intensity of solar radiation. The consumptive use is expressed for ten-day periods and for periods in which the sum of mean daily temperatures is equal to 200 deg C. The coefficients were used for evaluating the quantity of irrigation water needed for sugar beet, and the measured changes in soil water content agreed well with those calculated. The method should be satisfactory in other regions. (See also W70-09715 and W70-09568 thru W70-09592) (Knapp-USGS)
W70-09714

THE REGULARITIES OF GROUNDWATER EVAPORATION IN IRRIGATION LANDS OF THE ARID ZONE,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
D. M. Katz.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium,

The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 822-827, 1968. 6 p, 3 tab, 2 ref.

Descriptors: *Evaporation, *Arid lands, *Lysimeters, Irrigation, Irrigation water, Irrigation programs, Water demand, Consumptive use, Groundwater movement, Soil water movement, Surface-groundwater relationships.
Identifiers: *Groundwater evaporation, Soil water-groundwater relationships.

Lysimeter data are compiled for groundwater discharge and evaporation and transpiration from different types of ground surface (both land without vegetation and with cotton, alfalfa, maize and other irrigated crops). The investigations cover soils of various texture under semidesert and desert climatic conditions, with the water table at a depth of 0.5 to 3 meters. The results of mathematical treatment of the observation data are presented and pertinent regularities are established. (See also W70-09722 and W70-09568 thru W70-09592) (Knapp-USGS)
W70-09721

INFLUENCE OF TRANSPIRATION SUPPRESSANTS, SPRINKLER IRRIGATION AND MOISTURE LEVELS ON TRANSPIRATION AND EVAPOTRANSPIRATION,
Texas A and M Univ., College Station.
C. J. Gerard, and B. W. Hipp.
Available from the NTIS as PB-194 238, $3.00 in paper copy, $0.65 in microfiche. Texas A and M University Water Resources Institute Technical Report No 27, May 1970. 101 p, 33 fig, 36 tab, 29 ref. OWRR Project No B-033-TEX (1).

Descriptors: *Evapotranspiration control, *Sprinkler irrigation, Water utilization, Water yield improvement, Water conservation, Tomatoes, Citrus fruits, Texas.
Identifiers: Transpiration suppression.

Light sprinkler cooling water applications and white acrylic paint were applied to leaf canopies of tomatoes and citrus to attempt to reduce evapotranspiration. Moisture use, yields, and microclimatic data were determined. Estimates of influences of treatments on transpiration were evaluated with thermoelectric sensors. Tomato and citrus plant parts were analyzed for chemical effects of treatment. Diurnal changes in citrus tree trunks and fruits were monitored with linear variable displacement transducers. In 1968, the effects of treatments on water use were small and inconclusive. The white reflective treatment reduced water use by tomatoes by 10%, but reduced yields by 30% in 1969. Evaporative cooling increased yields of tomatoes in 1968 and 1969. In 1968, evaporative cooling increased total citrus yields and increased the tonnage of fruits which could be sold to fresh market. Evaporative cooling was effective in influencing fruit quality and size, and offers the promises of increasing the yield of quality produce and of making more efficient use of water. (Knapp-USGS)

A SIMPLE ENERGY BALANCE APPROACH TO THE MOISTURE BALANCE CLIMATOLOGY OF AFRICA,
McMaster Univ., Hamilton (Ontario). Dept. of Geography; and King's Coll., London (England). Dept. of Geography.
J. A. Davies, and P. J. Robinson.
In Environment and Land Use in Africa, Thomas, M. F. and Whittington, G. W. (Eds), Chapter 3, p 23-56, Methuen and Company, London, 1969. 33 fig, 4 tab, 42 ref.

Descriptors: *Climatic data, *Solar radiation, *Precipitation (Atmospheric), *Evapotranspiration, *Convection, Evaporation, Ecology, Latent heat, Advection, Climatic data, Climatic zones
Identifiers: *Potential water loss, *Africa, *Oasis effect, *Nigeria, *Bowen ratio, Net radiation, Climatic stations, Pans, Heating coefficient, Forest-savannah boundary.

Starting with the assumption that the ecologically significant climatic parameters are energy and moisture balances, the two are linked in theoretical and empirical equations so that measurements of one will have predictive value for the other. Net radiation (RN) at the Earth's surface is approximately equal to evaporation and sensible heat flux. Potential evapotranspiration (PE) then equals RN divided by the latent heat of vaporization of water. The potential water loss (ER) is the difference between rainfall (P) and PE in a given year, flecting either a water surplus or deficit with respect to a given crop and therefore predicting needed irrigation water. Inaccuracies may occur when the oasis effect due to advection is present. Regional weather stations and other data in Nigeria on solar and long-wave radiation facilitated the development of an empirical equation for ER. Sets of plus or minus values of P-ER were plotted against latitude. It was found that P-ER = O at forest-savannah boundaries, suggesting a rational climatic explanation for the existance of these boundaries, contrary to current ecological opinion. ER and P-ER maps are given for each month in Africa over areas from which radiation data are available. (Casey-Arizona)
W70-09962

DAYTIME STOMATAL CLOSURE IN AGAVE AMERICANA AS RELATED TO ENHANCED WATER-USE EFFICIENCY,
Agricultural Research Service, Phoenix, Ariz. Water Consevation Lab.
W. L. Ehrler.
In: Physiological Systems in Semiarid Environments, Hoff, C. C. and Riedesel, M. L. (editors), p 239-247, University of New Mexico Press, 1969.

Descriptors: *Stomata, *Evapotranspiration, Plant growth, Xerophytes, Corn (Field), Water vapor, Carbon dioxide.
Identifiers: *Leaf temperatures, *Assimilation, *Leaf diffusion resistance, *Water-use efficiency, *Transpiration ratios, Mesophytes, Agave, Succulents.

In greenhouse experiments with irrigated, growing corn and agave, transpiration, leaf temperatures, and leaf diffusion resistances were measured. Daytime leaf temperatures in corn were 1-2 degrees above room temperature whileagave leaf temperatures were 8-9 degrees higher. At night corn leaves were the same as, and agave leaves slightly lower than room temperature, indicating some evaporative cooling in agave. Expressed as percentage of daylight value, dark transpiration rates were 7 percent for corn and 200 percent for agave. Leaf diffusion resistances were completely out of phase, being high in the light for agave and high in the dark for corn. Both transpiration rates and leaf diffusion resistances showed that contrary to most plants, stomatal opening in agave is uninfluenced by light and largely occurs in the dark. Mean transpiration ratios were 136.0 for corn and 70.5 for agave. Dry weight gains were about equal in the 2 species indicating that water use efficiency of agave is about twice that of corn, illustrating a general quality of succulents. (Casey-Arizona)

2E. Streamflow and Runoff

FLOOD OF JULY 22, 1969 IN THE NORTHERN VIRGINIA AREA,
Geological Survey, Richmond, Va.
E. M. Miller, and F. P. Kapinos.
US Geological Survey Open-file report, 1970. 35 p, 21 fig, 1 plate, 3 tab.

Descriptors: *Storm runoff, Floods, *Rainfall-runoff relationships, *Virginia, *Historic flood, Runoff, Streamflow, Rainfall, Precipitation (Atmospheric), Stream gages, Data collections, Hydrologic data, Urbanization, Cities.
Identifiers: *Arlington (Va), Alexandria (Va), Fairfax County (Va).

Heavy rainfall during a thunderstorm on the night of July 22, 1969, produced record flooding in parts of the Washington metropolitan area. Runoff was the highest for the period of record at gaging sites in the Virginia suburbs. There was no loss of life, but hundreds of stores, homes, and apartment buildings were flooded, principally by Fourmile Run. Peak stages and discharges are given for 15 gaging stations and 6 miscellaneous sites. (Knapp-USGS)

THE RELATIONS OF HYDROLOGY AND GEOMORPHOLOGY IN A HUMID TROPICAL STREAM BASIN - THE RIO GRANDE DE MANATI, PUERTO RICO,
National Academy of Sciences-National Research Council, Washington, D.C. Foreign Field Research Program.
Lawrence A. Lewis.
Available from NTIS as AD-679 462, $3.00 in paper copy, $0.65 in microfiche. Final Report of National Research Council, Division of Earth Sciences, 1968. 130 p, 28 fig, 5 tab, 31 ref. ONR Contract N00014-67-0244-0001.

Descriptors: *Geomorphology, *Tropical regions, *Rainfall-runoff relationships, *Puerto Rico, Wet climates, Hydrogeology, Hydrographs, Stage-discharge relations, Hydraulics, Open channel flow, Sediment transport, Channel morphology, Duration curves, Drainage patterns (Geologic).
Identifiers: Rio Grande de Manati (Puerto Rico).

This study analyzes the manner in which the channel of the Rio Grande de Manati, located in north-central Puerto Rico, changes in cross section in both the downstream direction from its source waters to its mouth and at seven individual sites along the river. The basic parameters which were measured include the stream's width, depth, velocity, bed material size, and size of drainage area. The kinds of bedrock over which the streams flow and the nature of the river bank materials were noted. These measurements were made to determine what changes occur in individual river reaches as flow conditions vary; to resolve how the variables of width, depth, and velocity change in the downstream direction at a given frequency of discharge; to ascertain what is the hydraulic geometry of the Rio Grande de Manati; and to see if the concept of dynamic equalibrium is valid in a humid tropical stream basin. DERIVING THE UNITGRAPH WITHOUT USING RAINFALL DATA,
Monash Univ., Clayton (Australia). Dept. of Mechanical Engineering.
R. J. De Laine.
Journal of Hydrology, Vol 10, No 4, p 379-390, June 1970. 12 p, 2 fig, 6 tab.

Descriptors: *Unit hydrographs, *Runoff forecasting, *Rainfall-runoff relationships, Hydrograph analysis, Routing, Linear programming, Synthetic hydrology, Simulation analysis, Hydrographs, Mathematical studies.
Identifiers: Hydrograph synthesis.

The characteristic of a linear time invariant system can be found uniquely from any two outputs that have no error; it is not necessary to know the inputs or the time duration of the system response. In hydrologic terms, the unitgraph of a catchment with linear characteristics may be found from records of runoff vs time. (Knapp-USGS)

dentifiers: Virgin River (Utah).

evere floods occurred in parts of southwestern tah on Dec. 5-6, 1966, as a result of precipitation f about 1 inch to more than 12 inches during Dec. -6. The flood on the Virgin River was the greatest ince the first settlers arrived in 1860. The peak ischarge of the Virgin River at Virgin, Utah, was 2,800 cubic feet per second on Dec. 6; this exceeded the previous maximum discharge of 13,500 cubic feet per second on March 3, 1938, and Sept. 17, 1961, and probably has a recurrence interval of 100 years. The suspended-sediment discharge during the period Dec. 5-8, 1966, at Santa Clara River above Winsor Dam, near Santa Clara was about four times greater than all the suspended-sediment discharge during the preceding 3 years; the suspended-sediment discharge of the Virgin River at Virgin was greater during the 4-day period than during any one of the preceding 3 years. Total damage in the Dixie Soil Conservation District in Washington County was about $835,000; 60% of the damage was caused by floodwater and 40% by deposited sediment. (Knapp-USGS)

SUMMARY OF FLOODS IN THE UNITED STATES DURING 1964,
Geological Survey, Washington, D.C.
J. O. Rostvedt.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C. 20402 - Price $0.60. US Geological Survey Water-Supply Paper 1840-C, 1970. 124 p, 58 fig, 29 tab, 21 ref.

Descriptors: *Floods, *United States, *Historic flood, Flood damage, Hurricanes, Rainfall, Rainfall-runoff relationships, Stage-discharge relations, Water levels, Discharge (Water), Runoff, Streamflow, Data collections, Hydrologic data.
Identifiers: U. S. Floods (1964).

This report describes the most outstanding floods in the United States during 1964. The four most damaging floods during the year were in December in the Far Western States, in March along the Ohio River, in September in central and northern Florida and southern Georgia, and in June in northwestern Montana. The floods of December in the Far Western States were the most damaging in the history of the area. Record-breaking discharges occurred in an unusually large area--Oregon, northern California, western Nevada and Idaho, and southern Washington. Two storms in early March along the Ohio River caused maximum discharges of record on many streams in Ohio, Kentucky, and Indiana and also high discharges in part of Illinois, West Virginia, and Pennsylvania. In September, Hurricane Dora, the first hurricane of record to cross northeastern Florida from the Atlantic Ocean, caused outstanding floods in northern Florida and southern Georgia. The most severe floods of record in northwestern Montana occurred on both sides of the Continental Divide following heavy rains in early June. In addition to the floods mentioned above, 21 others of lesser magnitude are listed. (Knapp-USGS)

ON THE THEORY OF LONGITUDINAL DISPERSION,
Hydronautics, Inc., Laurel, Md.
C. Elata.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1 - Microturbulent Diffusion and Dispersion), Paper D1, p 1-10, 1967. 10 p, 4 fig, 6 ref.

Descriptors: *Turbulent flow, *Dispersion, *Open channel flow, Mixing, Hydraulic radius, Turbulence, Roughness (Hydraulic), Reynolds number, Diffusion, Path of pollutants, Tracers, Tracking techniques, Mathematical studies, Streamflow.
Identifiers: Longitudinal dispersion.

A tracer injected in a uniform turbulent stream will, after a long period attain a Gaussian average-concentration distribution. A simplified conservation of mass equation, applicable to this condition, is written in orthogonal curvolinear coordinates in such a way that one of the coordinates coincides with the isovels of the stream. A general expression for the dispersion coefficient is derived, depending on the shear velocity, the hydraulic radius, the basic velocity profile and the metric coefficients of the coordinate system. This approach allows the numerical calculation of dispersion coefficients in streams in which velocities vary in the transverse as well as in the vertical direction, without a need for any additional assumptions concerning the dispersivity. Some simple calculations show that the non-dimensionalized dispersion coefficient varies only slightly with Reynolds number and boundary roughness. In elliptical channels, with various width to depth ratios, the dispersion coefficients depend heavily on the shape of the isovels. (Knapp-USGS)

ANALYTIC PREDICTION OF LONGITUDINAL DISPERSION COEFFICIENTS IN NATURAL STREAMS,
California Univ., Berkeley. Dept. of Civil Engineering.
Hugo B. Fisher.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D2, p 11-19, 1967. 9 p, 2 fig, 3 tab, 6 ref.

Descriptors: *Dispersion, *Turbulent flow, *Open channel flow, Alluvial channels, Mixing, Turbulence, Roughness (Hydraulic), Diffusion, Path of pollutants, Mathematical studies, Model studies, Mathematical models, Hydraulic models.
Identifiers: Longitudinal dispersion.

Field measurements of the longitudinal dispersion coefficient in natural streams have produced coefficients far greater than was expected from the analytic work of Taylor and Elder. The dispersive effect of the vertical gradient of downstream velocity, on which Elder's analysis was based, is overwhelmed by the far greater dispersive effect of horizontal (transverse) gradients. A method is given for predicting the dispersion coefficient of any natural stream, based on measurements of lateral velocity variations. To use the method field measurement is required of channel-sectional geometry, cross-sectional distribution of velocity, and slope. For most channels these measurements are either already available or may be easily obtained. The method has been proven accurate by a comprehensive series of laboratory experiments, and by experiments in one natural stream. (Knapp-USGS)

DIFFUSION OF WARM WATER JETS DISCHARGED HORIZONTALLY AT THE WATER SURFACE,
Chuo Univ., Tokyo (Japan). Hydraulic Lab.
Taizo Hayashi, and Nobuo Shuto.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D6, p 47-59, 1967. 13 p, 14 fig, 2 photo, 5 tab, 6 ref.

Descriptors: *Diffusion, *Mixing, *Jets, *Heated water, Open channel flow, Flow, Turbulent flow, Convection, Dispersion, Model studies, Hydraulic models.
Identifiers: Jet diffusion.

Several experiments were made on the diffusion of warm water jets discharged horizontally at the surface of initially quiescent water. The temperature was from 0.2 deg to 28 deg higher than the receiving water, the densimetric Froude numbers of the jets at an outlet varied from 16.1 to 1.4, and the Richardson numbers of the jets at the outlet varied from 0.00 to 0.54. An approximate theory was developed with the assumptions that: (1) The horizontal diffusion terms in the equation of motion equal the horizontal pressure gradient term; (2) the profiles of temperature in vertical sections are of similar form and the profiles of horizontal velocity in vertical sections are also of similar form; (3) the rate of entrainment at the bottom of the surface layer of warm water is proportional to some characteristic velocity at that vertical plane; (4) the turbulent-diffusion coefficients are constants. The experimental results were compared with the approximate theory, and the effect of Richardson number on the diffusion of warm water jet is discussed. (Knapp-USGS)

TURBULENT DIFFUSION OF THE VERTICALLY UPWARD JET,
Osaka Univ. (Japan). Dept. of Civil Engineering.
Akira Murota, and Kouji Muraoka.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D7, p 60-70, 1967. 11 p, 10 fig, 12 ref.

Descriptors: *Jets, *Mixing, *Dispersion, Diffusion, Turbulence, Turbulent flow, Velocity, Bubbles, Saline water intrusion, Estuaries, Water pollution control.
Identifiers: Vertical jets.

A water-curtain formed in a stream by a series of vertical jets from bottom to surface may be used as a barrier for the control of salinity intrusion in tidal reaches of rivers. Mixing of free jets in unbounded space is analyzed for cases of two and three dimensional jets. When the still water depth is larger than 20 times the representative length of injection nozzles, velocity decreasing along the jet axis is quite similar to that of free jets except in a stagnant region. Distributions of vertical velocity in the mixing region are given by Tollmien's theory. The proportional constant for vertical jets is about 3 times larger than that of free jets; thus nominal boundaries of vertical jets are more widely spread than those of free jets. (Knapp-USGS)

HYDROLOGY OF WATER YIELD PREDICTION: METHODOLOGY FOR WATERSHED LOW-FLOW PREDICTION,
Oregon State Univ., Corvallis. Water Resources Research Inst.
John C. Campbell.
Available from the NTIS as PB-194 240, $3.00 in paper copy, $0.65 in microfiche. Oregon State University Water Resources Research Institute Project Completion Report, June 1970. 68 p, 7 fig, 11 tab, append. Project A-001-OREG.

Descriptors: *Low flow, *Streamflow forecasting, *Oregon, *Small watersheds, Probability, Rainfall-runoff relationships, Precipitation (Atmospheric), Frequency analysis.
Identifiers: Low-flow prediction.

Methodology was developed for prediction of low flow for small watersheds. Ten years of precipitation data were collected, adjusted, and analyzed for Deer Creek, Flynn Creek, and Needle Branch, Oregon. There was no really significant correlation between seasonal low-flow quantity and precipitation quantities for any previous period of time. A probability graph, based upon related previous discharge records, proved capable of predicting low-flow watershed yields normally within a 10% error. High-elevation reservoir systems for water storage can be utilized to retain 25 to 100% of annual water yield for later release, producing virtually uniform streamflow. (Knapp-USGS)

Report available from NTIS as AD-705 625, $3.00 in paper copy, $0.65 in microfiche. Northwestern University, Department of Geological Sciences Technical Report No 13, April 1970. 118 p, 32 ref. ONR Contract 389-150 (Formerly 388-078).

Descriptors: *Geomorphology, *Drainage patterns (Geologic), *Drainage density, *Statistical models, *Topography, Geology, Structural geology, Statistical methods, Correlation analysis, Regression analysis, Joints (Geology), Erosion, Stream erosion.
Identifiers: Stream order, Drainage basin analysis, Topology.

Quantitative geomorphic measurements were made on modern 1:24,000-scale topographic maps for 90 order-3 and 90 magnitude-10 basins randomly selected from a 250 square-mile area of horizontal, homogeneous sandstones in eastern Kentucky. Operator variations were greatest in locating sources and least in measuring areas, and were readily reduced to acceptable limits by training and practice. Distributions of drainage density, relief, and outlet elevation are essentially the same in the two samples, whereas those of area, total channel length, and a shape measure are significantly narrower in the magnitude-10 sample. Simple and multiple linear correlation, and trend surface, factor, and discriminant function analyses were made to illuminate the differences between the samples, and hence between order and magnitude as the basis for classifying drainage-basin data. Similar measurements were made on 153 magnitude-5 basins in the study area. Cis and trans links have nearly equal probabilities but strongly differing length distributions. Link lengths do not vary significantly up to magnitude 1311. Total stream length and basin area are highly correlated, with a trend that supports the hypothesis that the areas draining into the sides of links ought to vary quadratically with link length in the smallest basins and directly with it in the largest. HYDROLOGIC DATA FOR EXPERIMENTAL AGRICULTURAL WATERSHEDS IN THE UNITED STATES, 1963,
Agricultural Research Service, Washington, D.C. Soil and Water Research Div.

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $4.00. Harold W. Hobbs and James B. Burford, Compilers. US Department of Agriculture Research Service Miscellaneous Publication No 1164, July 1970. 465 p, 4 tab.

Descriptors: *Hydrologic data, *Agricultural watersheds, United States, Data collections, Research and development, Watersheds (Basins), Precipitation (Atmospheric), Runoff, Air temperature, Documentation, Planning, Storm runoff, Hydrographs, Hydrologic aspects.
Identifiers: *Agricultural experiment stations.

Selected hydrologic data are presented for calendar year 1963. Included are monthly precipitation and runoff records for 168 watersheds, annual maximum discharges and volumes of runoff for 156 of the basins for time intervals of 1, 2, 6, and 12 hours and for 1, 2, and 8 days, daily precipitation and discharge and or daily air temperature on 57 watersheds and detailed data for one or more selected typical storm events for 142 watersheds. Decimal page numbering used is consistent with that used in the five previous publications, so that previous records and general descriptions can be readily consulted. State agricultural experiment stations collaborated in selecting, planning, and operation of the studies, and the U.S. Geological Survey and State and local agencies assisted in the work. (Lang-USGS)

Descriptors: *Dispersion, *Streamflow, *Turbulent flow, Turbulence, Mathematical studies, Mixing, Sediment transport, Equations, Model studies, Open channel flow.
Identifiers: Longitudinal mixing.

Dispersion in turbulent streams is described by dividing the flow into a main stream and dead zone. Two coupled partial differential equations are written as a model of the dispersion. This dead zone model is shown to improve the statistical fit of experimental concentration-time data when compared to Taylor's dispersion model. An equation is suggested to predict the dispersion coefficient in natural streams if in short uniform reaches the dead zone model is used to describe the dispersion. (Knapp-USGS)

Descriptors: *Hydraulic jump, *Diffusion, *Turbulent flow, Turbulence, Tracers, Saline water, Model studies, Laboratory tests, Hydraulic models, Stage-discharge relations, Mixing, Vortices, Turbulence, Open channel flow.
Identifiers: Turbulent diffusion.

To permit studies of the turbulent diffusion in hydraulic jump, concentration tests were made with a salt solution used as tracer. The concentration was measured by electric conductivity tests, made directly in the flow. The tests, carried out for Froude numbers 2 to 7, showed that the degree of irregularity of the distribution of mean concentration is dependent on the Froude number. Perfect mixing (degree of irregularity equal to zero) shifts towards the starting point of the hydraulic jump with increasing Froude-numbers. (Knapp-USGS)

APPLICATION OF RADIOTRACER METHODS IN STREAMFLOW MEASUREMENTS,
T. Dincer.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/8, p 93-113, 1967. 21 p, 2 fig, 12 ref.

Descriptors: *Tracers, *Radioisotopes, *Tracking techniques, *Streamflow, *Discharge measurement, Stream gages, Water measurements, Discharge (Water), Mixing, Stage-discharge relations, Tritium, Sampling, Safety, Adsorption, Water chemistry.
Identifiers: Streamflow measurement.

An attempt is made to evaluate methods using radiotracers in streamflow measurements. The basic principles of the tracer method are explained and background information given. Radiotracers used in stream discharge measurements are discussed and measurements made by different research workers are described. Problems such as adsorption of the tracer and the mixing length are discussed and the potential use of the radioisotopes as tracer in the routine stream-gaging work is evaluated. It is concluded that, at the present stage of development, radiotracer methods do not seem to be ready for routine use in stream-gaging work, and can only be used in some special cases. For gamma-emitting radioisotopes there are problems related to safety, transport and injection which should be solved. Tritium, though a very attractive tracer in some respects, has the disadvantages of having a relatively long half-life and of disturbing the natural tritium levels in the region. An attempt is made to define the objectives of the research in the field of application of radioisotopes in hydrometry. (See also W70-09868) (Knapp-USGS)

THE DRY SEASON FLOW CHARACTERISTICS OF WEST AFRICAN RIVERS,
Edinburgh Univ. (Scotland). Dept. of Forestry and Natural Resources.
D. C. Ledger.
In Environment and Land Use in Africa, Thomas, M. F. and Whittington, G. W. (editors), Chapter 5, p 82-102, Methuen, London, 1969. 8 fig, 2 tab, 9 ref.

Descriptors: *Dry seasons, *Rainfall, *River flow, *River systems, *Surface runoff, Tropical regions, Arid lands, Groundwater recharge, Floodplains.
Identifiers: *West Africa, *Intertropical convergence zone, *Niger River.

The climate of West Africa is controlled by seasonal migration of the intertropical convergence zone between 9-20 degrees north. Rainfall in maritime regions is zonal and decreases inland with latitude. An east-west geological boundary exists at 12 degrees north. The southern region consists of highland blocks while the northern region comprises vast depositional plains. Streamflow is influenced by drainage basin size. In small basins direct run-off passes the outlet point quickly and dry season flow ceases unless groundwater discharge occurs. Large rivers have similar dry season over-all flow patterns but take much longer to recede from high wet season to low dry season flow. In the rivers with large floodplains, water storage in shallow lakes during high periods and water release during low periods combine with phasic differences in wet and dry periods over widely separated parts of their courses creating compensatory effects resulting in less variable year-round flow. The Niger River is an outstanding example and flow is analyzed over its entire course. (Casey-Arizona)

Descriptors: *Hydrogeology, *Aquifers, *Kansas, Hydrologic data, Water resources, Water resources development, Data collections, Irrigation water, Water wells, Sandstones, Alluvium, Water level fluctuations, Geology.
Identifiers: Kearny County (Kans.).

Groundwater may be developed in Kearny County, Kansas, from Jurassic and Cretaceous sandstones and from Tertiary and Quaternary alluvium. The Upper Jurassic rocks consist of a fine-grained silty sandstone unit overlain by a variegated shale and dark-gray sandy shale unit. The Lower Cretaceous rocks consist of the Cheyenne Sandstone (a fine-to medium-grained sandstone interbedded with shale), the Kiowa Shale (predominantly shale interbedded with thin sandstone layers), and the Dakota Formation (a fine- to medium-grained sandstone interbedded with sandy shale and shale). The thickness of the sandstone aquifer ranges from about 350 to 500 feet. Because the aquifer includes numerous beds of shale and sandy shale and because the sandstone beds commonly are silty or tightly cemented, the yield of groundwater to wells may be sufficient only for domestic or stock supplies. The Tertiary and Quaternary deposits are hydrologically connected and are considered as one aquifer. Because these deposits consist of alternating lenses of fine- and coarse-grained alluvial sediments, groundwater movement is retarded vertically and laterally. Thus, the water-yielding capacity of the aquifer differs from one area to another, and the water may be semiconfined (semiartesian) or unconfined. The increasing use of groundwater for irrigation has resulted in a decline in water levels and a gradual loss of water in storage. (Knapp-USGS)

GROUNDWATER RESOURCE EVALUATION,
Minnesota Univ., Minneapolis. Dept. of Geology and Geophysics.
William C. Walton.
New York, N.Y., McGraw-Hill Book Company, 1970. 664 p.

Descriptors: *Groundwater, *Groundwater movement, *Hydrology, *Hydrogeology, *Water resources development, Aquifers, Water wells, Water yield, Water storage, Surveys, Investigations, Hydraulics, Hydrodynamics, Unsteady flow, Systems analysis, Mathematical models, Analog models, Water management (Applied), Water quality.
Identifiers: Aquifer testing, Pumping tests.

A textbook presents both the basic principles of groundwater resource evaluation and the practical application of techniques to well and aquifer problems. Derivation of equations as well as numerous illustrative case histories of analyses based on actual field data are presented. Numerous practical problems which may be solved with available equations, and methods of analysis are given. A comprehensive bibliography is presented containing references to the literature germane to groundwater resource evaluation. Equations and analytical methods most frequently applied to actual groundwater resource evaluation field problems are presented. They include equations and methods used to quantitatively appraise the hydrogeologic parameters affecting the water-yielding capacity of wells and aquifers, and equations and methods used to quantitatively appraise the response of wells and aquifers to heavy pumping. This book, in addition to serving as a text for groundwater courses, should aid in the systematic appraisal of groundwater resource problems by practicing engineers and geologists. (Knapp-USGS)

OPTIMAL RESOURCE USE OVER TIME WITH AN APPLICATION TO GROUNDWATER,
California Univ., Davis.
Oscar R. Burt.
Management Science, Vol 11, No 1, p 80-93, September 1964. 19 ref, 2 append.

Descriptors: *Time, *Groundwater, Decision making, Resource allocation, Supply, Dynamic programming.
Identifiers: *Optimal resource use, *Resource use, Decision rules, Storage control.

This paper is concerned with optimal allocation over time of a single resource which is either fixed in supply or only partially renewable at a point in time. Some resources which fall in this category are mineral deposits, groundwater, petroleum, wildlife, and fish. A functional equation is obtained from a dynamic programming formulation of the problem. This functional equation is used to derive approximate decision rules for resource use as a function of current supply. The results are applied to groundwater storage control and tested empirically by comparison with a decision rule obtained by detailed numerical methods. (Loeb-Rutgers)

ANALYSIS OF DATA FROM PUMPING TESTS IN UNCONFINED ANISOTROPIC AQUIFERS,
Norman S. Boulton.
Journal of Hydrology, Vol 10, No 4, p 369-378, June 1970. 10 p, 2 fig, 2 tab, 6 ref.

Descriptors: *Groundwater movement, *Transmissivity, *Data processing, Hydrologic data, Permeability, Steady flow, Unsteady flow, Drawdown, Water levels, Water table, Water Storage, Storage coefficient, Aquifers, Water level fluctuations, Water yield.
Identifiers: Pumping tests, Aquifer tests.

The errors involved in finding the coefficients of transmissibility and storage using pumping-test data are briefly discussed. Distance-drawdown data are advocated as generally most suitable for finding the transmissibility. Procedures are based on distance-drawdown analysis with constant storage coefficient and time-drawdown analysis with delayed yield from storage. Anomalies which result from well-known methods of analysis are illustrated by pumping test data. The methods described assume a fully-penetrating pumped well and shallow observation wells, except in the case of a very deep aquifer. A computer is not required. An exact equation, allowing for the vertical velocity-component of the flow and delayed yield from storage, is given. (Knapp-USGS)

SUMMARY RECORDS OF SUPPLY WELLS AND TEST WELLS IN THE POST HEADQUARTERS AREA, WHITE SANDS MISSILE RANGE, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
James B. Cooper
U S Geological Survey Open-file report, July 1970. 202 p, 87 fig, 74 tab, 9 ref.

Descriptors: *Groundwater, *Water resources development, *Surveys, *New Mexico, Water wells, Aquifers, Alluvium, Water levels, Water quality, Water yield, Sampling.
Identifiers: White Sands Missile Range (N Mex).

Data that have been collected from the drilling, construction, testing, water sampling, and water-level measurement of all supply and test wells in the Post Headquarters area, White Sands, Missile Range, are summarized. The area of the Post Headquarters is in a reentrant between the Organ Mountains on the south and west and the San Augustin and San Andres Mountains on the north; it merges with the Tularosa Basin on the east. The total relief of the area is nearly 5,000 feet. The reentrant is underlain by unconsolidated or semiconsolidated bolson deposits consisting of alternating layers of clay and sand and some gravel. The thickness of the bolson deposits has not been well established by test drilling; however, geophysical exploration indicate that it ranges from 250 feet near the mountains to 4,000 feet along the eastern edge of the reentrant. Farther to the east in the basin proper, bolson deposits exceed 6,000 feet in thickness. The depth to water ranges from about 50 to more than 400 feet. The chemical quality of water within the reentrant is good. The shallow water farther east in the Tualrosa Basin is highly saline. Summary records of supply wells, diagrams showing the construction and lithology of individual supply wells, chemical analyses of water samples collected from the supply wells, graphs showing the annual pumpage from each supply well, and hydrographs of the supply wells are tabulated. Summary records of test wells, diagrams showing the construction and lithology of individual tests wells, chemical analyses of water samples collected from the test wells, and hydrographs of the test wells are also presented. (Knapp-USGS)

ANALYSIS OF A RECONNAISSANCE GRAVITY SURVEY FOR DRIFT-FILLED VALLEYS IN THE MERCER QUADRANGLE, PENNSYLVANIA,
Naval Oceanographic Office, Washington, D.C. Magnetics Div.; and Pennsylvania State Univ., University Park. Dept. of Geology and Geophysics.
William E. Rankin, and Peter M. Lavin.
Journal of Hydrology, Vol 10, No 4, p 418-435, June 1970. 18 p, 6 fig, 17 ref.

Descriptors: *Gravity studies, *Surveys, *Alluvial channels, *Aquifers, *Pennsylvania, Water resources development, Sands, Gravels, Glacial drift, Seismic studies, Statistical methods, Geophysics, Analytical techniques, Hydrogeology.
Identifiers: Mercer (Penn).

The effectiveness of a standard polynomial trend removal technique and two-dimensional wavenumber biltering in isolating gravity anomalies due to buried preglacial drainage systems was evaluated for an area in northwestern Pennsylvania. It was found that gravity surveying is a useful reconnaissance technique in this area. Both analytical methods isolated anomalies due to valleys of major hydrological interest, provided similar useful information on the valley trends, and gave reasonably accurate width estimates. Accurate depth estimates could not be inferred, although large anomalies generally coincided with thicker drift accumulations. With the station spacing used (about 0.75 miles), valleys sought must have drift accumulations in excess of 75 feet and widths of at least one mile if they are to be adequately resolved. The two-dimensional filtering method seems to offer the most complete information, while still being practical, and it avoids many of the problems of the polynomial method. (Knapp-USGS)

A GLOSSARY OF KARST TERMINOLOGY,
Geological Survey, Washington, D.C.
Watson H. Monroe.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C. 20402 - Price $0.25. U S Geological Survey Water-Supply Paper 1899-K, 1970. 26 p, 11 ref.

Descriptors: *Karst, *Geomorphology, Groundwater movement, Hydrogeology, Publications, Technical writing.
Identifiers: Glossary (Karst terminology).

This glossary includes most terms used in describing karst geomorphologic features and processes. The terms are primarily those used in the literature of English-speaking countries, but a few of the more common terms in French, German, and Spanish are included, with references to the corresponding English terms where they are available. The glossary also includes simple definitions of the more common rocks and minerals found in karst terrain, common terms of hydrology, and a number of the descriptive terms used by speleologists. The glossary does not include definitions of most biospeleological terms, geologic structure terms, varieties of carbonate rock that require microscopic techniques for identification, or names describing tools and techniques of cave exploration. HYDROGEOLOGICAL MAPS OF KOREA - VOL 1, ANSEONG RIVER BASIN, (KOREAN),
Geological Survey of Korea, Seoul.
Jeong Ung Lim, and Chang Ju Cho.
Geological Survey of Korea Hydrogeological Maps, Vol 1, 1969. 48 p, 22 fig, 15 tab, 5 photo, 16 ref.

Descriptors: *Hydrogeology, *Surveys, *Water resources development, Aquifers, Water yield, Alluvium, Water wells, Transmissivity, Permeability.
Identifiers: Korea, Anseong River basin.

esults are presented of hydrogeological studies in ne Anseong River basin in the central part of the orean peninsula. The geology of the area mainly onsists of biotite granite, gneiss and mica schist. ufficient groundwater can be developed from edrock only from the highly weathered zone and om alluvium. The thickness of the alluvial eposits range up to about 9 meters at the vicinity f Anseong town and 12 meters at the Pyeongtaek rea. In order to determine the hydraulic constants n this basin, more than 20 aquifer tests were caried out. The most favorable area of the basin is the nner part of the Pyeongtaek plain. The coefficients f transmissibility are 0.8 to 3.0 sq m/min, and the afe yields are more than 500 cu m perday for every umping well. The possible total amounts of the roundwater developed could be more than 30,000 cu m per day in years of average annual recipitation and at least 1,100,000 cu m per day in he irrigational season. STUDY ON SALT WATER INTRUSION INTO GROUNDWATER - PART 1. GEOHYDROLOGIC CONDITIONS OF LAVA AQUIFER (JAPANESE),
Industrial Science and Technology Agency, Kawasaki (Japan). Geological Survey.
Toshio Murashita, and Kazuo Kishi.
Bulletin of Geological Survey of Japan, Vol 18, No 6, p 1 (379)-14 (392), June 1967. 14 p, 10 fig, 5 ref.

Descriptors: *Saline water intrusion, *Aquifers, Groundwater movement, Pumping, Withdrawal, Artesian wells, Lava, Sands, Fissures (Geology), Transmissivity.
Identifiers: Japan, Fuji.

In many coastal areas of Japan aquifers have been contaminated with salt water because the seaward flow of groundwater has decreased. The greatest salt-water contamination is in the coastal area along Suruga bay. The contamination first began in the vicinity of Tago-no-ura in 1960, and next on the reaches of Numa River in 1965. The contaminated area in 1966 is ten square kilometers in total. The pumping artesian aquifer is the Fuji lava beds, which has many fissures and caves, and is very permeable. Evidence of the industrial well field indicates that the interface between the fresh water and salt water receded because rainfall was heavy and new wells were no longer developed in 1966. Contamination continues on the reaches of Numa River, because the pumpage continues to increase. (See also W70-09733). (Knapp-USGS)

ESTIMATING THE TRITIUM INPUT TO GROUNDWATER FROM WINE SAMPLES: GROUNDWATER AND DIRECT RUN-OFF CONTRIBUTION TO CENTRAL EUROPEAN SUFACE WATERS,
Heidelberg Univ. (West Germany). Physikalis ches Institut.
W. Roether.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/7, p 73-91, 1967. 19 p, 7 fig, 3 tab, 21 ref.

Descriptors: *Fallout, *Tritium, *Sampling, *Fruit crops, Groundwater, Surface waters, Rainfall, Soil water, Crops, Soil-water-plant relationships, Tracers, Tracking techniques.
Identifiers: German Federal Republic, Wines, Grapes, Vineyards.

A model is derived which allows a quantitative evaluation of wine tritium data. The tritium content of a wine sample is not determined exclusively by water taken up by the roots, but is also influenced to a large extent by direct exchange with atmospheric moisture. The soil-water fraction amounts normally to not more than 40%. Thus, wine is a sample partly of atmospheric moisture at ground level, partly of soil moisture, integrated over a period around three weeks before vintage. The tritium content of two sets of wine samples originating from two selected sites in the Federal Republic of Germany and dating back to 1949 is reported. For the period before 1955 the tritium activity of the annual groundwater recharge, including pre-thermonuclear recharge in Central Europe, is estimated from the wine data. Descriptors: *Radioactive dating, *Groundwater, *Tritium, *Carbon radioisotopes, Fallout, Groundwater movement, Recharge, Ion exchange, Adsorption, Water chemistry, Mixing, Diffusion.
Identifiers: Germany, Rhine River.

Shallow groundwater can be dated with some accuracy on the basis of its bomb tritium content if the unsaturated soil cover and the aquifer itself are sufficiently homogeneous. A few examples from the Rhine valley are presented. The decrease in tritium level from the water table to a few meters below is nearly two orders of magnitude. Agreement between the measured or estimated variation of bomb tritium in rain during the past decade and the tritium found in shallow groundwater can be obtained if one takes into account that (a) practically no rain reaches the water table, and (b) water is mixed by diffusion. Both effects can also be observed in the soil moisture of the unsaturated soil above the water table. Carbon-14 increase in groundwater due to bombs is delayed compared to tritium, the reasons being delay in the biological system and exchange with the carbonate in the soil. A simple model is presented, which allows the evaluation of the influence of exchange on the C-14 age obtained. The deviation from the true age depends on the ratio of the carbonate content in the aquifer material to the carbonate content of the water, on the specific contact surface or the grain size, but not on the groundwater velocity. (See also W70-09868) (Knapp-USGS)

MODEL EXPERIMENTS FOR C-14 WATER-AGE DETERMINATIONS,
Bundesanstalt fuer Bodenforschung, Hanover (West Germany).
I. Wendt, W. Stahl, M. Geyh, and F. Fauth.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/22, p 321-337, 1967. 17 p, 11 fig, 4 tab, 6 ref.

Descriptors: *Radioactive dating, *Groundwater, *Carbon radioisotopes, Calibrations, Ion exchange, Fallout, Mixing, Water chemistry, Carbonates, Carbon dioxide, Model studies, Laboratory tests.
Identifiers: Germany, Groundwater dating.

The C-14 age of water samples is calculated by assuming that fossil carbonate is dissolved by biogenic CO2. To investigate the mechanism of the dissolution, laboratory experiments were carried out under controlled conditions. Non-radioactive CaCO3 and radioactive CO2 were used to check the validity of theoretical assumptions regarding the average C-14 activity and the C-13 value of the total carbon which is dissolved as CO2 and HCO3. Exchange between the undissolved carbon present in the CaCO3 and that present in the HCO3 was also studied. In the simple CaCO3-CO2 system the assumption of no exchange is not justified even for a constant water temperature. Correction for the initial C-14 activity by means of the C-13 value is not consistent, and the reliability of the C-14 dating method is questionable. (See also W70-09868) (Knapp-USGS)

SURFACE-WATER INFILTRATION AND GROUNDWATER MOVEMENT IN ARID ZONES OF VENEZUELA,
Instituto Venezolano de Investigaciones Cientificas, Caracas.
M. A. Tamers.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/23, p 339-353, 1967. 15 p, 5 fig, 1 tab, 20 ref.

Descriptors: *Groundwater movement, *Radioactive dating, *Deserts, *Carbon radioisotopes, Carbonates, Water chemistry, Leaching, Ion exchange, Fallout, Stable isotopes, Aquifers, Limestones, Infiltration, Mixing, Evaporation.
Identifiers: Venezuela.

Radiocarbon dating of the carbonate species present in groundwater is capable of furnishing information on the recharge of underground deposits as well as directions and rates of movement. The origins of the dissolved carbonates fall under two classifications: modern carbon is provided by carbon dioxide from the atmosphere and the products of plants in the soil, and ancient carbon comes from dissolving limestone. The latter source is essentially free of radiocarbon and, therefore, causes falsely old dates for the total groundwater carbonates. An estimate of the amount of limestone dilution is the main difficulty connected with radiocarbon dating of groundwater. The methods proposed for this correction were applied to several aquifers under different conditions. Aquifers of Barquisimeto, Maracaibo, Coro, Paraguana, and Valencia in Venezuela were investigated by the method of natural radiocarbon. Ages ranging from modern to 35,000 yr were obtained. In general, the older dates correlate well with arid climatic conditions. However, deep wells providing modern water have been observed in virtual deserts, but these are explained by the recharge of irrigation water previously extracted from the ground. EFFECT OF MEMBRANE PORE SIZE ON THE MEASUREMENT OF WATER TENSION IN BENTONITE SUSPENSIONS,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
Amos Banin, Brian G. Davey, and Philip F. Low.
Soil Science of America Proceedings, Vol 32, No 2, p 306-309, May-June 1968. 4 p, 5 fig, 9 ref.

Descriptors: *Membrane processes, *Porosity, *Clay minerals, *Moisture tension, *Osmosis, Osmotic pressure, Turbidity, Colloids, Tensiometers.
Identifiers: Clay-water systems.

A pressure-transducer tensiometer and a dynamic osmometer were used to measure water tensions and osmotic pressures in clay-water systems. The two methods of measurement produced the same results. Different membranes, having pore sizes ranging from 0.004 to 0.8 microns were used with the tensiometer. Measured water tension of a given system depended on the pore size of the membrane; as the pore size increased, the tension decreased. However, little or no turbidity appears in a solution when it is separated from a clay suspension by a membrane having pores this small; therefore, the relationship between pore size and tension was not due to differences in membrane permeability to the clay particles. Nor was it due to differences in membrane permeability to dissolved solutes. No lasting tension developed when a NaCl solution or an extract of the clay were utilized in place of the clay suspensions. Two possible explanations were proposed: (1) entrance of particles into the pores was all that was required to lower the reflection coefficient, and (2) the gelation of the clay suspensions within the pores produced gels having particle densities and arrangements and, hence, permeabilities to dissolved solutes, that were dependent on the dimensions of these pores. (Knapp-USGS)

ENERGY RELATIONS IN WATER TRANSPORT AND SUPPLY OF WATER BY CAPILLARY RISE,
Agrophysical Inst., Leningrad (USSR).
N. Bondarenko, and S. Nerpin.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 527-535, 1968. 9 p, 6 fig, 10 ref.

Descriptors: *Soil water movement, *Water properties, *Viscosity, *Plasticity, *Yield strength, Rheology, Flow, Porous media, Unsaturated flow, Darcys law, Hydrogen bonding, Laboratory tests, Hydraulic gradient, Hydraulic conductivity.
Identifiers: Bingham bodies, Visco-plastic properties.

It is shown that water, including pure water, is not an exact Newtonian liquid and should be characterized as a Bingham body by two coefficients: plastic viscosity, and yield stress of order 0.01 dyne/sq cm. The yield stress of pure water may be caused by the formation of quasi-crystalline molecular frames due to hydrogen bonds. Taking into account the full rheological characteristics of water, it is possible to explain the deviation of water flow in porous media from Darcy's law (in the case of full saturation) and from the analogous relation for unsaturated soils. The influence of visco-plastic properties of water on equilibrium and transfer of water in unsaturated zone is shown. The data obtained give a rigorous physical base to predict and control soil moisture content. (See also W70-09569) (Knapp-USGS)

DEVELOPMENT OF EQUATIONS DESCRIBING TRANSPORT OF MASS, MOMENTUM AND ENERGY IN SOILS,
Agricultural Research Service, Madison, Wis.; and Illinois Univ., Urbana.
P. A. C. Raats, and A. Klute.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 535-546, 1968. 12 p, 23 ref.

Descriptors: *Soil water movement, *Mass transfer, *Energy transfer, *Momentum transfer, Soils, Thermodynamics, Flow, Porous media, Entropy, Physicochemical properties, Energy budget, Heat balance, Continuity equation.
Identifiers: Soil transport equations, Multiphase flow, Mixtures, Continuum theory.

A theory of mixtures is used as a basis for the construction of a macroscopic, comprehensive theory for transport of mass, momentum, and energy in soils. An unsaturated soil is regarded as a mixture of a solid phase, an aqueous phase, and a gaseous phase. Balances of mass, momentum, and energy are written for the phases. The necessary and sufficient assumptions for the force balance of the aqueous phase to reduce to Darcy's law are stated. From the balance of energy and the Gibb's equation, a balance of entropy is derived. It is pointed out that there are indications that the foundations of thermodynamics of irreversible processes are not as evident and as clear as one is often led to believe. (See also W70-09570) (Knapp-USGS)
W70-09569

EFFECT OF COMPACTNESS AND INITIAL MOISTURE CONTENT OF THE SOIL ON THE PROCESS OF CAPILLARY RISE,
Technical Univ. of Building and Transport Engineering, Budapest (Hungary). Dept. of Water Resources Development.
I. Ijjas.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 547-559, 1968. 13 p, 9 fig.

Descriptors: *Capillary action, *Soil water movement, *Soil structure, Moisture content, Capillary conductivity, Mathematical studies, Soil compaction, Soil density, Soil horizons, Soil moisture, Soil moisture meters, Tracers.
Identifiers: Initial moisture content.

The effect of compactness and initial (natural) moisture content of the soil on the process of capillary rise and on capillary transmissivity is discussed. The analog between deviations of capillary characteristics in soils of identical grain size distribution, but with different compactness and initial moisture

ntent, and those in soils of different grading is ex-
nined. A comparison is made between capillary
ocesses taking place in soils composed of two
ers. Characteristics of capillary flow directed
wards and enclosing an angle between 0 and 90
g with the horizontal are also studied. (See also
70-09571) (Knapp-USGS)

EADY FLOW IN THE ZONE OF AERATION,
blogical Survey, Denver, Colo.; and Geological
vey, Little Rock, Ark.
W. Stallman, and J. E. Reed.
nch resume. In: Water in the Unsaturated Zone,
II, Proceedings of the Wageningen Symposium,
Netherlands, June 19-25, 1966, International
ociation of Scientific Hydrology, Publication
83, p 565-578, 1968. 14 p, 4 fig, 2 tab, 13 ref.

scriptors: *Hydraulic conductivity, *Capillary
ductivity, *Soil water movement, *Zone of
ation, Darcys law, Hydraulic gradient, Porosity,
aturated flow, Groundwater movement, Steady
, Recharge, Infilitration.
ntifiers: Soil water discharge.

draulic conductivity in the steady upward flow
ne zone of aeration can be estimated using data
the porosity and the thickness of the hydrauli-
y conductive zone above the water table. For
nward flow hydraulic conductivity is estimated
g the liquid pressure-head measured far above
water table. It seems unlikely that vertical
city in the zone of aeration can be estimated
in two orders of magnitude by use of Darcy's
with field observations of the head distribution
laboratory measurement of conductivity.
phasis in research is needed on the following:
Field applications of theories of multifluid flow;
Field measurement of velocity in the zone of
tion; (3) Listing in reports of laboratory ex-
ments all pertinent data on porous media and
ids used; (4) The relation between plant growth
ors and depth to the water table. (See also

**TER TRANSMISSION BY EVAPORATION
D FROST ACTION AT DIFFERENT SOIL
NDITIONS IN SUCTION LYSIMETERS,**
Czeratzki.
ich resume. In: Water in the Unsaturated Zone,
II, Proceedings of the Wageningen Symposium,
Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 579-591, 1968. 13 p, 11 fig, 3 tab, 15 ref.

Descriptors: *Soil water movement, *Lysimeters, *Instrumentation, Evapotranspiration, Evaporation, Moisture tension, Moisture content, Pore pressure, Water balance, Hydrologic budget.
Identifiers: *Deep lysimeters.

Various methods used for investigating water transmission in soils in connection with problems of water recharge, evaporation and evapotranspiration are reviewed. The construction of lysimeters must be such that their water transmitting properties are similar to those occurring under natural conditions. One of the greatest difficulties in lysimeters with no water table is the establishment of water outflow under suction conditions as in a continuous soil profile. With a percolation funnel the capillary system ends at the bottom of the soil monolith so that the outflow of the percolation water takes place with zero suction. Establishment of suction conditions at least in the upper part of the root zone is possible with deep lysimeters. In shallow lysimeters the impeded water outflow leads to overmoistening of the soil monolith and consequently to unnatural conditions of water transfer. This difficulty can be eliminated by using suction lysimeters with bottoms consisting of a suction device for maintaining variable water suction. The results of tests of suction lysimeters are compared with the work of other authors and the possibilities created by this type of lysimeter for the investigation of soil-water-plant-relations are described. BASIN PEAT CULTURE FOR WATER ECONOMY,
Helsinki Univ. (Finland). Dept. of Agricultural Chemistry.
V. Puustjarvi.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 591-595, 1968. 5 p, 3 tab.

Descriptors: *Evaporation control, *Peat, Marshes, Mulching, Groundwater movement, Soil water movement, Evaporation, Water utilization, Soil management, Water conservation.
Identifiers: *Peat culture, Finland.

In recent years the Agricultural Chemistry Institute of Helsinki University has been attempting to develop a water saving peat culture method. The method is called peat basin culture. The surface of the soil is covered by a polyethylene film and the edges of the film are turned up to a height of 3-5 cm. Fertilized peat is placed in the basin so formed and is then soaked thoroughly with water. A water layer of 3-5 can remain at the bottom of the basin to assure an even supply of moisture to the plants. Groundwater is not necessary and it is not used when the peat layer is thin. The evaporation can be decreased further by covering the peat layer with a polyethylene film or by using plastic greenhouses. The quality of the peat used in basin culture must be suitable for this purpose. To remain in equilibrium with the groundwater the air volume of the peat must be at least 20%. The capillary rise of the water from the groundwater to the surface of the peat layer must be rapid and even. The advantages of the method: (1) There is no unnecessary loss of water or there is no leaching; (2) Pathogens cannot spread from the soil to the culture medium; (3) Growth is rapid and even; (4) It is a simple and easy method to master. EVAPORATION FROM BARE SOIL AND THE WAYS OF REDUCING IT,
Agrophysical Inst., Leningrad (USSR).
S. Nerpin, S. Pakshina, and N. Bondarenko.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 595-602, 1968. 8 p, 7 fig, 16 ref.

Descriptors: *Evaporation, *Soil water movement, *Evaporation control, *Mulching, Capillary action, Capillary conductivity, Diffusion, Soil conservation, Water conservation, Soil management, Hydrogen bonding, Water utilization.
Identifiers: *Capillary conductivity reduction.

Evaporation from bare soil is an unproductive process in arid and semiarid regions. It not only reduces the soil moisture content, but also results in salt accumulation in the root zone. A liquid evaporation mechanism is proposed to take into account both diffusive and film water flow, and explains the apparent deviation from Thompson's law and controlling evaporation intensity as well. Some surface active substances when applied to the surface soil layer bring about a reduction in evaporation intensity not only because they interrupt the film flow on the capillary surface, but also because they reduce the diffusive and thermo-capillary flow. The effect of non-ionic surfactants which strongly protect the soil surface from evaporation depends on the intensity of the bonds between surfactants and the soil particles. A temperature increase results in progressive transfer of surfactant molecules from the surface of the particles to bulk. In such a case protection is decreased, and at a critical of temperature, hydrogen bonds are broken and all protection is lost. The laboratory data presented confirm this conception. The critical temperature for investigated surfactants is about 60 deg C. (See also W70-09576) (Knapp-USGS)

RELATION BETWEEN EVAPORATION AND SOIL HYDROCONSTANTS,
Ceskoslovenska Akademie Ved, Bratislava. Inst. of Hydrology and Hydraulics.
Jan Benetin, and Julia Cervenkova.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 602-610, 1968. 9 p, 5 fig, 2 tab, 5 ref.

Descriptors: *Evaporation, *Soil water movement, *Soil physical properties, Capillary action, Saline soils, Saline water systems, Saline water, Salts, Moisture content, Diffusion, Drying.
Identifiers: Soil salinization.

Evaporation as a cause of the soil salinization process is proportional to the difference between the vapor tension of the soil air and that of the surrounding atmospheric air. As the soil vapor tension is dependent upon the soil moisture content, the affinity to liquid water to the solid soil phase affects the course of soil water evaporation. A method is given for estimating the soil water limits from the recorded course of soil sample drying. Results from experiments carried out with various soils show that the intensity of evaporation is still considerable at the low soil moisture contents and it depends remarkably upon the chemical composition of the soil. Soils saturated with K- and Na-ions evaporate more rapidly at low water contents than soils saturated with Ca-ions. The differences in evaporation decrease with increase in soil water content. Slow drying of saline soils is not due to the chemical composition of the soils, but to the small water flow moving into the surface layer. (See also W70-09577) (Knapp-USGS)
W70-09576

THE MOVEMENTS OF DIFFERENT SALT SOLUTIONS IN SOIL PROFILES,
Magyar Tudomanyos Akademia Talajtani es Agrokemiai Jutato Intezete, Budapest.
I. Szabolcs, and J. Lesztak.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium,

The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 611-621, 1968. 11 p, 6 fig, 2 tab, 11 ref.

Descriptors: *Soil water movement, *Saline water systems, *Soil structure, *Permeability, Evaporation, Soil physical properties, Soil chemical properties, Soil chemistry, Water chemistry.
Identifiers: Soil salinity-permeability relations.

Experiments were made to study the laws of capillary movement of salt solutions of different composition in soil profiles. Fore the experimental purposes 1 meter high plastic tubes, 12 cm in diameter, were filled with a chernozem soil. Using capillary wetting from the bottom, the soils were treated with 0.1 N solutions of Na, Na2 and Mg sulfate, chloride, and carbonate. In the case of capillary wetting from the bottom, the solutions' movement was significant only if free evaporation was assured. In the absence of evaporation only the lowest, about 15 cm thick soil layer came into contact with the salt solutions. No significant differences could be observed between the effects of the various salts. When the capillary movement was aided by evaporation, the movements of the various salt solutions within the soil column differed to a great extent from each other. While the solutions of Mg chloride and neutral sodium salts reached the surface of the 1 meter high soil column, the soda solution penetrated only the lowest, 15 cm thick layer. The influence of the soda solution intensely manifested itself by significantly changing the physical properites of this layer. As a result treating the soils with soda solution, the microaggregate compositon of the soil layer involved changed, the water permeability of that soil layer was practically reduced to zero, the structure factor decreased, while the dispersity increased and, as compared to the soils treated only with the solutions of neutral sodium salts, the plasticity also increased. If sodium salts capable of alkaline hydrolysis, especially soda, can be found in the soil, they exert a significant and detrimental influence on the water and salt movement which take place in the soil and on the soil's physical and water regime properties. ON THE PROBLEM OF SALT DIFFUSION IN THE ZONE OF AERATION,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
N. A. Ogilvy.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 622-628, 1968. 7 p, 8 ref.

Descriptors: *Saline water systems, *Soil water movement, *Diffusion, Mathematical studies, Equations, Diffusivity, Capillary action, Infiltration, Arid lands, Discharge (Water), Permeability, Soil properties, Convection.
Identifiers: Soil salt movement.

With small amounts of infiltration which are generally observed in arid regions in the zone of aeration an ascending salt flow counteracts a descending convection salt transfer by infiltrating water. At distance from the solid walls of the rock skeleton exceeding the mean free path of translation of particles, diffusion in free interstitial water is similar to that in large solution volumes. In bound water, translation jumps of the particles occur with different frequency. Therefore, the diffusion coefficient in bound water may greatly differ from the corresponding free water coefficient. In rocks, the solute transfer in bound water is proportional to the rock's specific surface and the thickness of the bound water film. In sands, the solutes are mainly transferred in free water, while in clays they move primarily within the bound water. The diffusion phenomena in the zone of aeration of arid regions account for the processes of carbonate cementation of this zone, for the appearance of gypsum crusts in it and also for the observed relations between occurrence of ombrophytes and the groundwater salinity. EFFECT OF SOIL SALINITY ON THE LOSS OF WATER FROM VEGETATED AND FALLOW SOIL,
Geological Survey, Phoenix, Ariz.
T. E. A. van Hylckama.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 635-644, 1968. 10 p, 4 fig, 4 tab, 18 ref.

Descriptors: *Evapotranspiration, *Saline water, *Phreatophytes, *Tamarisk, *Arizona, Lysimeters, Consumptive use, On-site tests, Arid lands, Water levels, Water management (Applied), Water conservation.
Identifiers: Evapotranspirimeters.

In the semiarid zone of the southwestern United States some six million hectares near washes and along rivers are covered by a dense growth of riparian or phreatophytic vegetation, consisting very often of pure stands of saltcedar (Tamarix pentandra). This vegetation, having a nearly unlimited access to water, transpires large quantities, estimated to total over 29,000 million cu km per year. In order to measure the actual rate of evapotranspiration 6 large evapotranspirometers (surface area about 80 sq m) were installed near Buckeye, Arizona in 1959 and another 5 in 1962. In 1963 the salinity of the groundwater in the older tanks had risen from an original 4 to over 200 parts per thousand. Although saltcedar is reported to tolerate and thrive on soil moisture of high salinity, the tanks were flushed out until the salinity of the effluent was back to the original. Whereas in 1963 the water use varied between 80 and 200 cu m per tank per year (depending on depth to water in the tanks), after flushing, the use increased by more than 50%. It is frequently assumed, when water use by phreatophytes is estimated, that the plants have access to water of low salinity. The data presented show that this assumption may not always be right and that the actual water losses may be less than estimated by as much as 40%. (See also W70-09580) (Knapp-USGS)

VERTICAL DISTRIBUTION OF EXCHANGEABLE CATIONS IN SOILS OF ARID ZONES AS AN INDICATION TO THE DEPTH OF WATER INFILTRATION,
Egyptian Desert Inst., Cairo.
Ahmad Amin Hassan.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 650-658. 9 p, 4 fig, 2 tab, 9 ref.

Descriptors: *Soil water movement, *Leaching, *Cation exchange, *Soil chemistry, *New Mexico, Water chemistry, Solutes, Aqueous solutions, Ion exchange, Infiltration, Arid lands, Evaporation, Chemical precipitation, Saline soils.
Identifiers: Socorro (N M).

The climate, physiography, geology, and soils of the Socorro area, New Mexico are described, and the distribution of exchangeable cations in the soils is discussed. Soil samples were collected from 75 profiles and ammonium acetate was used to extract exchangeable cations. The amount of exchangeable calcium and magnesium ions tends generally to decrease until the lower B or C horizons are reached; then there is usually an increase in the amount of these ions. The amount of exchangeable sodium ion generally increases with depth until the lower B or C horizons, then it decreases. Potassium showed a random distribution in most of the soils. The abrupt change in distribution of these exchangeable cations coincides with the lime accumulation zone of the soil. Exchange distribution indices for soils show that much of the exchangeable Ca, Mg, and Na moving downward through the soil were retained by the B and the C horizon. It was assumed that the soil profile has been developed from a relatively uniform material. From the exchange distribution indices, it may be justified to conclude that little infiltration of water or none in the lower layers of these soils take place. A negligible penetration of water into the soil, followed by evaporation of the moisture back into the atmosphere, prevents the possibility of through leaching of the surface soil. E OF SOIL MOISTURE AND GROUND- ATER BY COTTON PLANTS UNDER SPRIN- LING IRRIGATION IN ARID ZONES,
l-Union Scientific Research Inst. of drotechnics and Reclamation, Moscow (USSR).
V. Preobrazhenskaya.
nch resume. In: Water in the Unsaturated Zone, l II, Proceedings of the Wageningen Symposium, e Netherlands, June 19-25, 1966, International sociation of Scientific Hydrology, Publication 83, p 688-693, 1968. 6 p, 3 fig, 4 tab, 5 ref.

scriptors: *Consumptive use, *Irrigation water, otton, Arid lands, Lysimeters, Evapotranspira- n, Leaching, Sprinkler irrigation, Irrigation prac- es, Water conservation, Water management pplied).
ntifiers: Cotton irrigation.

rinkling irrigation of cotton is useful in arid es. It is most efficient when there is a shllow undwater table--of fresh or only slightly neralized water--at the beginning of the vegeta- n period. This condition can be produced by au- n-winter waterings, designed to produce such rage and also to flush saline patches of the soil. ld tests, using lysimeters 4 m deep showed that r 3000 or 3500 cu m/ha of winter irrigation for harge and flushing, the water table came up to ut 1.3 or 1.5 m: sprinkling irrigation in the mmer, using 1500 to 2000 cu m/ha in 3 or 4 terings then produced high cotton yields (30 to centners per ha), and the water table sank to 3.5 4.0 m. The total water consumption with this hnique was 6500 to 7500 cu m/ha, somewhat ller than when the cotton was irrigated only in growing season by furrow irrigation, but the sfaction of part of the water need by autumn or ter application releases considerable resources water for irrigation of additional areas in mmer time. TER MOVEMENT AND ITS UTILIZATION PLANTS UNDER THE DEEP WATER DRAGE IN SOIL BY USING OFF-SEASON RIGATION,
-Union Scientific and Research Inst. of drotechnics and Reclamation, Moscow (USSR).
G. Grammaticati.
nch resume. In: Water in the Unsaturated Zone, II, Proceedings of the Wageningen Symposium, Netherlands, June 19-25, 1966, International ociation of Scientific Hydrology, Publication 83, p 694-704, 1968. 11 p, 4 fig, 7 tab, 4 ref.

criptors: *Soil-water-plant relationships, *Soil sture, *Soil water movement, *Evapotranspiration, Drying, Evaporation, Consumptive use, Irrigation water, Water conservation, Irrigation practices.
Identifiers: Deep soil water storage.

To determine the water uptake by roots from the deep soil layers, the root penetration and soil moisture movement within and beyond the root zone and on the plots without plants were studied. The depth of root penetration of most field crops was more than 1 metre, and that of sunflower and winter wheat reached 270-300 cm when the soil was deeply irrigated. A few plant roots penetrate into the deep soil layers. However, intense growth and high physiological activity of the roots make it possible for the plants to utilize a great amount of moisture from the deep soil layers. Physiological activity of the root system in the deep soil layers consists not only of moisture uptake from the soil, but also of water transfer to the upper tier which is located in dry soils. Evaporation from bare soil is intense in the upper soil layers, gradually decreases with depth, and finally dies away at a depth of 70 to 80 cm. Therefore, in deeper soil layers the process of biological desiccation takes place if the roots penetrate into these layers. The zone of 'the principal biological desiccation' lies deeper, and its depth depends on the root penetration and may reach to 280 or 300 cm. The uptake from the zone of the principal biological desiccation reaches 1600 cubic metre per ha, equal to 45% of consumptive use during the whole vegetative season. The stable harvest obtained by using deep off-season irrigation may be explained by the presence of water in the principal biological zone where there is no loss of water by evaporation, but where stored water serves as a reserve to protect the plants from drought. WATER REGIME OF THE SOIL AS AFFECTED BY VEGETATION,
Research Inst. of Agricultural Economics, Budapest (Hungary).
K. Kallay.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 704-711, 1968. 8 p, 4 tab, 10 ref.

Descriptors: *Soil-water-plant relationships, *Soil moisture, *Evaporation, *Evapotranspiration, Water storage, Soil water movement, Consumptive use, Seepage, Heat budget, Water balance.
Identifiers: Hungary, Soil water-groundwater relationships.

The effect of winter wheat, maize and lucerne on the water regime of the soil in the semiarid climate of central and eastern Hungary, on deep soil with groundwater level below 300 cm was studied. During three winters, on average, 72% of the precipitation was stored in deeply loosened, uncropped soil, 66% under winter wheat, 55% under lucerne, and 26% under natural grassland. During the vegetation period, foliage retains part of the precipitation, lucerne retained 2-4 mm precipitation, but immediately after the harvest of hay only 1 mm was retained. In August 1938, 220 mm of precipitation wetted well cultivated wheat stubble to a depth of 60-70 cm, while under both maize and sugar beet the depth was 30 cm, and under lucerne, only 20 cm. Transpiration during the phase of rapid development of thirty to forty days, represents 70-85% of the annual absolute water consumption. In this critical period the moisture reserve previously stored by the soil may be exhausted, and damage by drought may occur. The losses from the water reserve are increased by evaporation from the soil. Measurements of the absolute water consumption of several wheat varieties, and of lucerne, were made. The absolute quantity of water transpired on soils of good and poor nutritional status, with great differences in crop yields, was the same. On the basis of these investigations conducted in Hungary some measure to be taken in this field to obtain higher crop yields are suggested. (See also W70-09587) (Knapp-USGS)

POTENTIAL EVAPOTRANSPIRATION OF MAIZE (FRENCH),
Institute of Irrigation Research, Prague (Czechoslovakia).
Miloslav Pycha.
In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 711-723, 1968. 13 p, 2 fig, 9 tab, 9 ref.

Descriptors: *Soil-water-plant relationships, *Supplemental irrigation, *Corn (Field), Water balance, Evapotranspiration, Humidity, Consumptive use, Frequency analysis, Demonstration watershed, Experimental farms.
Identifiers: Czechoslovakia, Corn irrigation.

With accurate data more economical supplemental irrigation systems can be designed. One of the required data is the water consumption of various crops. Investigations concerning the consumption of maize started in Czechoslovakia in 1955. Consumption was determined under natural conditions from water balance studies. Optimum conditions of water supply were obtained by irrigation. Consumption was calculated weekly, using soil moisture determinations at a depth of 100 cm. A correlation between the yearly consumption and the saturation deficit of the air was determined. The course of consumption during growth was characterized by a biological curve for different stages of growth. The coefficients of this curve were determined from the weekly data obtained with the water balance and the sum of daily values of the saturation deficit during the period under consideration. These data were used to calculate the water consumption of maize during the period from 1932-1962. The results were used in a frequency analysis for the determination of water consumption of maize. THE EXTRACTION OF SOIL MOISTURE BY PLANTS UNDER DRY LIMIT CONDITIONS,
Hessiches Landesamt fuer Bodenforschung, Wiesbaden (West Germany).
O. Klausing.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 724-729, 1968. 6 p, 1 tab, 10 ref.

Descriptors: *Soil-water-plant relationships, *Drought resistance, Crop response, Potatoes, Moisture stress, Moisture content, Evapotranspiration, Physiological ecology, Plant physiology, Drought tolerance, Moisture deficit, Water shortage, Capillary water.
Identifiers: Germany.

During a dry summer period in Germany, potato plants extracted water from soil beyond 15 atm. suction. These measurements were followed by laboratory studies on soil moisture and plant growth under limiting conditions of incipient drying and permanent wilting. The result is a new thermodynamic treatment of soil moisture in respect of capillary water and film water, and their importance for specifying availability. The term 'available water' has to be defined with the same thermodynamic differentiation on the basis of plant water relations studies in laboratory and in the field. These ecophysiological investigations suggest that the constitutional drought resistance of the higher plants is conditioned by relative independence of capillary forces and osmotic forces in the cellular plant tissue and in the whole plant body. Therefore the plant constitution (especially its drought resistance) has to be considered in all questions about the extraction of soil moisture by plants under dry limit conditions. EVAPOTRANSPIRATION OF PLANTS AND FLUCTUATION OF THE GROUNDWATER TABLE,
State Inst. of Hydrology and Meteorology, Warsaw (Poland). Water Physics Div.
Jerzy Jaworski.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 730-739, 1968. 10 p, 10 fig, 1 tab, 17 ref.

Descriptors: *Soil-water-plant relationships, *Drought resistance, *Capillary water, Moisture tension, Phreatophytes, Crop response, Moisture content, Evapotranspiration, Plant physiology, Physiological ecology, Drought tolerance, Water shortage, Consumptive use, Water level fluctuations.
Identifiers: *Soil water-groundwater relationships, Poland.

Evapotranspiration by plants--in particular by woody plants--is quite intense in the growing period (725 mm). With a considerable precipitation deficit, the water must come from the zone of the capillary rise of soil moisture. The moisture uptake from this zone during the evapotranspiration process is reflected in short-term daily fluctuations of the groundwater level. The fluctuation range depends on the kind of vegetation, the intensity of transpiration, and whether roots are deep or shallow. The groundwater fluctuations influence the side inflow of groundwater from adjacent areas with less intense transpiration. Considerable daily losses of soil moisture by evapotranspiration in a rainless period cause a continuous decline of the average groundwater level. For each 1 mm of daily evapotranspiration from poplars there was a daytime fall of the groundwater level of about 2 cm. This daily fluctuation sometimes reached 17 cm, but under a meadow or potatoes the fluctuations were very slight, or they did not occur at all. The daily fluctuation is less intense on a cloudy day, probably because of smaller evapotranspiration intensity. Studies of the source of water for plants--in particular, for deeply rooted plants--must not be restricted to the unsaturated zone only. They may draw on groundwater. THE INFLUENCE OF VARIOUS AGRICULTURAL PRACTICES ON SOIL WATER AND IN THE ZONE OF AERATION OF CHERNOZEMS (FRENCH),
Dilko Dilkov.
In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 739-742, 1968. 4 p, 2 tab.

Descriptors: *Soil-water-plant relationships, *Chernozems, Soil water movement, Moisture content, Field capacity, Hydraulic conductivity, Consumptive use, Clays, Loess, Zone of aeration, Corn (Field), Alfalfa.
Identifiers: Bulgaria.

Investigations on soil moisture in the unsaturated zone of chernozems in the Northern part of Bulgaria showed interesting regularities due to the influence of various crops and the hydraulic conductivity of the subsoil. The depth to which the soil moisture is affected depends on the granular composition of the soil. In typical loess soils the size fraction from 0.05-0.01 mm predominated. An abrupt change in soil water movement was observed when the soil moisture content was at 65-70% of field capacity. In this region the crop also affected the hydrological situation in the unsaturated zone, with a rooting depth from 0.5 to 2.0 m to a layer in which more clayey material was present. In this layer the moisture content was about 85-90% of field capacity. Large differences in the soil moisture in the unsaturated zone were observed with the various crops. Alfalfa, grown during 5-6 years on the same spot, showed the largest effect on the recharge of the subsoil. This crop used all the water which could be taken up by the roots to a depth of 608 m. A similar result was obtained with maize, and to a much shallower depth with other crops. The various crops affected the soil moisture in the unsaturated zone and also the vertical movements. DETERMINATION OF STORAGE COEFFICIENTS FROM OBSERVATION OF GROUNDWATER LEVELS,
Institute for Land and Water Management Research, Wageningen (Netherlands).
L. F. Ernst.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 966-990, 1968. 25 p, 15 fig, 1 tab, 13 ref, append.

Descriptors: *Storage coefficient, *Groundwater movement, *Water level fluctuations, *Soil water movement, *Saturated flow, Storage capacity, Analytical techniques, Hydrogeology, Water balance, Hydrologic budget.
Identifiers: Groundwater level fluctuations.

Particular solutions of the basic differential equation for non-steady groundwater flow between parallel drainage channels show to what degree the fluctuations of the groundwater table depend on the storage coefficient. In areas with not too small spacings of the drainage channels, the fluctuations of the groundwater table can be considered with a good approximation as being directly proportional to the inflow (excess precipitation or capillary rise) through the upper boundary of the considered area and as inversely proportional to the storage coefficient. In such areas the knowledge of maximum and minimum groundwater levels (winter and summer) and of the corresponding values of excess precipitation and capillary rise is sufficient for a determination of the storage coefficient. From measurements of the relation between moisture suction and moisture content in sandy soils it is known that at the same moisture suction a smaller grain size involves a smaller air content and therefore also a smaller storage coefficient. This agrees with the variations in the groundwater level fluctuation as shown in some maps: small fluctuations in areas with coarse sandy soils, large fluctuations in areas with fine sandy soils. W. C. Visser.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 952-966, 1968. 15 p, 16 fig, 1 tab, 3 ref.

Descriptors: *Unsaturated flow, *Soil water movement, *Mathematical studies, *Analytical techniques, Hydrogeology, Water balance, Hydrologic budget, Runoff, Infiltration, Evapotranspiration, Storage capacity, Soil moisture.
Identifiers: Groundwater movement calculation, Soil water movement calculation, Graphical methods.

The changes in the depth of the groundwater table are the result of the integrated effects of rain discharge, evaporation and storage. It is possible to reconstruct the values for the quantity of discharge real evaporation and storage if rainfall and groundwater depth are given. This can be carried out along lines of fitting the data to physical formulae or along lines of graphical analyses. The graphical method is accessible to anyone without need of complicated mathematical or laboratory equipment. Methods for its use are given and discussed. TOP WATER AND INTERSOIL RUNOFF OF SNOWMELT AND RAINFALL WATER,
Hydrometeorological Research Center, Moscow (USSR).
A. I. Subbotin.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 946-951, 1968. 6 p, 1 fig, 9 ref.

Descriptors: *Soil water movement, *Saturated flow, *Subsurface runoff, Snowmelt, Rainfall, Rainfall intensity, Percolating water, Infiltration, Recharge.
Identifiers: *Top water (Saturated soil water movement).

Top water, a temporary saturated soil water zone and intersoil runoff appear as an effect of heavy rainfall and snowmelt. Top waters usually arise in podzol soil; however, in spring they can arise also in homogeneous soil (chernoziom, loess), since at this time an impermeable stratum of still frozen soil may occur under the thawed-out layer. Field and laboratory research showed the important role of top water and intersoil runoff in the aeration zone and in the runoff originating from rainfall and snowmelt. ary action, Heat transfer, Convection,
ration, Thermodynamic behavior, Soil
s, Soil chemistry, Temperature.
iers: *Thermal moisture transfer.

ist soils where temperature gradients exist,
llowing mechanisms of thermal moisture
r can be active: (1) Vapor convection; (2)
diffusion; (3) Vapor thermal slipping; (4) Thermo-capillary flow; (5) Thermo-capillary film flow; (6) Liquid transfer induced by changing volume of entrapped gas due to the change of temperature; (7) Thermo-selfdiffusion of water; (8) Thermo-osmosis of liquid; (9) Combined vapor-liquid transfer including the interaction between liquid and vapor within pores of a soil. When the soil freezes another mechanism is induced by the liquid-to-ice phase transition and by the changes in the moisture potential of the system. When investigating thermal moisture transfer it is important first of all to estimate the relative importance of vapor and liquid transient transfers because this determines the magnitude of related heat flow, the transfer of dissolved matter, and the methods of regulating thermal moisture transfer. MOVEMENT OF MOISTURE AS A LIQUID AND VAPOUR IN SOILS OF SEMI-DESERTS,
Akademiya Nauk SSSR, Moscow. Pochvennyi Institut.
M. M. Abramova.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 781-789, 1968. 9 p, 2 fig, 7 tab, 9 ref.

Descriptors: *Soil water movement, *Mass transfer, *Diffusion, *Water vapor, *Drying, Condensation, Evaporation, Water circulation, Energy gradient, Energy transfer, Solutes, Aqueous solutions.
Identifiers: Water vapor transfer, Soil water vapor, Temperature gradient.

During evaporation from wetted soil, liquid moisture moves towards the evaporating layer. As this movement proceeds there is a partial return of moisture as vapor into the deeper layers. The direction of this movement is opposite to the temperature gradient. There is a condensation of this moisture in these cooler layers, and liquid moisture again starts moving to the evaporation surface. Such a circulation of moisture is accompanied by a movement of salts to the surface layers (if they are present in the soil solution). This leads to a 'desalting' of the soil in the condensation zone. The thickness of the condensation zone is determined by the diurnal amplitude of soil temperature. 'Seasonal' vapor movement due to the temperature gradient proceeds in the whole of the soil strata, possibly up to the layer with a constant temperature. The downward transfer of vapor in summer proceed until the wilting point is achieved. The latter is the lower limit of soil moisture content in all cases, excluding the surface layer, even if the temperature gradient is operative. The drying of soil by roots to the lower limit wilting point results in vapor unsaturation of soil air. This phenomenon gives rise to vapor transfer towards this dry zone, independent of the direction of the temperature gradient. Plants in semideserts may grow for a long time after all the available moisture in the root zone has been exhausted. Apparently plants are supplied with moisture which has been transferred into the drying zone as vapor and became liquid. The existence of such a vapor transfer, independent of the direction of the temperature gradient, was demonstrated by experiments. (See also W70-09718 and W70-09568 thru W70-09592) (Knapp-USGS)
W70-09717

SOIL MOISTURE DISTRIBUTION FUNCTION IN NON-ISOTHERMIC CONDITIONS,
Ceskoslovenska Akademie Ved, Bratislava. Inst. of Hydrology and Hydraulics.
Julius Sutor.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 790-800, 1968. 11 p, 8 fig, 19 ref.

Descriptors: *Soil water movement, *Diffusion, Energy transfer, Mass transfer, Percolation, Convection, Capillary action, Laboratory tests, Permeameters, Soil physical properties.
Identifiers: Temperature gradients, Thermal soil moisture distribution function.

In order to evaluate the influence of daily and seasonal temperature fluctuations on the movement of soil water, it is necessary to know the physical quantities describing the quantitative and qualitative influence of temperature gradients upon moisture movement. The influence of the temperature gradient upon the movement of soil profile moisture, in addition to other quantities, can be expressed using the experimentally determined moisture distribution function along the applied temperature gradient. To obtain this function clay soil was chosen and an experimental closed system method was used. The curve of moisture distribution in a soil sample assumed characteristic symmetrical shapes. The mathematical analysis of these results showed that for a closed systems the curve of moisture distribution along the applied temperature gradient could be expressed within experimental error by a cubic equation. The choice of this function was verified by comparing quantitative transfer indicators of experimentally obtained values with those calculated from the function. RELATIONSHIP BETWEEN INFILTRATION AND GROUNDWATER HOUSEHOLD,
National Water Authority, Budapest (Hungary).
G. Kovacs.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 801-809, 1968. 9 p, 4 fig.

Descriptors: *Recharge, *Groundwater movement, *Soil water movement, Flow, Saturated flow, Unsaturated flow, Capillary action, Mathematical studies, Darcys law, Permeability, Infiltration, Hydrologic budget, Water table, Water levels.
Identifiers: Soil water-groundwater relationships.

In the unsaturated layer overlying the groundwater table water movement is influenced by gravity and adhesion. Effects of these two processes are added together concerning the groundwater space. The infiltrating recharge and water loss by evaporation

are related to the depth of the groundwater table. The difference of these two effects is determined by the characteristic curve of the groundwater regime as a function of the average depth of the groundwater. Because the difference is equal to the sum of all other effects, the water regime of the groundwater space can also be characterized by the average depth. A relationship can be found between the depth of the groundwater table and groundwater flow. Salinization of soils can also be linked to the groundwater regime. There are some hydraulic and soil science observations which justify the method described, but it is necessary to collect more data to characterize the processes investigated. THE METHOD OF GROUNDWATER RECHARGE EVALUATION IN SAND DESERT BY INVESTIGATION OF MOISTURE EXCHANGE IN THE ZONE OF AERATION,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. N. Chubarov.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 809-822, 1968. 14 p, 2 fig, 4 tab.

Descriptors: *Recharge, *Soil water movement, *Water vapor, Condensation, Evaporation, Diffusion, Arid lands, Sands, Moisture content, Convection, Hymidity, Moisture tension.
Identifiers: Soil water-groundwater relationships.

Study of the moisture content distribution through depth in the zone of aeration in small areas of sands covered with vegetation in the desert showed that this distribution is, even at great soil thicknesses (down to 40 m), a function of the potential of the gravitation field and the capillary potential. According to theoretical and experimental data, relationships are determined by which the moisture content and soil moisture conductivity coefficient respectively may be calculated. The relationships determined allow a series of moisture content curves to be calculated by which the direction and value of moisture flow in the zone of aeration may be determined. Comparison of a moisture curve obtained for small areas of barkhan sands showed that groundwater is recharged by atmospheric moisture at a rate of 10-20 mm per year. Supposition of the 'critical' moisture contents on the curve shows that the groundwater evaporation at the expense of liquid transportation under the conditions of sand deserts cannot occur at depths of more than 3 meters to the groundwater. Absence of the groundwater distribution elements at depths of more than 12-14 m (besides the diffusion process of 'underground' evaporation) accounts for the fact that the groundwater in the desert, as a rule, occurs at more 'critical' depths (more than 14 m) and is alinized to a smaller degree. THE TYPE SECTIONS OF ROCK MOISTURE IN THE ZONE OF AERATION AND ESTIMATION OF INFILTRATION VALUES,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. S. Markelova, N. A. Ogilvy, and V. N. Chubarov.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 827-840, 1968. 14 p, 6 fig, 15 ref.

Descriptors: *Infiltration, *Recharge, *Soil moisture, Soil water movement, Groundwater movement, Mathematical studies, Percolation, Surveys, Permeability, Moisture content, Field capacity, Porosity, Capillary water, Model studies, Mathematical models.
Identifiers: *Soil water-groundwater relationships.

If the zone of aeration is very thick, 3 subzones are distinquished in it having different characters of rock moisture content. A subzone in which the rock moisture content varies with depth as well as with time is situated at the top. With depth, moisture fluctuations fade and the upper subzone turns into that of quasi-stationary moisture. The latter in turn is replaced by the capillary fringe of groundwater. If the thickness of the zone of aeration is small, the middle subzone of quasi-stationary rock moisture may disappear and the capillary fringe will come into contact with the upper subzone of variable moisture or reach the ground surface. In uniform rocks, the moisture content in the middle subzone is constant and depends on the lithological composition of the rocks and infiltration rate. In heterogeneous rocks, each lithologically different layer has its own moisture content which corresponds to the infiltration rate under the given conditions. The infiltration rate is related to the natural rock moisture content and mximum moisture capacity by an exponential function. The relationships established allow the infiltration rate to be estimated by determining the rock moisture content in the subzone of quasi-stationary moisture. Furthermore, the infiltration rate may be determined using the water reserves in the upper soil layer. Using the data on these water reserves found in aqroclimatic reference books, average infiltration values were calculated for different regions of the European part of the USSR. Infiltration varies from 100 to 20 mm per year from north to south and agrees with the determinations made by Kudelin using river runoff analyses. (See also W70-09568 thru W70-09592) (Knapp-USGS)

USE OF THE HYDRO-INTEGRATOR FOR STUDYING THE FIRST STAGE OF FILTRATION FROM IRRIGATION CANALS,
All-Union Scientific Research Institute of Hydrotechnics and Reclamation, Moscow (USSR).
M. G. Kaltagova, and V. N. Korenev.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 865-874, 1968. 10 p, 4 fig, 5 ref.

Descriptors: *Canal seepage, *Infiltration, *Hydraulic models, Equations, Soil water movement, Percolation, Model studies, Groundwater movement, Flow, Porous media.
Identifiers: USSR.

The majority of irrigation canals are canals of periodical action, and for such canals water loss at the first stage of filtration and correct determination of filtration contours are of great importance. The use of a differential equation of infiltration to solve canal seepage problems is discussed. A hydraulic model (the hydro-integrator) was constructed to study seepage and infiltration problems. The All-Union Institute of Hydraulic Engineering and Melioration has carried out investigations of the first stage of filtration for canals varying in size and running in homogeneous, non-connected isotropic soil conditions. The filtration contour lines do not depend on permeability and water sorption factors of the soil. Changing of the latter will accelerate or slow down movement of the infiltration front. The canal width on the bottom has no effect on the value and form of lateral spreading, this being dependent on the depth of water filling the canal and on the disposition of the groundwater level. (See also W70-09726 and W70-09568 thru W70-09592) (Knapp-USGS)

FORMATION OF INFILTRATION FLOW FROM CANAL UNDER DEEP OCCURRENCE OF GROUNDWATER,
All-Union Scientific and Research Institute of Hydrotechnics and Reclamation, Moscow (USSR).
S. A. Guirshkan, I. P. Mochalov, and V. E. Rayn
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 874-879, 1968. 6 p, 2 fig.

Descriptors: *Unsaturated flow, *Canal seepage, Infiltration, On-site tests, Capillary water, Groundwater movement, Soil water movement, Saturated flow, Pore pressure, Nuclear moisture meters.
Identifiers: USSR.

Infiltration from a canal into a thick soil stratum above deep groundwater is discussed.

erogenous flow, the main moving phases are er and pore air. The pore air is displaced by in- ation water until the infiltration zone is formed the movement becomes stabilized. To study physical picture of infiltration from the canal l, experiments were carried out on a test soil lodnaya Steppe, Uzbekistan) using systematic ervation of infiltration from experimental als. Groundwater was at a depth of 20 m in n of the loess type, interlaid with sandy soils of erent density. Infiltration rate, formation of the tration zone before and after contacting the llary edge of the groundwater, saturation of the ous space with water, and distribution of pres- in the infiltration flow zone were observed. A ron moisture meter, designed at the All-Union ntific Research Institute, Hydraulic Engineer- and Melioration, named after Kostiakov, was for this purpose. As the moistening front es through the soil, saturation increases enly, which confirms experimentally the ex- ce of a saturation jump at the border of dis- ement of the porous air by infiltration water. also W70-09727 and W70-09568 thru W70- 92) (Knapp-USGS)

Ahmed.
ch resume. In: Water in the Unsaturated Zone, I, Proceedings of the Wageningen Symposium, Netherlands, June 19-25, 1966, International ciation of Scientific Hydrology, Publication 3, p 886-895, 1968. 10 p, 3 fig, 2 tab, 10 ref.

riptors: *Infiltration, *Drainage, *Unsatu- flow, Recharge, Soil water movement, ologic budget, Evapotranspiration, Water ice, Water levels, Water resources develop- , Water resources, Groundwater.
ifiers: *Pakistan.

work and studies in East Pakistan have so far confined to the occurrence of surface and ndwater with little or no regard to the unsatu- zone between the land surface and saturated materials. This zone has a significant in- ce on the distribution of both surface and ndwater, especially in a country where the system drains one of the heaviest rainfall areas e world. Moreover 80% of this precipitation rs during the monsoon months from June to mber, when at least 25% of the country is ed, high humidity persists and the maximum erature stays about 90 deg F. Water balance thus is a unique problem. The dynamic ef- on the water distribution by hydrologic sses in the unsaturated zone should be con- d in evaluating the total water resources of ountry. The movement of this water, particu- the rate, as well as the importance of this to evapotranspiration, drainage for agricul- productivity and its contribution to ground- reservoir is estimated. HORIZONTAL SEEPAGE THROUGH UNCONFINED AQUIFERS TAKING INTO ACCOUNT FLOW IN THE CAPILLARY FRINGE,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. G. Youngs.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 897-905, 1968. 9 p, 4 fig, 7 ref.

Descriptors: *Groundwater movement, *Mathematical studies, Infiltration, Seepage, Recharge, Flow, Porous media, Saturated flow, Water table, Darcys law, Soil water movement.
Identifiers: Groundwater flow equations.

Equations are given to calculate the horizontal component of groundwater movement between the top of the capillary fringe and a horizontal impermeable bottom boundary of an aquifer with a free water surface. Also considered are seepage through dams and drainage to ditches. Because infiltration flow is nearly vertical, total horizontal seepage may be considered to take place in the saturated flow region. (See also W70-09731 and W70-09568 thru W70-09592) (Knapp-USGS)
W70-09730

SOME OBSERVATIONS ON FLOW IN THE CAPILLARY FRINGE,
J. N. Luthin.
Text in English; French resume included. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, pp 905-909, 1968. 5 p, 1 fig, 1 tab, 11 ref.

Descriptors: *Soil water movement, *Groundwater movement, *Capillary fringe, *Computer models, Mathematical studies, Soil moisture, Hydraulic conductivity, Capillary conductivity, Percolation, Pore pressure, Unsaturated flow.
Identifiers: Capillary fringe movement.

A discussion if given of the effect of the capillary fringe on groundwater flow. It appears that the influence of the capillary fringe can be taken into account in calculations made with a computer, when the relationship between capillary conductivity and soil moisture content is known. For the steady state situation the modified form of the Laplace equation can be used satisfactorily in the computer for obtaining flow nets and flow into a facility or through some porous media. However, for the transient problem the situation is by no means clear. The computer relies upon some known relationship between the capillary conductivity of the soil and some other soil property that emergesfrom the solution. The relationship between the capillary conductivity and the soil moisture content must be inserted into the procedure in order to obtain a satisfactory solution. (See also W70-09708 and W70-09568 thru W70-09592). (Knapp-USGS)

MATHEMATICAL MODELS IN SOIL PRODUCTIVITY STUDIES, EXEMPLIFIED BY THE RESPONSE TO NITROGEN,
Institute for Land and Water Management Research, Wageningen (Netherlands).
W. C. Visser.
Miscellaneous Reprints 78, Plant and Soil, III, 2, April 1969, p 161-182. 22 p, 7 fig, 3 tab, 4 ref.

Descriptors: *Mathematical models, *Soil surveys, Nitrogen, *Computer programs, *Linear programming, *Growth rates.

A mathematical model was constructed for estimating crops yield, with the largest possible general significance for complex interaction of favorable and adverse factors. The model was constructed in order to have available a means of analyzing effects of growth factors which were less manageable than fertilizers, as is the case with the factors dependent on the water management. The growth equation formulated was described by a linear relation of mass flow, diffusion and root activity. The growth model was based on four hypotheses dealing with the stresses occurring in the plant in case of a non-harmoneous uptake of nutrients. In the growth equation a model for two factors were constructed. For the first factor the change in level of fertility of the soil after repeated applications of fertilizer was inserted. The second step was the construction of the part of the formula accounting for the adverse influence of high nitrogen applications. Five unknowns were determined and a first approximation obtained by a geographical solution. Results for nitrogen, phosphate, and potassium applications were given as well as a discussion of the effect unknown factors would have. The first model constructed used computers. The construction of the model was discussed step-by-step to show that at any separate point the relevant biological knowledge can be formulated and given its proper place. (Kriss-Cornell)

INFILTRATION EQUATIONS FROM RATE-OF-ADVANCE DATA,
Saskatchewan Univ., Saskatoon.
Donald I. Norum, and Don M. Gray.
Proceedings of the American Society of Civil Engineers, Journal of the Irrigation Drainage Division, Vol 96, No IR2, p 111-119, June 1970. 9 p, 2 fig, 13 ref, 2 append.

Descriptors: *Infiltration, Irrigation, *Infiltrometers, Groundwater movement, Permeability, Seepage, Coefficients, *Border irrigation, Irrigation water, *Equations, Canal seepage.
Identifiers: *Infiltration rate, *Irrigation advance, Flow depth.

A method was developed for determining infiltration equations from rate-of-advance data using solutions of the Lewis-Milne border irrigation equation, plotted in dimensionless form on logarithmic paper. Rate-of-advance data were superimposed on the solutions and the coefficients determined from the matching factors for the best fit curve. The basic assumption was that the depth of flow on the surface is constant. If sufficient data are available, the technique can be extended to determine the average depth of flow on the surface. SOILS AND THE MAINTENANCE OF THEIR FERTILITY AS FACTORS AFFECTING THE CHOICE OF USE OF LAND,
G. Aubert.

In Use and Conservation of the Biosphere, p 47-69, Unesco, Paris, 1969.

Descriptors: *Soil physical properties, *Soil chemical properties, *Soil conservation, *Fertility, *Soil environment, Soil aggregates, Soil analysis, Soil engineering, Soil erosion, Soil horizons, Soil microbiology, Soil moisture, Soil properties, Soil stabilization, Soil treatment, Soil water, Soil water movement, Soil-water-plant relationships, Agriculture, Forestry, Irrigation effects, Arid lands, Tropical regions.
Identifiers: *Agricultural practices, *Temperate zones.

With increases in world populations, soil productivities have been subjected to various pressures. The various productive uses of soils are outlined with emphases on agriculture and its counterpart, forestry. The concept of soil fertility and the difficulties in defining and measuring it are considered. Probably no human activity is as destructive to the whole spectrum of soil physico-chemical and biotic properties as agriculture. The most prominent problems are: (1) During early cultivation, root system changes, ploughing and irrigation alter the physical properties of the soil (2) Wind and water erosion overcome pedogenic factors, decreasing soil depths (3) Subsequent dessication, soil Na build-up and differential upper horizon erosion decreases fertility (4) Deteriorating oxidation-reduction conditions occur, particularly as results of irrigation (5) Soil nutrients may decrease, also lowering fertility (6) Leaching, with subsequent effects on soil salinity. Examples of these problems are drawn from all parts of the world, and methods of ameliorating their effects are outlined. Views of proper national resource utilization in terms of total national and world economics are advanced. It is argued that forms of soil resource development, both in time and space, must be rationally considered and the options carefully examined. (Casey-Arizona)

COASTAL ENTRAPMENT IN LAKE HURON,
Waterloo Univ. (Ontario).
G. T. Csanady.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 8 fig, 1 ref.

Descriptors: *Lake Huron, *Water circulation, *Cooling water, Nuclear powerplants, Mixing, Fluorescence, Dye releases, Bays, Diffusion, Water temperature, Pumping plants.
Identifiers: Concentration, Slick, Waterloo (Ontario, Canada).

In Lake Huron at Douglas Point, a study was made of the water exchange mechanism between the shore zone and the main mass of the lake. Earlier experiments had shown a tendency for the tagged cooling water of the Douglas Point Nuclear Power Station to remain trapped in the shore zone shuttling back and forth parallel to the shore. A saturation run was envisaged, consisting of a continuous discharge of Thodamine B dye for a period of some three weeks. After continuous sampling and fluorometric observations during these three weeks, it was concluded that no dye concentration build-up was observed except dye retention to a very minor extent in bays and other sheltered pockets of water. Owing to the fortunate choice of location near a dynamically active part of Lake Huron, the cooling water efflux from the Douglas Point station mixes readily with the main lake mass, so that no long-term build-up of concentrations need be feared. On a short-term basis, shore concentrations in the vicinity of the station can be almost as high as concentrations in the efflux. (Osborne-Vanderbilt)

MAGNITUDE OF WAVES ON LAKE BUTTE DES MORTS AND THEIR EFFECT ON LAKE DEPTH AND SEDIMENT DISTRIBUTION,
Wisconsin State Univ., Oshkoch. Limnology Lab.
Samuel S. Harrison.
Available from the NTIS as PB-194 055, $3.00 in paper copy, $0.65 in microfiche. Report of Investigations No. 2, August 1970. 45 p, 2 tab, 15 fig, 3 ref. OWRR Project A-027-WISC (1).

Descriptors: *Waves (Water), *Sediment transport, Beach erosion, *Bottom sediments, Mud-water interfaces, Lake beds, Limnology, *Sedimentation rates, Weather data, Wisconsin.
Identifiers: Lake Butte des Morts.

The relationship between wind speed and the height, wave length, and period of waves occurring on Lake Butte des Morts was established from field data collected during the summers of 1969 and 1970. Using this relationship, an estimate was made of the frequency of occurrence of waves of various magnitudes on the lake. A chart was constructed so that the orbital diameter and orbital velocity of water moving over the lake bed in response to waves of known magnitude in a known depth of water can be determined. Threshold-orbital-velocity curves for sand-size sediment are superimposed on the chart. The upper half of the Lake Butte des Morts is four to five feet deep. Because waves are of sufficient magnitude to move fine sand on an average of about 40 days per year, and coarse sand about 8 days per year in the upper end of the lake, the depth of this part of the lake is thought to be wave controlled. It is doubtful, however, that waves reach a magnitude sufficient to move the fine-grained organic-rich sediment in the lower end of the lake which is 8 to 9 feet deep.

BOTTOM SEDIMENTS OF LAKE MANAZALAH, EGYPT,
Alexandria Univ. (Egypt). Dept. of Oceanography; and Institute of Oceanography, Alexandria (Egypt).
Saad K. El-Wakeel, and Saad D. Wahby.
Journal of Sedimentary Petrology, Vol 40, No 1, p 480-496, March 1970. 17 p, 6 fig, 3 tab, 48 ref.

Descriptors: *Bottom sediments, *Lakes, *Deltas, Phosphorus, Organic matter, Particle size, Sands, Silts, Clays, Sedimentation.
Identifiers: *Nile River, Egypt.

Lake Manzalah is the largest of the Delta Lakes of Egypt. Grab samples were collected from the bot tom of the lake and subjected to mechanical an chemical analysis. The majority of samples ar badly sorted with an average median diameter o 85.6 microns. The predominant type of sedimen covering the bottom the lake is the complex typ sand-silt-clay followed in abundance by the claye sand and silty clay. There is a basinward increase i grain size of sediments. The average carbonat content is 34.88% and its distribution on the bot tom generally follows the same pattern of the grai size distribution of sediments. The average organi matter content is 2.56% whereas the organi matter content increases with the decrease of medi an diameter of grains. The C:N ratio range between 5 and 17 with an average of 9.7. Th average phosphorous content is 0.056%. Th phosphorous content increases with the decrease o median diameter of grains. Available ferric iron i sediments ranges betwee 0.2 and 3% with a average of 1%. Interrelations between the grai size, carbonate, organic matter, phosphorous an available iron are discussed. Descriptors: *Waves (Water), *Landslid *Reservoirs, *Tsunamis, *Hydraulic mod Mathematical models, Model studies, Bores.
Identifiers: Wave runup, Landslide waves.

Results of hydraulic laboratory tests of an ideali rockfall are presented, with the main parame being the ratio of rockfall width to water depth a Froude number. For a large range of these t parameters, a linear theory for the generation water waves by a similar mechanism is useful a guide to interpreting the results. For large value the two parameters, the linear theory is a marg usefulness. It is shown by means of the result two similar tests, with a geometric scale ratio 1:4, that a small model test can be used to pre the results to be expected from a large model even in the range where bores form, provided velocity time histories of the falling rock similar. ntifiers: *Lake Kinneret (Israel).

istence of internal waves in Lake Kinneret rael) was confirmed. In early May 1968, with ll developed thermocline, characteristic internal ves were observed, averaging 11 hours, occurg regularly at semi-diurnal intervals, correlated newhat with periodic west wind. In the hypolimn, large quantities of ammonium-nitrogen and hophosphate concentrations increasingly accuilated from May to December. Ratio of total ailable nitrogen to orthophosphates is high in bruary and decreases rapidly to mid-summer. similation rate and regeneration in epilimnion is out four times greater in spring than summer. nder prevailing lake conditions, during the composition of organic matter in hypolimnion, every phosphorus atom liberated as phosphate, 0 atoms of oxygen are used for oxidation of corsponding total quantity of organic matter. Study the epolimnion strongly suggests that the high ygen:phosphorus ratio reflects the high organic ntent of lake algae and particularly their high trogen:phosphorus ratio. High level of organic atter indicates that sediments are providing quanies of nutrients, particularly ammoniumtrogen. Biweekly samples of alkaline onophosphoesterases are measured. In bottom posits, content of organic carbon and Kjeldahl trogen is rather high. There are indications of cent enhanced eutrophication, supported by sults of pigment extraction from sediments. ones-Wisconsin)

very five-seven years there is a complete overturn f Lake Maggiore (Italy) waters. This study records oplankton distribution from surface to maximum epth. During the holomictic winter, a progressive ecrease of copepod densities in upper 50 meters ccurred from January to the end of March, with n increase in deeper layers. These individuals, verturned during winter holomixy to the deepest ayers, could not find enough food in those layers or energy to reach water layers more suitable from trophical point of view. This upward effort is afected by complete lack of vertical gradients in the cological parameters, as determined by the olomixy, and zooplankton does not generally move straight upward from deep to superficial waters. During the overturn, the deepest layers are recharged with oxygen. Nutrients, concentrated in deep water, are suddenly brought in high concentrations to the more superficial layers and abruptly made available for algal development, exactly when zooplankton feeders are numerically depressed. After full circulation, spring 1963, there was an algal surplus resulting in nutrient enrichment. Kinetics of an oligomictic lake at winters' ends are responsible for productivity for the year and even for some subsequent years. (Jones-Wisconsin)

NITROGEN DISTRIBUTION IN SOME WISCONSIN LAKE SEDIMENTS,
Wisconsin Univ., Madison. Dept. of Soil Science.
Dennis R. Keeney, John G. Konrad, and Gordon Chesters.
Journal of the Water Pollution Control Federation, Vol 42, No 3, Part 1, p 411-417, 1970. 3 tab, 20 ref.

Descriptors: *Nitrogen, *Distribution, *Wisconsin, *Lakes, *Sediments, Eutrophication, Phosphorus, Dissolved oxygen, Hypolimnion, Aquatic weeds, Sampling, Oligotrophic, Hardness (Water), Depth, Hydrogen ion concentration, Nitrogen compounds, Soils, Mineralogy, Ammonium compounds, Freeze drying.
Identifiers: Algal blooms, Mesotrophic, Soft water, Lake types, Wisconsin lakes.

Forms and distribution of nitrogen in some Wisconsin lake sediments as function of lake type and trophic level are reported. The distribution (based on total sediment organic nitrogen) of the various forms of nitrogen hydrolyzable by 6N HCl did not differ markedly among sediment samples. No consistent effects of location, water composition, pH, or carbonate content of the sediments were found in the organic-nitrogen distribution data. An average, about 45% of the organic nitrogen in sediments exists as unidentified acid-hydrolyzable and acid-nonhydrolyzable nitrogen. The hard-water lake sediment samples contained greater amounts of fixed ammonium-nitrogen compared with soft-water samples, indicating mineralogical differences. It is impossible, with the limited number of samples, to discern any effects of lake trophic level on the fixed and exchangeable ammonium-nitrogen contents of lake sediments. Similar forms of nitrogen occur in lake sediments as in soils, but the nitrogen distribution differs somewhat. Decrease in hexosamine-nitrogen accompanied by an increase in amino acid-nitrogen with increasing lake fertility level indicates a greater microbial turnover of organic nitrogen in oligotrophic lakes, probably due to the higher dissolved oxygen in the hypolimnionic waters. (Jones-Wisconsin)

Thermal requirements for aquatic life that will permit maximum use of Texas' resources are reviewed. Almost all Texas streams and reservoirs have been investigated by water quality studies, creel censuses, and continuous sampling of fish populations. Fish evolution in a newly constructed reservoir follows a pattern of exceptional growth of game fish during the first year or two. The game fish:rough fish ratio inverts after that period. Whereas initially total weight of game fish may exceed 50% of all fish taken, by the fourth or fifth year, coarse or undesirable fish dominate and usually make up about 75% of total nettable fish weight. Two Texas reservoirs, primarily used for cooling of steam electric power generation, have remained highly productive since impoundment and have maintained well-balanced fish populations; in these, no decline in game fish population with reservoir age, such as experienced in other Texas reservoirs, has occurred. This is attributed primarily to the result of water circulation and increased temperatures from the power plant. Operation of the steam electric plant increases the oxygen balance of the whole lake. The large flow of warm water can be an effective fish management tool. (Jones-Wisconsin)

NITROGEN LOSSES FROM ALKALINE WATER IMPOUNDMENTS,
San Diego State Coll., Calif. Dept. of Civil Engineering.
Frank E. Stratton.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 95, No SA2, p 223-231, 1969. 5 fig, 1 tab, 3 ref.

Descriptors: *Alkaline water, *Nitrification, *Nitrogen, Impoundments, Ammonia, Analysis, Analytical techniques, Hydrogen ion concentration, Temperature, Winds, Effluents, Lakes, Surface waters, California.
Identifiers: Elfin Forest Lake (Calif), Gaseous ammonia nitrogen, Degasification.

A method of estimating the loss of gaseous ammonia from alkaline waters consists of analysis of samples from outdoor impounded water subject to mixing by wind. Another method involves the use of a floating cell and acid trap to determine ammonia liberated from an impoundment. The field tests were conducted from June to September in two small California eutrophic impoundments: Elfin Forest Lake with pH 9.5-9.8, and a pH 9.1 effluent pond at the Santee Water Reclamation. The measured rate of loss of ammonia nitrogen for the Elfin Forest Lake was 3.3 milligrams per square foot/day, whereas that for the Santee pond, 9.1 milligrams per square foot/day. The determined values constituted 14% and 22% of the predicted values for these basins, respectively. (Wilde-Wisconsin)

MAN'S INFLUENCE ON LAKE ERIE,
Southern Illinois Univ., Carbondale. Dept. of Botany.
Jacob Verduin.
The Ohio Journal of Science, Vol 69, No 2, p 65-69, 1969. 1 fig, 2 tab, 12 ref.

Descriptors: *Lake Erie, *Ohio, Swamps, Farms, Silts, Light penetration, Biota, Nutrients, Phosphorus, Oxygen, Sewage effluents, Cisco, Walleye, Seiches, Mayflies, Hydrogen ion concentration, Photosynthesis, Nitrogen, Detergents, Phytoplankton, Benthic fauna, Carbon dioxide, Bloodworms, Yellow perch, Midges.
Identifiers: *Man's influence, Maumee River, Toledo (Ohio), Leucichthys artedi, Esox mosquinongy, Stizostedion vitreum, Hexagenia limbata, Asterionella formosa, Tabellaria fenestrata, Melosira ambigua, Melosira binderana, Fragilaria capucina, Coscinodiscus radiatus, Chironomus plumosus, Perca flavescens, Cladophora glomerata, Great Black Swamp (Ohio).

Conversion of northwestern Ohio's Great Black Swamp to farm land during the last half of the 19th century had a profound, but scantily documented influence on Lake Erie. Silts, once largely filtered by swampland vegetation, were, with the destruction of that vegetation, carried into Lake Erie, reducing light penetration and significantly altering the lake's biota. More recently enhancement of plant nutrients, especially phosphorus, which has increased 5-fold since 1948, has supported nuisance levels of plant growth creating severe oxygen depletion near the lake bottom and responsible for additional major and undesirable changes in species composition of plant and animal communities. The solution to this problem is removal of plant nutrients from the waters before they enter Lake Erie. The 'living filter' treatment, in which sewage plant effluents are filtered through root zones of plant communities, seems most promising. This treatment effectively removes nutrients, converting them to plant products. Another model, where effluent from sewage treatment plants is passed through a series of artificial lakes, processes the effluents effectively so that final-stage lakes are excellent recreational facilities, and the released waters do not burden aquatic environments. (Jones-Wisconsin)

PHOSPHATE IN LAKE KINNERETH,
Ministry of Agriculture, Haifa (Israel). SeaFisheries Research Station.
O. H. Oren, and Rosa Ravid.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 334-341, 1969. 3 fig, 3 tab, 7 ref.

Descriptors: *Lakes, *Phosphates, *Distribution patterns, Seasonal, Diurnal, Phosphorus, Thermocline, Depth, Beds under water, Oxygen, Temperature, Epilimnion, Hot springs, Chlorides, Calcium, Hydrogen ion concentration, Hypolimnion, Phytoplankton.
Identifiers: *Lake Kinnereth (Israel), Vertical distribution, Salt water carrier, Orthophosphates.

Lake Kinnereth (Israel) contains relatively large quantities of orthophosphate as well as total phosphorus which, during most years, are near the bottom--not in the whole hypolimnion. Integrated total quantity of total phosphorus does not change considerably in the whole lake, however the layers, containing phosphorus, do change. Before the end of the seasonal stratification, more than 40% of the total phosphorus is concentrated in the 30-40 meter layer, the minimum of total phosphorus in the 10-20 meter layer. In January, the layer between 30-40 meters is still undistrubed, while mixing has taken place in upper layers. In February a considerable percentage of the total phosphorus is still in the bottom layer, although decreased by 25%; at that time it is mainly found at the surface where spring phytoplankton bloom has begun. During March, minimal quantities of total phosphorus are found near the bottom, maxima at surface and upper layers. The phosphorus content of the lake is decreasing. This preliminary investigation shows the total quantity of orthophosphate has decreased in the four years since the salt water carrier has been in operation; this carrier contains quantities of phosphate and total phosphorus below the Tiberias Hot Springs. (Jones-Wisconsin)

Identifiers: *Astatic lakes, Alberta (Canada), Chain Lakes (Canada), Anostraca, Hordeum jubatum, Puccinellia nuttaliana, Distichlis stricta, Chenopodium glaucum, Chenopodium salinum, Suaeda depressa, Scirpus paludosus, Specific conductance, Lepidurus lemmoni, Branchinecta gigas, Branchinecta mackini.

This study was undertaken to gain information on one of the larger temporary saline waters of Alberta and its Anostracan fauna. Wanek Lake, one of the Chain Lakes (Alberta, Canada) lacks any surface outflow but is fed by intermittent streams in the springtime, resulting in a recurrent temporary pool. Its bed is composed of a mixture of rounded quartzite grains and clay and has excessive turbidity. Water depth decreases with time throughout the season. Total mixing is the usual condition in this very shallow lake. Changes in hydrogen ion concentration show a gradual increase during the season mainly due to evaporation. It is a sulphate-carbonate lake, with sodium and magnesium the predominant cations; concentrations of iron were unusually high. Two of the three species of euphyllopod Crustacea occurring in Wanek Lake--Branchinecta gigas and B mackini--were studied. Factors responsible for their disappearance before the lake dired up completely are considered. These preliminary observations on Wanek Lake reveal that we can observe an annual sequence of physical and chemical changes to which certain euphyllopods appear to be especially well adapted. EFFECT OF THE SOL-GEL TRANSFORMATION IN CLAY-WATER SYSTEMS ON BIOLOGICAL ACTIVITY: 2. SODIUM UPTAKE BY CORN SEEDLINGS,
Pennsylvania State Univ., University Park. Dept. of Soil Science; and Purdue Univ., Lafayette, Ind. Dept. of Soil Chemistry.
D. E. Baker, and P. F. Low.
Soil Science Society of America Proceedings, Vol 34, No 1, p 49-56, January-February 1970. 8 p, 9 fig, 2 tab, 24 ref.

Descriptors: *Clays, *Gels, *Soil-water-plant relationships, Ion transport, Ion exchange, Viscosity, Water chemistry.
Identifiers: Clay-water systems.

Homoionic Na- and K0 clay mixtures were prepared from Wyoming bentonite with water to produce clay-water systems. These systems were extruded through a hypodermic needle to orient the particles. Some of the systems were disturbed by tapping their containers on the laboratory bench. The following quantities were measured: viscosity; relative partial molar free energy of NaCl, KCl and HCl; and water tension. Viscosity, free energy of HCl, and water tension were decreased by disturbing the clay systems, whereas the free energies of both NaCl and KCl were increased. Samples of the clay systems were extruded around the radicles of corn seedlings. Na uptake was determined by analyzing the seedlings for Na-22. Na uptake increased curvilinearly with Na-clay content in the range 0-4% clay and then leveled off. In the curvilinear range, Na uptake was directly proportional to the free energy of NaCl. Na uptake was greater from the disturbed than from the undisturbed systems. Because the disturbance also increased the free energy of NaCl, it was concluded that Na uptake depended on this quality. THE EFFECT OF LAND USAGE ON AQUATIC AND SEMI-AQUATIC VEGETATION AT HIGH ALTITUDES IN SOUTHERN AFRICA,
Rhodes Univ., Grahamstown (South Africa). Dept. of Botany.
A. Jacot Guillarmod.
Hydrobiologia, Vol 34, No 1, p 3-13, 1969. 1 fig, 9 ref.

Descriptors: *Bogs, *Basalts, *Aquatic plants, *River systems, *Ecology, Conservation, Water flow, Grazing, Mining, Population, Ponds, Pondweeds, Gravels, Springs, Frost heaving.
Identifiers: *Southern Africa, *Lesotho, *Orange river, Kimberlite pipes.

ıe high altitude areas (7500 feet or greater) of ıuthern Africa serve as sources of several impor-nt rivers. The climate is harsh and rainfall and owfall are high. The topography is mainly a yered basaltic cap with volcanic vents, doleritic 'kes and kimberlite fissures. The river source eas lie mainly within the new state of Lesotho. ater flows over the basalt carrying practically no t. The river sources are ancient bogs formed on e highest mountain slopes and shallow valley ads. Most bogs are extensive and contain many rings that well up through kimberlite pipes. The getation forms a dense mat and is largely an-osperms and algae. The bogs therefore serve not ly as river sources, but also as regulators of the gh rainfall, filtering the waters through the gravel d vegetation. Population pressures have created tensified pastoral activities in Lesotho and the gh mountain areas are now being intensively azed. Grazing animals are penetrating into the gs, destroying crucial vegetation. Additionally, amond mining in kimberlite pipes is destroying e springs. The bogs cannot long stand these intru-ons and if they are destroyed, the river systems ill be critically damaged. A plea is made for ra-onal usage planning and regulation of these areas. escriptors: *Halophytes, *Chlorides, *Cations, Salt tolerance, *Plant growth, Osmotic pressure, lectrolytes, Salinity, Plant physiology, Soil-water-lant relationships, Calcium, Sodium, Magnesium, otassium, Plant growth, Turgidity, Water balance. lentifiers: *Salt-accumulating halophytes, *Salt-xcluding haliphytes, *Saltbush, *Australia, smotic adjustment.

eedlings of an Australian desert halophyte, triplex nummalaria, were grown in nutrient solu-ons of differing chloride concentrations ranging om 10-300 milliequivalents per liter and with dif-ering cations (K, Ca, Na, Mg). With Na, K and Mg hlorides growth was optimum at ranges of 100-00 milliequivalents per liter. Ca chloride caused oxic effects with increasing concentrations, which ere largely ameliorated when other cations were resent. Increased growth in NaCl solutions was ac-ompanied by increasing Na and Cl concentration nd no changes in assimilation, eliminating sub-titution of Na with K and increased photosynthetic fficiency as growth factors. Growth comparisons n media with increasing ionic concentrations in-icate that salt-excluding halophytes suffer from ow medium water potential while salt-accumulat-ng halophytes compensate by increasing internal smotic pressure. It is concluded that appropriate gricultural breeding for accumulation-type haracteristics would combine salt tolerance with rowth vigor. (Casey-Arizona)

CONVERGENT EVOLUTION OF MEDITER-RANEAN-CLIMATE EVERGREEN SCLEROPHYLL SHRUBS,
Stanford Univ., Calif. Dept. of Biological Sciences.
Harold A. Mooney, and E. Lloyd Dunn.
Evolution, Vol 24, No 2, p 292-303, June, 1970. 5 ig, 2 tab, 57 ref. National Science Foundation grants GB 5223, GB 8148.

Descriptors: *Leaves, *Chaparral, *Shrubs, *Semiarid climates, *Moisture stress, Germination, Soil moisture, Droughts, Root systems, Tempera-ture, Photosynthesis, Stomata, Respiration, Nutrients, Toxicity, Precipitation (Atmospheric), Soil-water-plant relationships.
Identifiers: *Sclerophyllous plants, *Evergreen leaves, *Mediterranean climates, Adaptation, Convergence, Annuals (Plants), Leaf drop, Overheating effects, Nutrient deficiencies, Fire damages, Overgrazing, Resprouting, Palatability.

The Mediterranean climatic type (summer drought, winter rain) occurs in 5 diverse, isolated parts of the world. In all areas the native vegetation is similar--a dense scrub dominated by deeprooted woody evergreen sclerophyllous species. The climate is severe with plant life because favorable soil moistures and favorable temperatures are out of phase resulting in only brief periods of vigorous growth. Many other unfavorable factors also exist. It is proposed that the adaptive possibilities of an area vary inversely with environmental stresses, explaining the high degree of vegetative convergence in Mediterranean areas. The development of the evergreen leaf is a result of the greater efficiency. In these climates, plants are prepared to photosynthesize immediately in favorable conditions, while surviving drought conditions without leaf shedding. The crucial adaptations are (1) Deep root systems enabling at least some soil moisture utilization throughout the year (2) Small leaves with proportionately greater water conducting tissue resulting in reduced desiccation susceptibility (3) Nutrient-gathering and nutrient-conservation mechanisms adapted to low soil nutrient levels in these areas (4) Seedling unpalability and fact resprouting following fires (6) Stem-flow mechanisms which trap and conserve moisture from rain. THE PHYSIOLOGY OF DORMANCY AND SURVIVAL OF PLANTS IN DESERT ENVIRONMENTS,
Hebrew Univ., Jerusalem (Israel). Dept. of Soil Science.
D. Koller.
In Symposium of the Society for Experimental Biology, Vol 23, p 449-469. Cambridge University Press, 1969. 7 fig, 9 tab, 36 ref.

Descriptors: *Arid lands, *Germination, *Photoactivation, *Temperature control, *Water control, Xerophytes, Semiarid climates, Ecology, Physiological ecology, Plant physiology, Moisture stress, Growth stages, Precipitation.
Identifiers: *Dormancy, *Regeneration buds.

The essential feature of plant dormancy is its reversibility under environmental control. In deserts moisture stress is the dominant limiting factor. Plant life is made possible only because rainfall is unevenly distributed in time and space and this is accentuated by soil properties creating differential soil moisture distributions. Since seed dormancy involves species survival, there is a universal imposition of regulating mechanisms on seed germination, ensuring it occurs only when survival probability is maximal. Precise sensitivity to ongoing environmental factors is therefore necessary and germination regulation is based on: (1) Selectivity of response mechanisms to environmental factors (2) Heterogeneity of germination requirements within the seed population. Selectivity mechanisms measure some combination of light, temperature and moisture. Numerous examples given show various seeds are capable of measuring temperature, their own depth in soil or water, the intensity, spectral composition or periodicity of light, soil water economy and soil physical properties. They may also mearure fluctuations over time, or various combinations, both simultaneous and sequential. Paradoxically, none of the germination regulation mechanisms described occurs solely in desert plants. (Casey-Arizona)

CHARACTERISTICS OF THE ROOTS OF SOME XEROPHYTES,
New Mexico Univ., Albuquerque, N. Mex. Dept. of Biology.
Howard J. Dittmer.
In: Physiological Systems in Semiarid Environments, Hoff, C. C. and Riedesel, M. L. (editors), p 231-238, University of New Mexico Press, 1969. 2 fig, 2 tab, 10 ref.

Descriptors: *Xerophytes, *Root systems, *Xylem, *Water conservation, *Soil properties, Arid lands, Bound water, Phreatophytes, Drought tolerance.
Identifiers: *Mycorrhizas, *Root nodules, Tap roots.

There are 4 major types of desert root systems: (1) Storage roots which have relatively thick, water-retentive epidermal layers (2) Long tap roots not enlarged into storage roots (3) Relatively large lateral roots confined to the upper few inches of soil (4) Shallow fibrous roots characteristic of grasses. Penetration depths, lateral root development and root densities varies among species and are functions of genetic potential and environmental conditions. Nearly all desert root systems have mycorrhizal associations which decrease with soil dryness. Bacterial nodules on leguminous plant roots are also less abundant in arid soils. Drought resistance is mainly due to anatomical adaptations. Desert plants have a higher percentage of root xylem in relation to their diameter than more mesic plants. This results in slower water movement and greater water storage. Additionally, special cortical cells and resinous substances increase bound water content. (Casey-Arizona)

PHYSIOLOGICAL SPECIALIZATIONS OF AMPHIBIANS TO HABITATS OF VARYING ARIDITY,
Minnesota Univ., Minneapolis. Dept. of Zoology.
William D. Schmid.
In: Physiological Systems in Semiarid Environments, Hoff, C. C., and Riedesel, M. L. (editors), University of New Mexico Press, p 135-142, 1969. 1 tab, 31 ref. National Science Foundation Grant GB-6920.

Descriptors: *Water conservation, *Amphibians, *Water balance, *Physiological ecology, *Metabolism, Animal behavior, Respiration, Animal physiology, Urine, Semiarid climates, Arid

lands, Aquatic animals, Xerophilic animals, Sodium, Osmotic pressure.
Identifiers: *Integument, *Urinary bladder, *Active transport, Fossorial animals.

Due to lack of behavioral and microclimatic factors involved in amphibian water conservation, it is necessary to discuss relevant problems on the bases of (1) Whole organisms (2) Integument and urinary bladder organs (3) Nitrogen excretion. Terrestrial species have greater desiccation tolerances and faster recovery from moisture stress than aquatic species. Current evidence suggests great directional rates of water movement in terrestrial species integuments. Behavioral avoidance related to fossorial habits may also be important in many terrestrial species. The skin and the urinary bladder function in the active uptake of Na. The urinary bladder is larger in terrestrial species and functions mainly as a water storage organ, where as it is primarily an excretory organ in aquatic species. Aquatic species excrete ammonia while semi-aquatic and terrestrial species excrete urea, thus avoiding toxic accumulation. The more terrestrial the life form, the greater is the tolerance to hyperosmotic urea. (Casey-Arizona)

BODY COMPOSITION OF THE KANGAROO RAT (DIPODOMYS MERRIAMI),
Nevada Univ., Reno. Desert Research Inst.
Leslie Startin.
In: Physiological Systems In Semiarid Environments, Hoff, C. C. and Riedesel, M. L. (editors), p 35-44, University of New Mexico Press, Albuquerque, 1969. 3 fig, 2 tab, 3 ref. Supported by Nevada Heart Association and National Science Foundation Grant GB-5217.

Descriptors: *Rodents, *Physiological ecology, *Animal metabolism, *Water balance, Animal physiology, Reproduction, Diets, Ecology, Semiarid climates, Arid lands.
Identifiers: *Kangaroo rat, *Body fluids, *Body solids, *Animal fats, Metabolic water, Mojave Desert.

The kangaroo rat is a nocturnal desert rodent capable of living without drinking water and active in all seasons in the Mojave Desert. Rats were trapped for a year (1967), and analyzed for water content, total body protein and solids, ash, fat and heart composition. Water content increased during the spring then decreased to a constant level for the rest of the year. The increase was correlated with a diet of greens during the primary reproductive period. The water content did not increase during unusually heavy summer rains and resulting greenery, indicating its independence of available environmental water except during periods of high metabolic demand. Total body protein, total body solids, ash and heart composition remained relatively constant over the entire year. Fat content increased in late spring and summer and decreased in fall and winter ranging from 1-9 percent. The generally low fat level is probably an adaptation to a mobile, speed-oriented was of life. Increases in fat content may be correlated with increases in seed consumption, since seeds are high in fats and oils. (Casey-Arizona)
W70-09968

OBSERVATIONS ON THE STRUCTURE AND FUNCTION OF THE KIDNEY OF THE VAMPIRE BAT (DESMODUS ROTUNDUS MURINUS),
Arizona Univ., Tucson. Dept. of Anatomy.
Roy Horst.
In: Physiological Systems In Semiarid Environments, Hoff, C. C. and Riedesel, M. L. (editors), p 73-83, University of New Mexico Press, Albuquerque, New Mexico, 1969. 2 fig, 1 tab, 24 ref. National Foundation Grant G-24043.

Descriptors: *Physiological ecology, *Metabolism, *Water balance, Osmotic pressure, Ureas, Urine, Mammals.
Identifiers: *Bats, *Kidneys, *Henle's loops, *Urine concentrating mechanisms, Blood.

The diet of blood of the vampire bat is about 80 percent water and 20 percent protein. The high protein intake ensures a high urea production. In one meal the bat ingests a volume almost equal to its body weight. Aerodynamic considerations dictate a weight-lowering, and a copious, isotonic, low urea urine is excreted just after feeding onset. Since the bats do not drink free water, they must effect a highly concentrated urine when urea production begins. The kidneys of healthy bats were sectioned and microscopically examined for anatomical structures relevant to highly concentrated urea formation. The descending limb of Henle's Loop has specialized epithelial cells while the ascending limb is designed more simply--the opposite of what would be expected from current theories of kidney function. Vampire bats and kangaroo rats secrete urine of similar concentrations, but the bat has only one-third as many Henle's Loop cells, indicating much greater efficiency in individual cells. The vampire bat therefore confronts and solves water problems much like desert animals. (Casey-Arizona)

CONTEMPORARY DEPOSITIONAL ENVIRONMENTS OF THE OMO DELTA,
Chicago University, Ill. Dept. of Geography.
Karl W. Butzer.
Nature, Vol 226, No 5244, p 425-430, May 2, 1970. 6 p, 1 fig, 15 ref.

Descriptors: *Sedimentation, *Deposition (Sediments), *Deltas, *Lakes, Geomorphology, Flood plains, Bottom sediments, Paleoclimatology, Channels, Geology, Sediments.
Identifiers: Africa, Ethiopia, Lake Rudolph, Omo Delta, Omo River.

Geomorphological and sedimentological studies of depositional environments of the modern Omo River Delta and floodplain were made for understanding of the Pliocene to Pleistocene formations of the lower Omo Basin (southwestern Ethiopia). The lower Omo Basin has a semi-arid tropical climate. Mean annual precipitation is about 350 to 600 mm. Rainfall is lowest around the shores of Lake Rudolf (at 370m) and increases rapidly in the highlands along the northern peripheries of the basin. The Omo River is the only perennial stream of the Lower Omo Basin and of the entire Rudolf Basin. Active sedimentation is optimal today in the lowland plains on floodplains, deltas, mudflats and in littoral situations. The standing waters of interdistributary basins and bays, of the open prodeltaic environment, of the lagoonal flats, or of the seasonally flooded plains can produce remarkably similar sediments. Differences and distinctions must be deduced from bedding properties, oxidation, evaporites, vertical and horizontal development, and geomorphological settings. It is necessary to interpret sedimentary sequences with great care, with reference to strictly defined concepts, and if possible with respect to modern depositional counterparts. (Knapp-USGS)
W70-09542

FIELD METHODS FOR MEASUREMENT OF FLUVIAL SEDIMENT,
Geological Survey, Washington, D.C.
Harold P. Guy, and Vernon W. Norman.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, D.C. - 20402 - Price $0.70. U S Geological Survey Techniques of Water-Resources Investigations, Book 3, Chapter C2, 1970. 59 p, 29 fig, 3 tab, 57 ref.

Descriptors: *Sediments, *Sediment transport, *Sampling, *Measurement, *On-site data collections, Surveys, Investigations, Instrumentation, Sediment yield, Provenance, Particle size.
Identifiers: U S Geological Survey, Water resources investigations.

Field methods for the measurement of fluvial sediment are described. It is desirable that the persons involved in sediment measurements be familiar with the basic sediment concepts and the equipment and techniques to be used for making timely and efficient sediment measurements. The characteristics and limitations of commonly used samplers and some of the modifications of this equipment for special measurements are described. The characteristics of measurement sites, the selection of sampling vertical and transit rates, the methods of making sediment-discharge measurements, sampling quality control and timing, and some of the requirements for sediment-related data are discussed. (Knapp-USGS)

SEDIMENTATION, ANNOTATED BIBLIOGRAPHY OF FOREIGN LITERATURE, 1967-1968 SURVEY NO 5.
Department of Agriculture, Washington, D.C.; and National Science Foundation, Washington, D.C.

Available from NTIS, Springfield, Va. as TT 69-55007, $3.00 in paper copy, $0.65 in microfiche. Jerusalem, Israel Program for Scientific Translations, Ltd, 1969. 395 p.

Descriptors: *Bibliographies, *Sedimentation, *Foreign research, *Abstracts, Publications, Sediment transport, Deposition (Sediments), Erosion, Sedimentology.
Identifiers: Sedimentation bibliography.

The fifth volume of the annotated bibliography of foreign literature on sedimentation contains 1158 entries covering literature published outside the English-speaking world. The entries are arranged alphabetically by author, and a subject index is provided. This volume comprises material covering the years 1967-1968; an additional cumulative subject index covers the preceding volumes. The literature survey covered mainly periodicals, but also monographs, individual pamphlets and collected papers. The sources used were available at scientific and technical libraries in Israel, and special subscriptions were entered for a number of additional periodicals. The source languages for this issue

were: Armenian, Azerbaijani, Belorussian, Bulgarian, Czech, Dutch, English, Flemish, French, Georgian, German, Greek, Hebrew, Hungarian, Italian, Japanese, Lithuanian, Mongolian, Norwegian, Polish, Portuguese, Rumanian, Russian, Serbo-Croat, Slovak, Spanish, Swedish, Turkish, and Ukrainian. DEPOSITIONAL ENVIRONMENTS OF LAKE SUPERIOR SANDS THROUGH GRAIN SIZE ANALYSIS,
Wisconsin State Univ., Superior. Center for Lake Superior Environmental Studies.
Albert B. Dickas.
Available from the NTIS as PB-194 029, $3.00 in paper copy, $0.65 in microfiche. Center for Lake Superior Environmental Studies, Contribution No 15 (1970). 16 p, 1 tab, 5 fig. OWRR A-023-WISC (3).

Descriptors: *Particle size, *Sediments, *Lake Superior, Wisconsin, Rain, Littoral, Neritic, *Deposition (Sediments), Lake soils.
Identifiers: Pales-environments, Phi deviation.

As part of the problem of recognizing and reconstructing paleo-environments of arenaceous units in western Lake Superior, grain size parameters of modern fluvial, littoral and inner neritic lake sediments have been analyzed. Similar studies are reported from other geographic areas. While environmental field boundaries are of certain of these studies are curved and ill defined, other boundaries are differentiated on a linear basis, the system employed here due to the ease with which such a boundary is defined. Of all available graphs, that of phi deviation versus the diameter was found to be the most successful as it correctly classified 87.6 percent of all samples into a fluvial and a non-fluvial field. Further differentiation of non fluvial fields is displayed. While the method presented here is quite functional, correlation with other studies indicated that differing lines of separation between genetic fields must be determined on the local geographic level as predetermined by depositional energy factors. (See also W70-09674)

SEDIMENTS AND GEOLOGY OF BOIS BRULE RIVER, WESTERN LAKE SUPERIOR,
Wisconsin State Univ., Superior. Center for Lake Superior Environmental Studies.
Albert B. Dickas, and Paul C. Tychsen.
Reprint from Proceedings, 12th Conference Great Lakes Research, International Association of Great Lakes Research, p 161-169, 1969. 6 fig, 10 ref. OWRR A-023-WISC (6).

Descriptors: *Sediments, *Bed load, *Geology, *Particle size, Lake Superior, Wisconsin.
Identifiers: *Clastic material, Bois Brule River, Glacial cover.

A sedimentary analysis was made of the bed load (i.e. traction load) of the Bois Brule River, Douglas County, Wisconsin to better understand the statistical characteristics of the clastic material being transported by this stream and its contribution to the Holocene sedimentation history of the Wisconsin shoreline of Lake Superior. In addition, bedrock and glacial deposits were mapped throughout the drainage basin. The average mean size distribution of the clastic load, based on the phi scale, is as follows: 10% granules, 74% sand, 13% silt and 3% clay. To determine whether this dominantly sand-sized sediment was derived from basement rock or glacial debris, stream gravels larger than granule size were petrographically analyzed and compared to surficial and basement rock maps. Results indicate that the glacial cover is the prime source of the clastic material of the river load, concurring with the mapping program which shows that outwash sands and reworked glacial drift predominate over much of the drainage area. A secondary source is outcropping Keweenawan (Cambrian) sandstones. Earlier studies indicate the river load is deposited in Lake Superior out to a distance of 1/2 - 1 mile from the shoreline with the finer material found at the greater distance from the littoral zone. THE COLUMBIA RIVER AS A SOURCE OF MARINE LIGHT-SCATTERING PARTICLES,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Hasong Pak, George F. Beardsley, Jr., and P. Kilho Park.
Journal of Geophysical Research, Vol 75, No 24, p 4570-4578, August 20, 1970. 9 p, 8 fig, 17 ref. ONR Contract N00014-67-A-0369-0007.

Descriptors: *Suspended load, *Columbia River, *Turbidity, *Light penetration, Optical properties, Surveys, Suspension, Turbidity currents, Water quality, Continental slope.
Identifiers: *Light scattering.

The Columbia River plume region was investigated from June 20, to July 3, 1968 by light-scattering measurements and standard hydrographic station observations. The Columbia River plume was traced for 200 km by the light-scattering particles in the plume water. The scatterers are estimated to be contained in the plume water for at least 30 days. The observed distribution of particles indicates a northward deep current under the plume near the river mouth, a subsurface offshore flow near the bottom of the plume along the northern Oregon coast, and a major surface flow to the south and southwest. (Knapp-USGS)
W70-09690

EVALUATION OF GRAIN-SIZE PARAMETERS IN LACUSTRINE ENVIRONMENTS,
Computer Data Processors Ltd., Calgary (Alberta); and Calgary Univ. (Alberta). Dept. of Geology.
J. T. Solohub, and J. E. Klovan.
Journal of Sedimentary Petrology, Vol 40, No 1, p 81-101, March 1970. 21 p, 11 fig, 1 tab, 18 ref.

Descriptors: *Particle size, *Sedimentation, *Lakes, *Statistical methods, Regression analysis, Correlation analysis, Deposition (Sediments).
Identifiers: Factor analysis, Sedimentary environments, Depositional environments.

Using an area of recent lacustrine sedimentation as a reference model, several methods of treating grain-size distribution of sands were evaluated for their ability to discriminate between or identify, depositional environments. The techniques of Passega (1957), Mason and Folk (1958), Friedman (1961), Sahu (1964), and Klovan (1966) were applied to sediment samples from known depositional settings. Of the methods, only factor analysis (Klovan, 1966) produced mappable results consistent with known energy conditions at the depositional sites. The lack of success of the methods may result from any or all of the following factors: (1) Standard bivariate plots cannot adequately express the complex processes producing particular grain-size distributions. (2) Grain-size parameters are merely descriptors of grain-size distributions. As such they may not contain all available information, nor perhaps of the right kind, to enable environmental determination. (3) Combinations of amount and type of kinetic energy (which may be primarily responsible for the grain-size distribution of a sand) may produce similar distributions in different environments. The hypothesis that grain-size distributions can identify depositional environments is probably not universally valid. It is concluded that grain-size distributions reflect depositional processes rather than environment and that the two need not be the same. (Knapp-USGS)

Robert Ehrlich, and Bernhard Weinberg.
Journal of Sedimentary Petrology, Vol 40, No 1, p 205-212, March 1970. 8 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Particle shape, *Statistical methods, *Fourier analysis, Sedimentation, Analytical techniques, Sedimentology.
Identifiers: Particle shape classification.

Grain shape may be described as precisely as needed by Fourier series expansion of the radius about the center of mass utilizing coordinates of peripheral points. Empirical results of grains from typical samples indicate that the series contains, in partitioned from, a large amount of geologically interesting information. Consequently, previous subjective evaluations of the worth of shape variations in the solution of geologic problems are justified. The shape variable is amendable to semiquantitative graphical evaluation or may be used as data for multivariate analytical schemes. Illustrative examples show that the shape variables easily discriminate grain differences arising from geographic, stratigraphic, and process factors. (Knapp-USGS)

THE KARST LANDSCAPE OF YUCATAN,
National Academy of Sciences-National Research Council, Washington, D.C. Foreign Field Research Program.
William A. Finch, Jr.
Report available from NTIS as AD-679 464, $3.00 in paper copy, $0.65 in microfiche. Report 1968. 169 p, 41 fig, 16 tab, 70 ref, 3 append. ONR Contract N00014-67-A-0244-0001 NR 389-105 Subcontract No 79.

Descriptors: *Karst, *Geomorphology, Groundwater movement, Caves, Topography, Tropical regions, Humid areas, Wet climates, Limestones, Drainage effects, Drainage patterns (Geologic), Subsurface drainage.
Identifiers: Mexico, Yucatan.

A descriptive regional analysis was made of the physical aspects of Yicatan's karst landscape. Different types of karst land forms characterize individual types of horizontal limestone which underlies Yucatan. Distinctive microenvironments

characterize the individual types of karst land forms. Distinctive floristic communities are associated with these micorenvironments. The areal distribution of the different types of karst land forms yields a pattern which provides the regional framework used in this study. Three regions occur in Yucatan's karst landscape. Each region possesses a distinctive karst land form assemblage. These are (1) The Coastal Karst Region where fresh water springs flow from underground fissures creating less saline environments in the normally saline barrier beach, lagoon, and mangrove environments; (2) The Central Karst Region where cenotes, aguadas, and dolines are the common karst land forms; and (3) The Hill Karst Region where occur a multitude of caves. Appendices include a brief survey of karst literature, representative climatic data for Yucatan, and a selected glossary of Maya and Spanish landscape terminology. (Knapp-USGS)

ABOUT TURBULENT DIFFUSION OF SUSPENDED PARTICLES IN FLUID FLOW,
V. S. Sineltshikov.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D5, p 42-46, 1967. 5 p, 9 ref.

Descriptors: *Suspension, *Settling velocity, *Aeration, Hydrodynamics, Bubbles, Flow, Mixing, Air entrainment, Mathematical studies, Sediment transport.
Identifiers: Two phase flow.

Distribution of suspended particles with high magnitude of fall velocity is analyzed by hydrodynamical methods. The distribution of these particles is found to be similar to that of ideal gas molecules or Brownian particles in the field of gravity. The results obtained are used to describe air-bubbles distribution in aerated flow. (Knapp-USGS)

USE OF RADIOISOTOPES IN SEDIMENTOLOGY (FRENCH),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
G. Courtois.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/9, p 117-165, 1967. 49 p, append, 262 ref.

Descriptors: *Tracers, *Tracking techniques, *Radioisotopes, *Sediment transport, *Reviews, Bibliographies, Sediment load, Sedimentology, Radioactivity techniques, Bed load, Suspended load, Sampling.
Identifiers: Sediment tracing.

Radioisotopes have two main uses in sedimentology: they are used for the study of sediment movements in rivers and seas, and for continuous measurements of the amount of sediment suspended in a given medium. The technical aspects of using artifical tracers include the choice of radioisotope, surface and mass labelling (with particular reference to the problem of silting), immersion and detection equipment, and problems of navigation and topographical reference points. The problem of obtaining quantitative results is discussed and the proposed methods are described. The methods described may also be applied to related problems of considerable importance (soil erosion, soil stabilization and the movement of sand dunes) and brief references are made to these problems. Since the transport of suspended solids is generally much more significant than bed-load movement, continuous measurements are of great importance. A number of examples are given of the value of information obtained by such measurements. Other radioisotope techniques which may also be used in sedimentology are dating, analytical studies (either continuous analysis of core samples by means of X-ray flourescence or the detection of trace elements by activation analysis), use of tracers, for example for the study of particle movements when affected by freezing of the soil or for the study of the formation and precipitation of sediment as a function of the physico-chemical characteristics of the waterbody, and measurements of sediment density by means of back-scattering gages. A bibliography of 262 references is included. (See also W70-09868) (Knapp-USGS)

In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/11, p 167-180, 1967. 14 p, 7 fig, 5 ref.

Descriptors: *Sediment transport, *Silts, *Tracers, *Tracking techniques, *Dredging, Waste disposal, Path of pollutants, Radioisotopes, Radioactivity techniques, Topography, Bed load, Suspended load, Estuaries, Currents (Water).
Identifiers: Dredging spoil.

The techniques used in a series of investigations into silt movement from spoil grounds in the Forth estuary are described. The tracers used were Sc-46 and La-140, incorporated in ground glass which was distributed in spoil in a hopper and deposited to stimulate normal dredging practice. Qualitative tracer movement was measured in the estuary and quantitative values were obtained in a dockyard by measurement of the vertical distribution of the tracer. The extensive upstream movement of spoil from the normal area of deposition showed that it was an economically unsatisfactory spoil ground. An alternative area was selected by study of the topography of the estuary bed and the prediction of downstream silt movement from this area was confirmed by tracer studies. SURFACE LABELLING OF SAND WITH Cr-51 BY THERMAL DECOMPOSITION OF AMMONIUM DICHROMATE Cr-51,
Australian Atomic Energy Commission, Sutherland (Australia).
B. L. Campbell, and B. W. Seatonberry.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No Sm-83/15, p 227-232, 1967. 6 p, 2 fig, 10 ref.

Descriptors: *Tracers, *Tagging, *Sands, *Tracking techniques, *Radioisotopes, Radioactivity techniques, Chromium, Chemical precipitation, Erosion, Sediment transport, Beaches, Littoral drift, Bed load.
Identifiers: Chromium radioisotopes.

A new and efficient method for labelling sand with multicurie amounts of Cr-51 is described. It is based on the formation of chromic oxide when ammonium dichromate is thermally decomposed. The technique has been used successfully with silica sand from Botany Bay, N. S.W. The ammonium dichromate is intimately mixed with the sand and then decomposed by raising the temperature while keeping the mass stirred. About 70% of the chromic oxide adheres to the sand. The radioactive label is stable over long periods of immersion in sea water and is resistant to the type of abrasion which can occur in sand-tracing experiments. The application of this method to the production of 25-kg batches of labelled sand is described. It is possible that the method could be applied to other granular solids which are stable up to 400 deg C. (See also W70-09868) (Knapp-USGS)

SURFACE DEPOSITION OF RADIOISOTOPES ON SAND AND SILTS (FRENCH),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
H. Bougault, A. Caillot, G. Courtois, and B. Jeanneau.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/16, p 233-262, 1967. 30 p, 11 fig, 3 tab, 6 ref.

Descriptors: *Tagging, *Sands, *Silts, *Tracers, Sediment transport, Gold radioisotopes, Chromium, Radioisotopes, Radioactivity techniques, Chemical precipitation, Bed load, Suspended load, Tracking techniques.
Identifiers: Chromium radioisotopes.

There are two major methods of using radioisotopes to study sedimentary movements. In mass-labelling, the sediment is replaced by a glass containing an element that can be activated, and in surface labelling, a physico-chemical treatment makes it possible to deposit a radioisotope on the surface of the sediment. Surface labelling is used mainly for sands, when a large number of labelled particles is necessary (for statistical purposes); and for silts, when it is necessary to retain the features associated with their dynamic properties. Simple and rapid methods of labelling were developed to be applied at the site of the experiment by persons possessing only limited equipment for handling radioisotopes. The process recommended for labelling sands by using Au-198 is a combination of the Petersen method (treatment with tin chloride) and that of Campbell (treatment with silver) after pre-treatment with nitric acid and soda. By this method, it is possible to deposit 125 mg of gold per kilogram of sediment with an efficiency of 95%.

For marking sands with Cr-51 a film of silica gel is first deposited and radioactive lead chromate is then adsorbed on to it. In this way, 500 mg of chromium per kilogram of sand can be fixed with more than 90% efficiency. The labelling of silts by using Au-198 is achieved with a neutralized chlorauric acid solution. The gold is reduced on contact with the silt on which it is fixed. Ten Ci/kg of sediment can be fixed with 100% efficiency. (See also W70-09868) (Knapp-USGS)

In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/19, p 271-290, 1967. 20 p, 8 fig, 1 tab, 6 ref.

Descriptors: *Sediment transport, *Bed load, *Tracers, *Tracking techniques, Radioactivity techniques, Radioisotopes, Stochastic processes, Statistical methods, Mathematical studies.
Identifiers: *Yugoslavia, Danube River.

Investigations of fundamental kinetic characteristics of bed-material discharge can be carried out by means of radioactive tracers. Tracer experiments were accomplished on the Danube and Velika Morava Rivers, and were supported by the International Atomic Energy Agency. A theoretical base is given for the study of the kinetic characteristics of bed-material discharge. Practical applications of the results are discussed. Theoretically, the problem of bed-material discharge was considered as a stochastic process. (See also W70-09868) (Knapp-USGS)

EROSION BY RAIN IN THE WESTERN CONGO (FRENCH),
Universite Lovanium de Kinshasa (Congo).
J. de Ploey.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy andGeophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/14, p 291-301, 1967. 11p, 7 fig, 8 ref.

Descriptors: *Soil erosion, *Sands, *Impact (Rainfall), *Tracers, *Radioactivity techniques, Tracking techniques, Radioisotopes, Rainfall-runoff relationships, Grasslands.
Identifiers: Congo.

Vast expanses of the western part of central and southern Africa are covered with uniform, sandy formations of the Kalahari type. The topography of these areas and their present morphological characteristics are mainly the result of erosion by rain. Information on the hydrology of the surface waters in these areas is fairly limited and is insufficient to permit any conclusion regarding the way in which erosion by rain takes place. To obtain a better understanding of these phenomena, Sc-46 labelled radioactive sand was used to trace rain erosion. Series of labelled samples were placed successively on the surface of the experimental plot and the erosive effect of rain was determined by measuring the residual concentrations after rainfall. Some samples were placed below a shield so as to eliminate the effects of splash and reveal the part played by runoff. Radiographic films were used to study the dispersion of labelled particles in the surrounding area. This radiographic method made it possible to determine the scale of erosion by splash for different rainfall conditions. Erosion by rain on Kalahari ground covered with sub-steppe savannah is caused mainly by splash erosion and by dispersed, intermittent runoff. Sheet-wash plays no part if the slope is less than 12 deg. (See also W70-09868) (Knapp-USGS)

LOESS--THE YELLOW EARTH,
Leeds Univ. (England); and BISRA-The Inter-Group Labs. of British Steel Corp., London (England).
I. J. Smalley, and R. L. S. Taylor.
Science Journal, Vol 6, No 2, p 28-34, Feb 1970. 7 p, 9 fig.

Descriptors: *Loess, *Deposition (Sediments), Soil types, Soils, *Soil formation, Soil structure, Soil stability, Soil erosion, *Aeolian soils, Finegrained soils, Geographical regions, Soil properties, Agriculture.
Identifiers: Soil maps, *Soil deposits.

Loess, an extremely fine earth formed by aeolian deposition, covers vast tracts of the world's land surface, sometimes to the depth of 100 m. Loess is an excellent agricultural soil and has had considerable influence on the development of civilization. Several theories of deposition and formation of loess particles are discussed. Glaciers are suggested as the main producers of loess material. When a glacier melts, a load of detritus containing 2 distinct sizes of quartz particles is deposited. Separation of fine particles and deposition as homogeneous deposits some distance away provide the sediments called loess. The fine particles are lifted by the wind, the nature of the transported material being controlled by a lift factor and a carry factor. Very small particles cohere tightly and large particles are too heavy to move. The wind lifts most efficiently particles having diameters of about 0.08 mm (the lift factor). The critical particle size above which particles are not carried by the wind in suspension is about 0.2 mm (the carry factor). In this way, the lift factor imposes limits on the eventual loess deposit, and the carry factor reinforces the limits. Once deposited, the relatively high cohesive forces keep the loess stable and erosion occurs only if the material is disturbed. (USBR)

TESTS OF THEORETICAL CALCULATIONS OF DISCHARGES OF SUSPENDED SEDIMENT IN PLAINS RIVERS,
K. V. Razumikhina.
Tr Gos Gidrol Inst No 156, p 31-38, 1968. Bur Reclam Transl 828, Jan 1970. 18 p, 4 fig, 4 tab, 8 ref.

Descriptors: *Fluvial hydraulics, Foreign research, Mathematical analysis, *Suspended sediments, River flow, Sediment transport, Chezy equation, *Sediment discharge, Streamflow records, *Turbidity, *Rivers, Roughness (Hydraulic), Grain sizes, Reservoirs, *Bottom sediments, Flood plains, Hydrographs, Discharge (Water), Streambeds, *Sedimentation.
Identifiers: USSR, High flow, Flood stages.

Formulas are presented for computing the discharge of suspended sediment in plains rivers. The formulas relate the turbidity of the flow to the sediment discharge through computation of scour turbidity (related to streamflow characteristics) and a hydromechanical sediment parameter (related to sediment composition and streamflow characteristics). Granular roughness of the streambed is determined by analysis of particle size. Computed and measured values of the sediment discharge are compared for various phases of the flow regime, including low flows and spring floods. The relationship between measured river discharge and suspended discharge depends on river characteristics; the rivers studied are classed into 3 groups. Recommendations for application of the formulas and the limits of applicability are discussed. (USBR)

VARIATION OF CATION EXCHANGE CAPACITY AND RATE WITH PARTICLE SIZE IN STREAM SEDIMENT,
Geological Survey, Denver, Colo.
Ronald L. Malcolm, and V. C. Kennedy.
Journal Water Pollution Control Federation, Vol 42, No 5, Part 2, p R153-R160, May 1970. 8 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Ion exchange, *Sediments, *Particle size, Bed load, Suspended load, Cation exchange, Gravels, Silts, Sands, Clays, Clay minerals, Sediment transport, Sedimentation, Water chemistry, Water quality, California.
Identifiers: Mattole River (Calif.).

A potassium specific-ion electrode was used to determine the rate of Ba-K/exchange and the cation exchange capacity (CEC) of the size-fractionated stream sediment from the Mattole River of northern California. The time required for 75 percent completion of exchange ranged from 3 sec for clay fractions to 12 hr for gravels. The average CEC of the clay, silt, sand, and gravel fractions were 37.6, 11.0, 9.7, and 7.2 meq/100 g, respectively. Organic matter contributed about 15 percent of the total cation-exchange capacity of the

sediment. The CEC of the sand and gravel fractions exclusive or organic matter were 5.5 to 8.0 meq/100 g; they must be included in a consideration of the total exchange, chemical properties, and transport phenomena of the stream. (Knapp-USGS)

CARBON AND OXYGEN ISOTOPE FRACTIONATION IN THE SKELETAL CARBONATE OF REEF-BUILDING CORALS,
Pennsylvania State Univ., University Park. Dept. of Geology and Geophysics.
Jon N. Weber, and Peter M. J. Woodhead.
Chemical Geology, Vol 6, No 2, p 93-117, July 1970. 25 p, 3 fig, 5 tab, 81 ref. NSF Grant GA-1437.

Descriptors: *Stable isotopes, *Water chemistry, *Coral, *Calcium carbonate, Sediments, Provenance, Chemical precipitation, Carbon, Oxygen, Tracers, Tracking techniques, Mathematical models, Reefs, Carbonates, Limestones.
Identifiers: Isotope fractionation, Australia, Great Barrier Reef.

Study of geochemistry of carbonate sediments and carbonate rocks is aided by a detailed understanding of the isotopic composition of the various sediment contributors. The coelenterates are of particular interest in this respect because the stable isotope ratios of their skeletons are controlled by both vital and inorganic environmental factors. To determine the relative importance of these factors, 475 specimens in 50 genera were selected from the coral population of Heron Island on the Great Barrier Reef of Australia. The samples were taken from tow depth environments: (1) surface, defined as 0-4.6 m; and (2) 18 m. The observed range of C-13 variation is 1.3% with respect to PDB standard carbon dioxide; that of 0-18 is 0.4%. A MODEL INCORPORATING BOTH BIOLOGICAL AND ENVIRONMENTAL FACTORS WAS DEVELOPED TO ACCOUNT FOR ISOTOPE RATIO VARIATIONS IN COELENTERATE CARBONATE. The analytical data are consistent with the model. At a specific reef locality, the most important factors causing isotope ratio variations in the skeletal carbonate of corals are zooxanthellar activity and temperature. (Knapp-USGS)

THE OCCURRENCE OF THALLIUM IN SEA WATER AND MARINE SEDIMENTS,
Liverpool Univ. (England). Dept. of Oceanography.
A. D. Matthews, and J. P. Riley.
Chemical Geology, Vol 6, No 2, p 149-152, July 1970. 4 p, 2 tab, 6 ref.

Descriptors: *Trace elements, *Sea water, *Sediments, *Thallium radioisotopes, Neutron activation analysis, Sampling, Chemical analysis, Geochemistry, Water chemistry, Minerology, Clay minerals, Ion exchange, Adsorption.
Identifiers: Thallium.

The concentration of thallium in the water column at a station in the North Atlantic has been investigated using a neutron activation procedure. Values ranging from 9.4 - 16.6 ng/liter were found. Thallium has been determined in 11 deep sea sediments. Experiments suggest that the geochemical balance of the element in the oceans may be maintained by adsorption on the hydrous manganese dioxide phase of ferro-manganese minerals and by incorporation into the lattice of illite and similar clay minerals. DISPERSION OF NATURALLY OCCURRING IONS IN GROUNDWATER FROM VARIOUS ROCK TYPES IN A PORTION OF THE SAN PEDRO RIVER BASIN, ARIZONA,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
D. E. Wallace, and L. R. Cooper.
Journal of Hydrology, Vol 10, No 4, p 391-405, June 1970. 15 p, 9 fig, 1 tab, 7 ref.

Descriptors: *Groundwater movement, *Water chemistry, *Dispersion, *Tracers, *Arizona, Solutes, Alluvium, Recharge, Discharge (Water), Flow nets, Leaching, Mixing, Ion transport, Ions.
Identifiers: San Pedro River basin (Ariz).

The groundwater in an alluvial basin in southern Arizona was analyzed for concentrations of Ca, Mg, Na, and Cl ions. The variety of rock types in the area, plus the undisturbed state of the groundwater basin, make comparative rock mineralization-groundwater ionization interpretations possible. Ionic dispersion in groundwater emanating from source areas composed of differing rock types is plotted as isogram maps. These isolated areas of differing mineral composition each exhibit a unique ionic contribution to groundwater. The ion concentrations in groundwater were then used as naturally occurring tracers to determine source areas of recharge and to delineate subsurface barriers to the normal basin flow net. Ion dispersion plots reveal the carbonates of the Dragoon Mountains to be a major contributor of Ca and Mg to the deep alluvial portion of the basin. Cl dispersion patterns show the granitic intrusives of the Tombstone Hills produce a barrier effect in the normal flow pattern of the basin as well as being a contributor of Cl to groundwater. CHROMIUM SPECIATION IN SEA WATER,
Leeds Univ. (England).
H. Elderfield.
Earth and Planetary Science Letters, Vol 9, No 1, p 10-16, August 1970. 7 p, 4 tab, 22 ref.

Descriptors: *Chromium, *Sea water, Water chemistry, Trace elements, Chemical reactions, Oxidation-reduction potential, Chemical precipitation, Sedimentation.
Identifiers: Chromium ions (Sea water).

Comparison of an equilibrium model for Cr in sea water (and in marine sediments) with the real system has revealed a significant discrepancy in that the predicted Cr (III) concentration in sea water is considerably less than that actually found. While chemical thermodynamics can qualitatively describe possible Cr species in sea water, other parameters are also involved in controlling the Cr oxidation ratio. The slow oxidation rate of Cr (III) is suggested as being a likely causal factor. The reduction of Cr (VI) by organisms and/or organic matter should also be nonlabile but an organic factor cannot be completely ruled out since the mechanism of concentration of Cr by marine animals is unknown. (Knapp-USGS)

STUDY ON SALT WATER INTRUSION INTO GROUND WATER - PART 2. GEOCHEMICAL RESEARCH OF SALT GROUNDWATER (JAPANESE).
Industrial Science and Technology Agency, Kawasaki (Japan). Geological Survey.
Kiyoji Ikeda.
Bulletin of Geological Survey of Japan, Vol 18, No 6, p 15 (393)-33 (411), June 1967. 19 p, 17 fig, 13 tab, 8 ref.

Descriptors: *Geochemistry, *Saline water intrusion, Groundwater, Aquifers, Ion exchange, Clay minerals, Leaching, Groundwater movement, Water chemistry, Path of Pollutants.
Identifiers: Japan, Fuji.

The Cl contents of coastal groundwater in Fuji city, Shizuoka prefecture, Japan have increased rapidly since 1960. The salt groundwater is mainly in the Fuji lava, and the salt-water zone has been widened rapidly. The chemical components of the salt groundwater are generally characterized as noncarbonate hardness type, and differ from those of sea water at the early stage of salting. Groundwater has: (1) higher Ca content; (2) slightly higher SO4 content; and (3) lower Na, K and HCO3 contents than the chemical components of sea water and groundwater proportionally mixed. Experimental results suggest that the change of chemical compositions at the early stage of salting is due to base-exchange and dissolution reaction between sea water and clay in the water-bearing layers. entifiers: Isotopic fractionation (Water).

he isotopic composition of groundwaters differs om that of the average rain composition due to lection (seasonal or otherwise) from among difrent rainfalls during the replenishment of groundaters, as well as to isotope fractionation in some f the steps in the recharge process. An assessment f the resulting concentration changes is required efore the characteristic variations of the isotopic omposition of atmospheric waters can be used as ydrological tracers of groundwaters. An over-all easure of the fractionation effect is obtained by omparison of the isotopic composition of rain and roundwaters in regions in Israel of known ydrological pattern and recharge areas. Correlaon of the effects with the areal environmental facors gives preliminary clues to the causes of fraconation. Of these the formation of puddles after ain seems particularly effective. Water-transport rocesses, which are steps in the rain-to-groundater transition, are evaluated regarding their otential contribution to the modification of the sotopic composition. They include interception by egetation, open-water evaporation and exchange ith ambient vapor from overland flow and surface unoff, evaporation of soil moisture, transpiration, nd water transport by unsaturated flow in the zone f aeration. PHOTOSYNTHESIS AND ZONATION OF FRESHWATER MACROPHYTES,
Saint Andrews Univ. (Scotland). Dept. of Botany.
D. H. N. Spence, and Jean Chrystal.
New Phytologist, Vol 69, No 1, p 217-227, 1970. 2 fig, 30 ref.

Descriptors: *Photosynthesis, *Fresh water, Sun, Depth, Oxygen, Productivity, Light intensity, Chlorophyll, Energy, Carbon dioxide, Respiration, Mathematical models.
Identifiers: *Macrophytes, Shade, Potamogeton polygonifolius, Potamogeton obtusifolius, Leaf area, Leaf thickness.

The photosynthetic response of leaves produced in a glasshouse under both sun and shade conditions, from two species rooted in different depths of water is compared. There are significant, inherent differences in morphological and photosynthetic responses to light of 'sun' species of Potamogeton obtusifolius leaves (mean water depth 130 centimeters) and Potamogeton polygonifolius 'shade' species (mean depth 9 centimeters). Potamogeton obtusifolius has a rather similar photochemical capacity to P polygonifolius but has a lower energy yield value. It is concluded that a higher net photosynthetic capacity of this shade species in low irradiance such as 1% daylight must be achieved by reduction in respiration rate per unit area and leaf thickness, and increases in specific leaf area. Perhaps lowered respiration rate is partially a consequence of reduction in leaf weight/unit area and in ratio of non-assimilatory to assimilatory tissue; these factors may balance reduced light absorption by the thinner leaf. It is suggested that the limitation of net photosynthesis in shade species at levels of irradiance in which sun species are not limited, is related in a species like Potamogeton obtusifolius to its inability to reduce specific leaf area, thicken leaves and thus increase its capacity to absorb light. (Jones-Wisconsin)

PHOSPHORUS REQUIREMENTS OF TWO PLANKTONIC DIATOMS IN STEADY STATE CULTURE,
North Carolina State Univ., Raleigh. Dept. of Zoology.
Edward J. Carpenter.
Journal of Phycology, Vol 6, p 28-30, 1970. 1 fig, 1 tab, 12 ref.

Descriptors: *Phosphorus, *Nutrient requirements, *Plankton, *Diatoms, *Cultures, Temperature, Light intensity, Hydrogen ion concentration, Carbon dioxide, Laboratory tests.
Identifiers: *Steady state, Cylindrotheca closterium, Nitzschia, Cyclotella nana, Chemostat.

Investigations on algal phosphorus requirements were carried out in batch culture systems in which conditions existing in nature are not approached due to unnatural increases in algal metabolites, changes in pH and carbon dioxide concentration, and lack of fresh nutrient input. The chemostat, a continuous-flow open system, can eliminate or reduce some of these limitations because new medium is continually introduced to the culture vessel and a suspension of algae and new and old media continually exists. Application of the chemostat is described in determining the limiting phosphorus requirements, at one growth rate, of two planktonic marine diatoms. Minimum phosphorus requirements of Cylindrotheca (Nitzschia) closterium and Cyclotella nana, were measured in axenic steady state chemostat culture. C closterium and C nana required 1.055 and 1.045 temto gramatoms phosphorus/cell per generation of 0.20 divisions/day. Algae were cultured at 15.5C and exposed to 5380 lux on a light-dark cycle of 19 and 5 hours. Phosphorus requirement/unit of cell volume was 0.0135 and 0.0129 temto gram-atoms phosphorus per cubic micron of cell volume for C closterium and C nana, respectively. (Jones-Wisconsin)

TRANSFORMATION OF RIVER WATER AT THE MOUTH OF A RIVER AND SOME CRITERIA OF POLLUTION,
State Oceanographic Inst., Moscow (USSR).
A. Simonov.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 4 p.

Descriptors: *Water pollution, *Rivers, Sewage disposal, Sewage treatment, Mathematical model, Salinity, Flows, Currents (Water).
Identifiers: *Criteria, *Marine discharge.

Results are given for theoretical and experimental hydrological-hydrochemical investigations of the transformation of river water into sea water at the mouth of several rivers of the U.S.S.R. The studies are concerned with the main features of exchange mechanism of physical and chemical characteristics at the dividing zone of the river and sea water at the mouth where there are no marked tidal phenomena. The current velocity any distance from the river, at the mouth, depends on the velocity of the river mouth, on the depth and on a parameter taking into account the actual physical and chemical exchange conditions. Decreasing current velocity of the flow is characterized by the satisfaction of a negative exponent. The equation of the water discharge for flow currents over the increasing depths obeys the exponential law and depends on the water discharge in the river mouth, on the depth and on the exchange conditions in the dividing area. The equations of water discharge and velocity of flow current are the main equations for estimating the distribution of other hydrological and hydrochemical characteristics of the mouth. The flow current water salinity with little wind increases sharply at the beginning of mixing then its rate of increase gradually decreases at some distance from the lower cross section of the river. Equations are derived for estimating a mean concentration of the main salt components and artificial admixtures. (Hancuff-Texas)

THE MATHEMATICAL MODELING OF A STRATIFIED ESTUARY,
Imperial Chemical Industries Ltd., Billingham (England). Heavy Organic Chemical Div.
G. D. Hobbs.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 6 p, 15 ref.

Descriptors: *Density stratification, *Mathematical models, *Estuaries, *Water quality, Saline-water-Freshwater interfaces, Mass transfer, Mixing, Tidal effects, Rivers, Hydrodynamic, Water chemistry, Diffusion.
Identifiers: Radioactive tracers.

The application was investigated of one- and two-dimensional mathematical models to the prediction of water quality in the estuary of the River Tees, a partially-mixed estuary suffering pollution from industrial waste water and domestic sewage. The one-dimensional model implied that all quantities of interest can be regarded as varying only with position along the river. This type of description is of most value for shallow freshwater streams and estuaries of the well-mixed type. The two dimensions under consideration were length and depth. A two-dimensional description will be of most value for partially stratified estuaries in which quantities varying significantly but smoothly over the depth. The relation of this work to the development of a complete model, incorporating both the hydrodynamics and the biochemistry, and verified against field data is briefly discussed. (Hsieh-Vanderbilt)

WATER-CLAY INTERACTIONS IN NORTH CAROLINA'S PAMLICO ESTUARY,
North Carolina Univ., Chapel Hill. Dept. of Geology; and North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
David A. Dobbins, Paul C. Ragland, and J. Donald Johnson.

Environmental Science and Technology, Vol 4, No 9, p 743-748, September 1970. 6 p, 6 fig, 5 tab, 22 ref.

Descriptors: *Estuaries, *Water chemistry, *Clay minerals, *North Carolina, Ion exchange, Cation adsorption, Saline water systems, Mixing, Saline water-freshwater interfaces, Connate water, Bottom sediments.
Identifiers: Pamlico Estuary (N C).

A natural estuarine environment was examined to show the chemical relationship between various waters and sediments. The pore to bottom water ratio of cationic equivalents measured at 20 stations increases systematically downstream from about 0.6 to 1.2 along the 50-mile profile in North Carolina's Pamlico River estuary. This trend is apparently controlled by entrapment of relatively saline water after northeasterly storms as the suspended load settles. Cationic concentrations generally decrease in the pore waters with depth, from a maximum 10-20 cm beneath the sediment-water interface. An increase of K equivalent ionic fraction in the pore waters with depth may be related to H ion exchange with the sediments. A strong correlation between exchangeable Mg and chlorite, as well as exchangeable K and illite, was noted. The ionic data are related to changes in the natural system and not to contamination by municipal wastes. (Knapp-USGS)

HYDRODYNAMIC MODEL OF THE BLAKE OUTER RIDGE,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
George M. Bryan.
Journal of Geophysical Research, Vol 75, No 24, p 4530-4537, August 20, 1970. 8 p, 9 fig, 16 ref. Naval Ships Systems Command Contracts NO bsr 85077 and N00024-67-C-1186.

Descriptors: *Sedimentation, *Continental shelf, *Florida, *Continental slope, *Marine geology, Oceans, Atlantic Ocean, Ocean currents, Currents (Water), Computer models, Model studies, Mathematical models, Topography, Deposition (Sediments), Hydrodynamics.
Identifiers: Blake Plateau, Blake Outer Ridge.

Formation of the Blake outer ridge by differential deposition of sediment on a relatively flat-lying floor (horizon A) is discussed on the basis of the hydrodynamic interaction of two oppositely directed currents, which are decelerated in the interaction zone and diverted to a final direction taken to be the trend of the Blake outer ridge. If one or both of the currents carry sediment, deposition occurs preferentially in the region of decelerated flow, so that sediment distribution is governed by the steady-state velocity field. Streamlines and isotachs computed from a model of two-dimensional streamline flow are found to be consistent with the known sediment distribution; they require upstream current widths in substantial agreement with estimated widths of the Florida Current and the Western Boundary Undercurrent. The Florida Current contributes relatively coarse sediment; the undercurrent, very fine sediment. (Knapp-USGS)

CALCULATION OF COASTAL ENERGY AND DRIFT RATE,
Florida State Univ., Tallahassee. Dept. of Geology.
William F. Tanner.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 2-Seminar Communications), Paper S34, p 313-317, 1967. 5 p, 3 ref.

Descriptors: *Beaches, *Waves (Water), *Beach erosion, *Littoral drift, Ocean currents, Mathematical studies, Sediment transport, Shore protection.
Identifiers: *Spits.

An exponential equation is developed, relating shelf slope to wave energy. Wave energy is taken as the dependent variable. The coefficient on the exponent, and the initial conditions, are obtained from published data. The fit, for certain coasts in the southeastern United States (where convergence-divergence problems are not serious) is good. Depletion-accumulation rates are converted, on the basis of a study of a spit of apparently known dimensions and age, into work figures; this study is then compared with field data from two other, similar, spits. The distance term necessary to make the conversion appears to be about 5 kilometers, for an inferred history of 4,000 years. An impulse determination yields about the same results. For the areas studied, available wave energy is about 1 million times the energy spent in unidirectional littoral sediment transport. (Knapp-USGS)

Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 2-Seminar Communications), Paper S32, p 300-306, 1967. 7 p, 6 fig, 3 ref.

Descriptors: *Beaches, *Waves (Water), *Data processing, *Computer programs, Erosion, Engineering, Beach erosion, Statistics, Data collections, Shore protection.
Identifiers: France, Wave energy.

An accurate knowledge of local wave conditions is prerequisite to successful coastal engineering design. This article is a brief description of the various computer calculations employed by the Laboratoire National d'Hydraulique, France, to process wave recorder data. The first of these programs provides a statistical analysis of the raw data. The second program analyzes the variation of the characteristic values as functions of time and predicts the characteristics of the centenary and millenary waves. The third calculation permits a study of inshore conditions by means of wave refraction diagrams. (Knapp-USGS)

HYDRAULIC MODEL EXPERIMENT ON THE DIFFUSION DUE TO THE TIDAL CURRENT,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Haruo Higuchi.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D9, p 79-88, 1967. 10 p, 14 fig, 3 ref.

Descriptors: *Estuaries, *Diffusion, *Tidal effects, *Currents (Water), Mixing, Model studies, Dye releases, Tracers, Hydraulic models, Hydraulic similitude, Dispersion, Path of pollutants, Waste water disposal.
Identifiers: Japan.

The diffusion phenomena due to tidal currents in the shallow broad estuaries were studied in a hydraulic model experiment for which Ariake Bay in the Amuta area of Kyushu was used as the prototype. Only the tidal current is taken into account. A model of the northern half of Ariake Bay, of which the length is about 90 km, with a horizontal and vertical scale of 1/2000 and 1/200 respectively, was constructed, and a semidiurnal tide was generated by an automatically controlled pneumatic tide generator. The water levels at 5 stations, the current ellipses at 4 stations, and the flow pattern were measured and compared with those in the prototype. Diffusion from an instantaneous point source and from a continuous point source was investigated mainly by a photographic method. Experiments show that tides and tidal currents are accurately reproduced in the model. The diffusion coefficient evaluated through mixing of the water from Chikugo River with sea water is almost the same as in the prototype. However, the diffusion coefficient evaluated through the rate of increase of the dye patch is about 1/3 of that in the prototype. This may be due to the difference between the flow in the model and that in the prototype. (Knapp-USGS)

QUANTITATIVE MEASUREMENT OF MARITIME SEDIMENT MOVEMENT USING RADIOACTIVE TRACERS (RUSSIAN),
Polish Academy of Sciences, Gdansk. Inst. of Hydraulic Research.
E. Makowski, and G. Grissener.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/12, p 181-190, 1967. 10 p, 3 fig, 1 tab, 4 ref.

Descriptors: *Sediment transport, *Bottom sediments, *Beaches, *Tracers, *Tracking techniques, Radioisotopes, Radioactivity techniques, Bed load, Littoral drift, Erosion, Sedimentology, Marine geology.
Identifiers: Marine sediments.

The quantitative method of marine sediment tracing involves burying appropriate detectors under the sea bottom. Detectors arranged in this way are covered by a layer of radioactive sediment whose activity is proportional to its mass. Before the labelled sediments are eroded, their initial activity is measured, and then, as the covering is eroded,

easurements are made of the gradual decrease in tivity corresponding to loss of the surface layer of e bottom deposit area under investigation. The acers used in the investigations discussed were tural ones such as Si-31 and artificial ones such activated fragments of sodium glass with Na-24. he proportional dependence of activity on mass s been confirmed for both tracers. This proporonality is very well maintained if a sample of ghly active sediment is introduced into a large ass of inactive sediments. The advantages of this ethod as a possible use of radioisotopes with a ort half-life and a low total activity of the order of few millcuries are discussed. (See also W70-9868) (Knapp-USGS)

NEW SYNTHETIC MEMBRANES FOR REVERSE OSMOSIS DESALINATION,
Arthur D. Little Research Inst., Inveresk (Scotand).
G. Maconochie, and G. Thomson.
Available for sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $0.65. US Office Saline Water Research and Development Progress Report No 533, June 1970. 64 p, 5 fig, 3 tab, 14 ref. OSW Contract No 14-01-0001-1716.

Descriptors: *Membranes, *Reverse osmosis, Permselective membranes, Semipermeable membranes, Laboratory tests, Thin films, Plastics, Research and development, Membrane processes, Permeability.
Identifiers: Synthetic membranes.

The fabrication and reverse osmosis testing of films made from a number of copolymers derived from galactose methacrylate, glyceryl methacrylate, vinyl carbazole and methyl methacrylate are reported and discussed. Synthesis of these materials is described explicitly. By addition of a 'swelling agent' to the solvent mixture, and immersion before completion of drying, 'Loeb type' heterogeneous films were cast. The effects of after-treatment of films were also investigated, consisting of heating at various temperatures in water, and of immersion in aqueous ethanol. A limiting factor in flow performance is the minimum film thickness attainable and thin homogeneous films were prepared by two alternative methods. Lack of toughness in thin sections seemed a possible reason for the difficulty in obtaining very thin films. A quantity of higher molecular weight galactose methacrylate copolymer was prepared. (Knapp-USGS)

AGRICULTURAL IRRIGATION AND SALINE QUALITY OF WATER.

Land and Water Law Review, Vol. 5, p 491-499 (1970). 9 p, 38 ref.

Descriptors: *Irrigation water, *Salinity, *Impaired water quality, *Leaching, Water utilization, Saline water, Irrigation, Water supply, Water demand, Water pollution, Irrigation effects, Water quality control, Legislation, Programs, Administrative agencies, Standards, Salt balance, Soil water, Water pollution sources, Irrigation practices, Pollution abatement, Adoption of practices, Legal aspects, Costs.

Salinity--the concentration of dissolved salts in water--is a major water pollution problem in the West. The main cause of this salinity is leaching of minerals from irrigated land. Much legislation has been enacted to abate pollution, many of which promulgate minimum standards of water quality. These standards, however, often do not provide for control of the major source of salinity--agricultural irrigation. Some states do have legislation which could be interpreted to cover irrigation practices. However, the importance of irrigation to many western states' economy militates against any strong action against present irrigation practices by these states. Improved methods of irrigation, such as use of a machine which would allow only enough water to reach plant roots, with no excess to leach the soil, are beyond the economic resources of most irrigators. While little action is now likely against irrigators who presently cannot afford new irrigation techniques, the increasing magnitude of the problem will eventually force changes in these practices. WEATHER MODIFICATION POTENTIAL FOR WATER SUPPLY IN THE COLORADO RIVER,
Bureau of Reclamation, Denver, Colo.
Archie M. Kahan.
Paper, Second National Conference on Weather Modification, American Meteorological Society, Santa Barbara, Calif, Apr 1970. 43 p, 9 fig, 2 tab, 19 ref, append.

Descriptors: *Weather modification, Storms, Runoff, Nucleation, Silver iodide, Water resources, Runoff forecasting, *Cloud seeding, *Artificial precipitation, Planning, *Water supply, Atmospheric precipitation, Field investigations, Watersheds (Basins), Public opinion, Public relations, Education, Snowfall, Bibliographies.
Identifiers: Upper Colorado River Basin, Colorado River Pilot Project, San Juan Mountains, Colo.

Weather modification experiments suggest that present-day technology, using silver iodide as the nucleating material, can produce increases of over 200% in snowfall under ideal conditions. An average increase of about 30% seems to be a reasonable long-term expectation. It is estimated that by seeding storms during the winter months only, the 14,200-sq-mi water-producing area of the Upper Colorado River Basin could produce 1,870,000 acre-ft of additional streamflow annually. People problems have been encountered during initial pilot projects. However, as people become aware of the potential value of precipitation augmentation programs, the people problems may well diminish. Precipitation management can be helpful in meeting the growing water needs of the nation. (USBR)

ARIZONA WEATHER MODIFICATION RESEARCH PROGRAM,
Meteorology Research, Inc., Altadena, Calif.
Paul B. MacCready, Jr.
Proceedings of the American Society of Civil Engineers, Journal of Irrigation Drainage Division, Vol 96, No IR2, p 103-110, June 1970. 8 p, 3 fig, 7 ref, append.

Descriptors: *Weather modification, *Cloud seeding, Silver iodide, Atmospheric precipitation, Glaciation, Supercooling, Cumulus clouds, Cloud physics, Radar, Ice, Instrumentation, Aircraft, Nucleation, Field tests, Water resources, Research and development, *Rainfall, Runoff, Meteorology.
Identifiers: *Cloud modification, Skywater Project, Flagstaff (Ariz), Supercooled clouds, Pyrotechnic seeding, Convective clouds.

An interim progress review for the period ending with the fourth summer season at Flagstaff, Ariz, is presented. In 1967, randomized seeding of isolated cumulus clouds was the main experiment. A simple computer model served successfully for test cloud selection and evaluation of results. The experiment demonstrated statistically significant cloud-top height increases (averaging 6000 ft) and approximate doubling of precipitation. Cloud interiors

were probed with an instrumented aircraft. In contrast to events in unseeded clouds, observations of seeded cumuli showed rapid spread of glaciation throughout the clouds. Subsequently, additional buoyancy and organization of the upcurrent, and early shutting off of precipitation growth were noticed. The study in 1967 involved exploratory trials of seeding larger storm systems to organize and stimulate them. In 1968, a program called COOP II brought together the capabilities of several groups to continue the studies, with special emphasis on storm systems and optimizing seeding techniques. (USBR)

ANNUAL AND PERENNIAL BARRIERS IN RELATION TO WIND EROSION AND MOISTURE CONSERVATION,
Agricultural Research Service, Sidney, Mont.
F. H. Siddoway.
Presented at Conservation Tillage Workshop conducted by the Great Plains Agricultural Council, Lincoln, Nebraska, February 27-29, 1968. 21 p, 6 fig, 1 tab, 19 ref.

Descriptors: *Barriers, *Windbreaks, *Great Plains, *Wind erosion, *Water conservation, Precipitation (Atmospheric), Fallowing, Evaporation, Snow, Agriculture, Crop production, Microclimatology.
Identifiers: *Plant-microclimate relationships.

Barriers, whether mechanical or vegetative, invariably alter the microclimate in their vicinity. This results from a combination of factors coinciding with the universal effect of reducing windspeed to the leeward and windward of the barrier. In the Great Plains the primary purposes of the barriers are: (1) Wind erosion control (2) Evaporation reduction (3) Managing snow deposition (4) Crop protection against adverse physical effects of winds. The literature indicates that practically all microclimatological barrier influences in the Great Plains are favorable to plant growth. An equation has been developed, on the basis of the reduced wind speed effect which facilitates the design of predictable barrier erosion control systems. Much evidence indicates maximal water conservation from snow precipitation in the first spring after a crop harvest. This may eliminate the necessity of summer fallowing and consequently reduce wind erosion problems. The resulting annual cropping would offset the disadvantages of land occupancy by the barriers. The major need would be for adequate barrier-spacing design. (Casey-Arizona)
W70-09957

BARRIERS FOR MOISTURE CONSERVATION AND WIND EROSION CONTROL IN THE GREAT PLAINS,
Agricultural Research Service, Sidney, Mont.
F. H. Siddoway.
Presented at the 24th Annual Meeting Soil Conservation Society of America, Colorado State University, Fort Collins, Colorado, August 10-13, 1969. 21 p, 2 fig, 2 tab, 20 ref.

Descriptors: *Barriers, *Windbreaks, *Water conservation, *Great Plains, Semiarid climates, Agriculture, Snowfall.
Identifiers: *Vegetative barriers, *Barrier engineering.

Modifications of windspeed and flow patterns are the primary microclimatic effects of barriers. Reduction of windspeed varies with height multiples of the barrier, distance from the barrier, physical properties of the barrier and wind and ground surface properties. Historically, field barriers in the Great Plains were multiple rows of trees or shrubs. However, these dense barrier belts occupied large amounts of arable land and piled up deep snowdrifts creating water erosion and delaying spring planting. More recently short, single-row, narrowly spaced, barriers have been utilized with better results, particularly in creating more uniform field snow drift distribution under variable wind drift directions. The drier parts of the Great Plains have the most to gain from barrier plantings, but have not yet intensively used them. This is probably because of the rarity of suitable tree species, the expense, difficulty, and long time required for their establishment and their subsequent competition with crop plants. It is suggested that non-tree plant materials be used-shrubs, sorghum, grass, corn. (Casey-Arizona)

In Ecological Effects of Weather Modification: A Problem Analysis, Chapter 3, p 22-33, School of Natural Resources, University of Michigan, May 1969. 26 ref. Bureau of Reclamation, Office of Atmospheric Water Resources, Contract Number 14-06-D-6576.

Descriptors: *Weather modifications, *Ecology, *Habitats, *Semiarid climates, *Precipitation (Atmospheric), Ecosystems, Arid lands, Streambeds, Stream erosion, Vegetation, Wildlife, Animal behavior, Grasslands, Grazing, Ecotypes, Potholes, Cloudseeding, Streamflow, Sedimentation.
Identifiers: *Vegetation mosaics, *Plant succession.

Weather modifications in semiarid and arid areas will be aimed toward increasing precipitation in agricultural and municipal areas and increasing mountain snowfall to augmentdownstream runoff. The effects of these precipitation changes on various ecosystems involved are examined. The species diversities of natural grasslands are remarkably stable as shown by responses to the drought of the 1930's and to artificial precipitation experiments. The dominant species composition varies over time and space with rainfall according to natural vegetational mosaic self-regulating mechanisms, which may also be influenced by grazing intensity and selectivity. Mammalian populations will respond to weather modifications as complex functions of vegetational changes. A crucial point is that weather modification involving cloud seeding is unlikely to alleviate severe droughts since they are associated with air patterns which inhibit cloud formation. The 10-14 inch average annual rainfall range is critical to stream beds since variations on either side of it will effect changes in runoff flow and sediment yield altering stream channel characteristics. INFERENCES FROM ECOLOGICAL THEORY,
Michigan Univ., Ann Arbor. Dept. of Resource Planning and Conservation.
Charles F. Cooper, and William C. Jolly.
In Ecological Effects of Weather Modification: A Problem Analysis, Chapter 10, p 109-122, School of Natural Resources, University of Michigan, May 1969. 24 ref. Bureau of Reclamation, Office of Atmospheric Water Resources, Contract Number 14-06-D-6576.

Descriptors: *Ecosystems, *Weather modification, *Habitats, *Precipitation (Atmospheric), *Ecology, Humid areas, Semiarid climates, Arid lands, Soil-water-plant relationships, Competition, Plant populations, Climatology.
Identifiers: *Plant communities, *Marginal habitats, *Climatic variability effects, Genetic resources, Extinctions.

An attempt is made to assess the ecological impacts of weather modification purely on the basis of existing fragmentary ecological theory. Plant species are composed of continuous populations normally distributed between environmental extremes and associated with other plants in communities. A change in rainfall may change a community by expediting the invasion of a new species with differing moisture requirements by eliminating an older species, or by changing abundances of species already present. The argument that weather modification will have no biological effects because it will be entirely within present climatic variability ranges is considered fallacious, because the community, and especially its marginal elements will be affected by changes in mean rainfall over time. Different communities differ in their sensitivity to climatic changes. A fixed proportional change in precipitation will affect humid area plants the least, arid area plants more and semiarid plants the most. Stable climax communities and highly disturbed situations will be least affected. It is theorized that those plant groups least affected will be living in microclimates less variable than regional macroclimates. Animal extinctions are considered unlikely but valuable plant genetic resources may be lost as a result of increasing agricultural homogeneity. (See also W70-00140) (Casey-Arizona)

PHYSIOLOGIC COSTS OF SURVIVAL IN THE DESERT,
Aeromedical Research Lab., Holloman AFB, N. Mex.
W. C. Kaufman.
In: Physiological Systems in Semiarid Environments, Hoff, C. C. and Riedesel, M. L. (editors), p 177-185, University of New Mexico Press, 1969. 4 fig, 1 tab, 7 ref.

Descriptors: *New Mexico, *Solar stills, *Arid lands, *Water conservation.
Identifiers: *Chihuahuan Desert, *Physiologic costs, *Survival techniques.

The solar still requires expenditures of energy and body water in digging for proper placement. The physiologic costs of operation were compared to the return from the still in simulated desert survival conditions in New Mexico. Heat production and energy losses were measured in 5 human subjects using survival tools at 30 degree centigrade daytime temperatures and 25 degree centigrade nighttime temperatures. Additionally, solar still production was measured and compared with soil moisture content. With soil moisture content about 30 percent, results showed a return of only 0.1 liter in the first 24 hours whether digging was done a day or night. It was concluded that standard desert precautions involving avoidance of heat stress are better survival techniques than solar still operation. (Casey-Arizona)

3C. Use of Water of Impaired Quality

BENEFICIAL USE OF WASTE HEAT IN AGRICULTURE,
Oregon State Univ., Corvallis. Dept. of Soils.
Larry L. Boersma.
Fifth Annual Water Resources Research Conference, Feb 3-4, 1970, Washington, D.C., U. S. Dept. of Interior, Office of Water Resources Research, June 1970, p 65-73. 7 fig, 2 tab.

Descriptors: *Cooling water, *Nuclear power plants, *Beneficial use, *Thermal Pollution, *Agriculture, Soil temperature, Crop production, Crop response, Plants growth, Farms, Root development.
Identifiers: *Subsurface heat application.

Heat may stimulate as well as harm growth and development of plants. In geographical regions where soil temperature can limit growth, artificial soil warming becomes attractive. Nuclear reactor cooling water may be expected to have a temperature range of 90 to 100 degrees. A sub-surface application of the heat by circulating the warm water through a network of buried pipes was considered feasible. A field project was conducted. It emphasized evaluation of crop response to increased soil temperatures and a study of rate of heat loss growth rates and yields of tomatoes

strawberries, corn, alfalfa, bush beans, and lima beans growing on heated plots are measured and compared with identical plantings growing on unheated ground. The project has shown promise of success. The problems remained to be studied are: (1) a very dry core around the heat source which was particularly difficult to rewet, (2) thermal conductivity differed from soil to soil, (no system will apply universely), (3) the effect of heat application over a long period on soil. (Hsieh-Vanderbilt)

SALT TOLERANCE OF CROPS AT GERMINATION STAGE,
Udaipur Univ., (India). Agricultural Experiment Station.
G. L. Maliwal, and K. V. Paliwal.
Annals of Arid Zone, Vol 8, No 1, p 109-125, March 1969. 82 ref.

Descriptors: *Soil-water-plant relationships, *Saline soils, *Saline water, *Salt tolerance, *Germination, Irrigation practices, Irrigation water, Toxicity, Root zone, Arid lands, Semiarid climates, Anions, Cations, Sodium, Calcium, Magnesium, Potassium, Chlorides, Sulfates, Osmotic pressure, Alkalinity, Temperature, Soil moisture, Seed treatment, Cereal crops, Legumes, Rice, Cotton, Sugar beets.
Identifiers: *India, *Sodic soils, *Varietal differences, *Ion antagonism, Bajra, Maize, Jowar, Mung, Paddy.

In studying yields of crop plants under saline conditions, particular attention must be paid to germination since it is the crucial limiting factor. A saline substrate may affect germination in 2 possible ways: (1) Soil osmotic pressure build-up resulting in seed water imbalances (2) toxic effects of certain salts. In an effort to separate these effects the literature is reviewed with respect to relative salt tolerances of various crops, particularly legumes and cereal grains, and relative toxicities of differing salts and salt concentrations to differing plants and plant varieties. It appears that crop salt tolerances may vary from crop to crop, among varieties and from germination through different growth stages. Detrimental salinity effects increase at lower soil moisture levels and at higher soil temperatures. Presoaking of seeds in fresh water and leaching or preirrigation of saline soils are 2 methods whereby salinity effects on germination may be lessened. (Casey-Arizona)

FLOOD PLAIN INFORMATION, BRAZOS AND BOSQUE RIVERS, WACO, TEXAS.
Corps of Engineers, Fort Worth, Tex.

U S Army Corps of Engineers Flood Plain Report, May 1970. 39 p, 8 fig, 24 plate, 10 tab.

Descriptors: *Floods, *Flood damage, *Texas, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Brazos River (Tex), Waco (Tex), Bosque River (Tex), Standard project flood, Intermediate regional flood.

Flooding of the Brazos and Bosque Rivers, Waco, Texas is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. IMPROVED METHODS FOR PLANNING OF THERMAL DISCHARGES BEFORE SITE AQUISTION WITH A SPECIFIC CASE EXAMPLE ON THE COLUMBIA RIVER,
Battelle Memorial Inst., Richland, Wash.
R. T. Jaske, W. L. Templeton, J. R. Eliason, and J. C. Sonnichsen.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 12, 1970. Paper IAEA-SM-146/46. 32 p, 14 fig, 4 tab, 8 ref. Preprint.

Descriptors: *Computer models, *Thermal pollution, *Columbia River, Power plants, Mixing, Computer programs, Estuarine environment, Water temperatures, Nuclear powerplants, Feasibility studies, Velocity, Flow, Cross-sections, Dispersion, Effluents, Meteorological data, Advection, Grand Coulee Dam.
Identifiers: *COLHEAT, Isopleths.

The highly flexible computation system COL HEAT has been developed and extended for use in estimating interrelated physical effects in estuaries and rivers with highly transient flow conditions. This computer simulation model permits detailed planning of discharges in advance for single and multiple plant locations of overlapping complexity limited only by the accuracy of the input data base. Computer generated illustrations of concentration isopleths are included in the presentation; currently threshold limits of detectability of dye using this method are less than 0.05 ppb, for below visible limits. A special model which relates the hydraulic effects at the point of discharge to thermal tolerances in fish has been developed. The application of this method to a practical case problem was accomplished in work supporting a licence application for a direct cooled reactor plant at Columbia River Mile 78. The predictive needs of this site are very complex because of flow reversals. Based on extensive field data for determining modeling coefficients applicable to the river reach, and prediction of appropriate concentration gradients for the mixed effluent, siting feasibility was recommended. THE CHAMIZAL,
International Boundary and Water Commission, El Paso, Tex.
Joseph F. Friedkin.
In: Water Spectrum, Issues, Choices, Actions, Vol. 2, No. 2, p 25-32, (Summer) 1970. 14 photo.

Descriptors: *Rio Grande, *Boundary disputes, *Canal construction, *Governments, *Coordination, *Water management (Applied), Cost sharing, Engineering, Flood control, Avulsion, Area redevelopment, Texas, Mexico.
Identifiers: *International Boundary and Water Commission, *International Cooperation, El Paso (Texas), Juarez, Chihuahua.

On December 13, 1968, a river that had kept the U.S. and Mexico involved in diplomatic dispute for over 100 years, was rechanneled into a concrete-lined girdle that established a new border at the point where El Paso, Texas, meets Juarez, Chihuahua. The International Boundary and Water Commission, United States and Mexico, a group of international water resource managers and engineers, were responsible. The solution to the problem of the shifting Rio Grande involved two major steps: (1) diplomatic agreement on a permanent boundary, and (2) solutions to the technical and social problems resulting from the new boundary. These problems included encasement of the channnel in concrete; demarcation of the new boundary by topographic survey; construction of five new bridges; compensation and resettlement of dispossessed property owners; and the relocation and construction of new border facilities, railroad lines and interchange yards, and the Bureau of Reclamation's irrigation canal. A program of border improvement including cultural and recreational facilities was also initiated. Engineers and planners from both sections of the Commission worked together and the responsibility and costs of construction were shared equally. The Chamizal project is a monument to International cooperation. In addition the International Boundary and Water Commission is providing international flood control works for urban and irrigation developments along the border, optimum feasible storage, and conservation and regulation of the Rio Grande for utilization by the peoples of the two countries. (Marriott-Chicago)

OPERATION FORESIGHT: A VALUABLE PRECEDENT,
Corps of Engineers, North Carolina Div.
Robert M. Tarbox.
In: Water Spectrum, Issues, Choices, Actions, Vol. 1, No. 1, Summer 1969, p 19-26. 11 photo.

Descriptors: *Flood control, *Flood protection, *Flood forecasting, Flood proofing, Warning systems, Flood damage, Levees, Dikes, Damages, Communication, Dredging, Channel improvement.
Identifiers: *'Operation Foresight', Emergency preventive measures, U.S. Army Corps of Engineers.

An account of the activities prior to the actual start of the floods in the Spring of 1969, that led to the unprecedented use of funds on measures to prevent damages. During these operations, North Central Division, spent about $11.9 million which contributed to the prevention of about $106 million in flood damages, as well as inestimable amount of heatbreak and anguish. Under special directive from the President, Corps funds, personnel, equipment, supplies and other resources were made available for full-scale preventive measures. Under a program which the Office of Emergency Preparedness named 'Operation Foresight' the Corps was a principle agency representing the Federal Government. Endangered communities welcomed the offered assistance and provided rights of way, labor, and other community resources. Maximum cooperation was also provided by local, State and Federal agencies in the 26 states in the Snowmelt path. The program included estimations of flood volume, inspection of existing flood control structures, checking of known danger areas, establishment of emergency communications, distribution of literature, flood training, construction of emergency dikes and levees, deepening of channels, experimentation with new materials, and coordination of all involved agencies. (Marriott-Chicago)

URBAN RENEWAL ENGAGES A PARTNER,
Waterloo, Iowa.
Lloyd L. Turner.
Water Spectrum, Issues, Choices, Actions, Volum 1, Number 1, Summer 1969, p 3-9. 8 photo.

Descriptors: *Urban renewal, *Flood control, *Area redevelopment, Multiple purpose projects, City planning, Aesthetics, Recreation, Economics, Benefits, Indirect benefits, Land use, Dredging, Channeling, Zoning, Urbanization, Iowa.
Identifiers: Total planning approach, Waterloo (Iowa).

An abstract written by the Mayor of Waterloo, Iowa, describing that city's approach to two major problems--severe yearly flooding and a large area of slum and blight, the result of unplanned growth in the flood plain. In order to solve the problems of urban redevelopment and flood control, the Westfield-Virden Project was conceived which combined these two originally separate programs into one program. A little more than two miles of riverfront and 1,500 acres of land behind it are involved in the program which hopes to be a model commercial-industrial complex offering improved economy, aesthetic satisfaction and recreational opportunities as well as flood protection and control. Included in the project are plans for a levee serving double function as a highway; re-routing of Black Hawk Creek; rechanneling and clearing Cedar river, using the dredge material as landfill; installation of a new movable dam; clearing of blighted areas; and rezoning of land to allow for industrial expansion. Plans have also been made for use of a sanitary landfill as part of the redevelopment program. Benefits from the program are indirect as well as direct. The expansion of industry will open up some 15,000 new jobs and benefit the local economy by about 240 million a year. Waterloo demonstrates the advantages of a total planning approach and may set an example for future planning. (Marriott-Chicago)

BENTONITE SEALING METHODS COMPARED IN THE FIELD,
Bureau of Land Management, Prineville, Oreg; and Agricultural Research Service, Reno, Nev.
Myron B. Rollins, and Anthony S. Dylla.
Proceedings of the American Society of Civil Engineers, Journal of the Irrigation Drainage Division, Vol 96, No IR2, p 193 203, June 1970. 11 p, 8 tab, 8 ref, append.

Descriptors: *Bentonite, Methodology, Field tests, *Reservoirs, *Reservoir leakage, *Sealants, *Soil sealants, Blankets, Seepage, Sands, Protective coatings, Linings, Construction costs, Irrigation canals, Costs, Buried membranes, Clays.
Identifiers: *Small reservoirs, *Small impoundments, *Seepage control.

Twelve small reservoirs were constructed at each of 2 sites in western Nevada to test methods of sealing with bentonite. Utah bentonite was installed as the following types of seals: (1) waterborne-harrowed, (2) waterborne-over-a-gravel surface, (3) surface blanket, (4) buried blanket, and (5) buried membrane. The waterborne-harrowed seals were short lived. The waterborne seals on reservoirs with graveled surfaces were effective only slightly longer, becoming ineffective after the third season. The 4-in. surface blanket seals were more durable, their effectiveness lasting about 5 seasons. The buried blanket and buried membrane seals proved to be the best, retaining 60% effectiveness 6 yr after installation. Costs of bentonite sealing varied from $0.20 to $1.30/sq yd of soil surface, and are comparable with other methods of sealing, such as plastics. (USBR)

ARTIFICIAL RECHARGE OF SUBTERRANEAN AQUIFERS,
Akademiya Nauk SSSR, Moscow. Institut Geologii Rudnykh Mestorozhdenii, Petrografii, Mineralogii i Geokhimii.
G. Bogomolov, and Yu Bogomolov.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 879-884, 1968. 6 p, 1 fig, 31 ref.

Descriptors: *Artificial recharge, *Aquifers, *Hydrogeology, Water wells, Induced infiltration, Water management (Applied), Water resources development, Water Supply.

Based on the analysis of natural conditions, a characteristic of main hydrological parameters determining the suitability of some regions for artificial groundwater recharge at the expense of infiltration of atmospheric precipitation and waters of surface-stream flow is given. Data on optimal distances of infiltration zones from areas of location of water-catchment systems are reported for different types of rocks as well as the estimation of the efficiency of water-catchment systems. ARTIFICIAL RECHARGE FOR GROUNDWATER STORAGE IN THE UNSATURATED ZONE,
Food and Agricultural Organization of the United Nations, Rome (Italy).
R. P. Ambroggi.
French resume. In: Water in the Unsaturated Zone, Vol II, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 83, p 884-885, 1968. 2 p, 1 ref.

Descriptors: *Artificial recharge, *Aquifers, *Hydrogeology, Water wells, Induced infiltration, Water spreading, Water management (Applied), International Hydrological Decade, Water resources development, Water supply.
Identifiers: Research recommendations.

A brief review is given of the requirements of artificial recharge for groundwater storage. Some examples are given of the application of artificial recharge in the unsaturated zone. It is conducted that the International Hydrological Decade should provide an opportunity to further study of groundwater storage in the unsaturated zone by means of artificial recharge through spreading grounds. 5A. Identification of Pollutants

THE APPLICATION OF LASER IONIZATION MASS SPECTROMETRY TO THE IDENTIFICATION OF ORGANIC SALTS IN POLLUTED WATER,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
F. J. Vastola, and R. O. Mumma.
Available from NTIS as PB-193 797, $3.00 in paper copy, $0.65 in microfiche. Institute for Research on Land and Water Resources, Research Project Technical Completion Report, University Park, Pa., Aug 1969. 6 p, 1 tab, 2 fig, 1 append. Contract No 14-01-0001-1858. OWRR Project A-0190PA (1).

Descriptors: *Pollution abatement, *Pollutant identification, *Analytical techniques, *Detergents, *Ionization, Sulfates, Ions, Sulfonates, Organic compounds.
Identifiers: *Laser ionization, *Mass spectrometry, *Detergent residues, Organic salts, Organic sulfonates, Organic compounds.

Laser ionization mass spectrometry was demonstrated to be applicable for the analysis of organic salts typical of those salts found in polluted waters. Various methods of introducing the sample into the mass spectrometer were investigated. Procedures were developed for the analysis of microgram samples and compilation of spectra of sulfonates, thiosulfates, and sulfates was initiated. (See also W70-09523) (Sink-Penn State Univ)

ANALYSIS OF ORGANIC SALTS BY LASER IONIZATION,
Pennsylvania State Univ., University Park. Dept. of Materials Science.
F. J. Vastola, R. O. Mumma, and A. J. Pirone.
Organic Mass Spectrometry, Vol 3, p 101-104, 1970. 1 tab, 1 fig, 2 ref. OWRR Project A-019-PA.

Descriptors: *Pollution abatement, *Pollutant identification, *Analytical techniques, *Detergents, *Ionization, Sulfates, Ions, Sulfonates, Organic compounds.
Identifiers: *Laser ionization, *Mass spectrometry, *Detergent residues, Organic salts, Organic sulfonates, Organic compounds.

Alkali salts of 1-hexyl sulfonate were ionized by laser irradiation and the positive ions were analyzed by time-of-flight mass specrometry. The sodium, potassium, rubidium and cesium salts produce relatively simple spectra. The major organic ions observed are due to the salt plus a cation or the dimer plus a cation. No molecular or fragment ions were detected. The instrumentation and the method of interpreting these data are described. (See also W70-09522)

POTOMAC RIVER WATER QUALITY NETWORK, COMPILATION OF DATA-WATER YEAR 1969.
Interstate Commission on the Potomac River Basin, Washington, D.C.
Interstate Commission on the Potomac River Basin Data Compilation Report, 1969. 92 p, 2 fig, 3 map.

Descriptors: *Data collections, *Water quality, Biochemical oxygen demand, Suspended load, Turbidity, Data storage and retrieval, Coliforms, Dissolved oxygen, Algae, Nutrients, Solutes, Chlorides, Calcium, Carbonates, Phosphates.
Identifiers: Potomac River basin.

Water quality data from the Potomac River basin are summarized. The water statistics are obtained from samples taken at 80 stream sampling points in the basin. The samples were taken and analyzed by agencies, industries and municipalities. An explanation of parameters is included. The data obtained this water year were stored in the Federal Water Pollution Control Administration computer-Storet. (Knapp-USGS)
W70-09557

CHLORINATED HYDROCARBONS IN MARINE ECOSYSTEMS,
California Univ., Berkeley. Inst. of Marine Resources.
R. W. Risebrough.
In: Chemical Fallout-CURRENT RESEARCH ON PERSISTENT PESTICIDES, Proceedings Publication of Rochester Univ. Conferences on Toxicity: Springfield, Ill, Charles C. Thomas Publisher, p 5-23, 1969. 19 p, 4 tab, 39 ref. NSF Grant GP 6362.

Descriptors: *Pesticide drift, *Pacific Ocean, *Pesticide residues, *Water pollution sources, *Chlorinated hydrocarbon pesticides, DDT, Dieldrin, Water pollution effects, Toxicity, Path of pollutants, Environmental effects, Ecology.
Identifiers: Chlorinated hydrocarbons.

Polychlorinated biphenyls, chlorinated hydrocarbons which are extensively used in industry and agriculture, are now widely distributed in marine ecosystems of the Pacific Ocean. Birds contain higher concentrations of these chemicals than fish; tissues of the peregrine flacon have contained the highest amounts which have so far been recorded. The polychlorinated biphenyls have not been detected in samples of airborne particulates but their observed distribution in the sea indicates that they are dispersed by wind currents and that their fallout pattern is similar to that of the DDT compounds. Their effects upon natural populations, including man, are as yet unknown. Among the chlorinated hydrocarbon 'pesticides', DDE is accumulating in significant amounts in marine food chains, and is also present in highest concentrations in marine birds, especially the procellariiform species. Its distribution indicates that coastal areas are not the primary sources of contamination. Wind transport can account for the observed distribution of DDT compounds in California waters. (See also W70-09559) (Knapp-USGS)
W70-09560

THE SIGNIFICANCE OF DDT RESIDUES IN ESTUARINE FAUNA,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Biological Lab.
P. A. Butler.
In: Chemical Fallout-Current Research on Persistent Pesticides, Proceedings Publication of Rochester Univ Conferences on Toxicity: Springfield, Ill, Charles C. Thomas Publisher, p 205-220, 1969. 16 p, 3 fig, 3 tab, 8 ref.

Descriptors: *Pesticide residues, *Persistence, *Estuarine environment, *Pesticide toxicity, *Environmental effects, DDT, Pesticide drift, Water pollution effects, Chlorinated hydrocarbon pesticides, Water pollution sources, Path of pollutants, Ecology, Aquatic environment, Estuaries.
Identifiers: Estuarine fauna.

A nationwide program was initiated in 1965 to monitor residues of ten synthetic, chlorinated hydrocarbon pesticides in estuarine populations of fish and shellfish. About 160 stations have been established where samples are collected at thirty-day intervals for analysis by gas chromatography with electron capture. The summarized data show that estuarine pollution levels reflect the intensity of agriculture in the associated river basin. Experiments were undertaken to determine effects of a DDT-contaminated diet on fish and crustaceans. There was essentially no correlation between the amount of DDT residue and the size of the animal or the length of time it fed on the contaminated food. The experimental and monitoring data indicate that existing widespread pesticide pollution is causing significant decreases in productivity of estuarine populations of fish and shellfish. Resistant surviving animals are instrumental in concentrating and transmitting lethal amounts of pesticide residues in the food web. (See also W70-09559) (Knapp-USGS)
W70-09564

COMPARISON OF THE WATER QUALITY OF THE BOIS BRULE AND POPLAR RIVERS, WISCONSIN - BOTH TRIBUTARY TO LAKE SUPERIOR,
Wisconsin State Univ., Superior. Center for Lake Superior Environmental Studies.
Donald A. Bahnick, Joseph W. Horton, and Ronald K. Roubal.
Available from the NTIS as PB-194 030, $3.00 in paper copy, $0.65 in microfiche. Center for Lake Superior Environmental Studies, Contribution No 16 (1970). 15 p, 4 fig, 4 ref. OWRR A-023-WISC (4).

Descriptors: *Water quality, Wisconsin, Color, Chemical oxygen demand, Rainfall, Nitrogen, Phosphorus, Hydrogen ion concentration, *Pollutant identification, Dissolved oxygen, Copper, Water chemistry, *Water analysis.
Identifiers: Bois Brule River, Poplar River, Specific conductance, Total solids.

A study of certain chemical parameters for the Poplar River, Wisconsin, Watershed is presented. Parameters determined were, nitrogen, phosphorus, copper, dissolved oxygen, chemical oxygen demand, specific conductance, color value, total solids, and pH. The collected data were correlated with rainfall and terrain in the drainage basin of the Popular River. These results were compared with a similar study of the Bois Brule River, a neighboring stream, which was studied in 1968. (See also W70-09675)

MERCURY IN THE MARINE ENVIRONMENT,
Scripps Institution of Oceanography, La Jolla, Calif.
David H. Klein, and Edward D. Goldberg.
Environmental Science and Technology, Vol 4, No 9, p 765-768, September 1970. 4 p, 3 fig, 1 tab, 17 ref.

Descriptors: *Water pollution sources, *Poisons, *Heavy metals, Chemical wastes, Sea water, Path of pollutants, Pollutant identification, California.
Identifiers: Mercury, Methyl mercury.

Mercury levels in marine sediment and three marine organisms--crab, whelk, and rock scallop--are 500 times or more greater than those in seawater of the California coastal environment of La Jolla and Palos Verdes. The subject of mass poisoning in aquatic life of recent note, mercury is released to the environment at an estimated rate of 4000-5000 tons annually. Higher values of mercury are found in sediments near sewer outfalls as compared to similar deposits further removed. The dispersion of this toxic pollutant by marine organisms and by man has already had serious consequences. (Knapp-USGS)
W70-09677

THE CHEMISTRY OF THE INTERSTITIAL WATER AS A MEASURE OF CONDITIONS IN A SANDY BEACH,
National Inst. for Water Research, Congella (South Africa).

W. D. Oliff, B. D. Gardner, W. D. Turner, and J. B. Sharp.
Water Research, Vol 4, No 2, p 179-188, February 1970. 10 p, 1 fig, 6 tab, 6 ref.

Descriptors: *Path of pollutants, *Biodegradation, *Beaches, Sands, Water pollution effects, Surf, Aeration, Dissolved oxygen, Oxygen demand, Sewage, Water pollution sources.
Identifiers: South Africa.

Interstitial waters of beaches were analyzed to determine the ability of the beach and surf zone to assimilate sewage. Water samples were drawn from about three below the surface of the beaches, about mid-way between low and high tide marks in the swash zone during low water of spring tides. The sea water samples were taken from the surf at the same place and time. Analyses were made for dissolved oxygen, salinity, pH, nitrite, ammoniacal and Kjeldahl nitrogen, and total phosphorus content. Two groups of experiments were performed. The first was done on a beach 20 mi. south of Durban, S. Africa, around a factory effluent outfall containing about 250 mg/liter of ammoniacal N. The second group covered three pairs of stations in the Durban area which were sampled at fortnightly intervals for 6 months. The first pair was at Brighton Beach, apparently a normal beach. The second pair was 100 yd from the Umgeni river mouth, under the influence of a moderate load of pollution. The last pair was 100 ft south of the mouth of the Umlaas River Canal which is highly polluted with industrial and domestic waste. The beaches, even those which were somewhat polluted, have all been apparently normal and aesthetically unobjectionable. The sea and the local beaches can accept greater loads of enriching material than encountered in these studies. (Knapp-USGS)

APPLICATIONS OF FLUORESCENCE SPECTROSCOPY TO FUNDAMENTAL PROBLEMS IN INSECT BIOCHEMISTRY,
Georgia Univ., Athens. Dept. of Entomology.
Chester M. Himel, and Richard T. Mayer.
Journal of Georgia Entomology Society, Vol 5, No 1, p 31-38, January 1970. 8 p, 2 fig, 1 tab, 21 ref. FWQA Grant 16020 EAO.

Descriptors: *Insecticides, *Biochemistry, *Enzymes, *Inhibitors, *Tracers, Analytical techniques, Metabolism, Pigments, Spectrophotometry, Spectroscopy, Fluorescence, Organic compounds, Insects, Animal physiology.
Identifiers: Fluorescence spectroscopy, Insect biochemistry.

Intrinsic fluorescence of enzymes which contain tryptophan can be used to study their conformation and dynamics. Fluorescent molecules can also be designed and synthesized that will bind (reversibly or irreversibly) with enzymes and other biopolymers. The fluorescence resulting here is referred to an extrinsic fluorescence. When the spectroscopic response (fluorescence excitation, emission and quantum yield) is a function of the environment of the bound fluorescent moiety, the fluorescent moiety is termed a fluorescent probe. Intrinsic and extrinsic fluorescent probes are discussed. Examples are given of designed, active-site-directed, reversible enzyme inhibitors which act as fluorescent probes. Such applications of fluorescence spectroscopy constitute a new and potentially very important methodology in insect biochemistry that is pertinent to our understanding of the mode of action of insecticides. ANALYSIS OF MULTICOMPONENT ORGANIC MIXTURES IN AQUEOUS MEDIA BY PYROLYSIS,
Rocketdyne, Canoga Park, Calif. Research Div.
Ihor Lysyj, Kurt H. Nelson, and Steve R. Webb.
Summaries in French and German. Water Research, Vol 4, No 2, p 157-163, February 1970. 7 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Pollutant identification, *Organic compounds, *Oily water, *Water pollution sources, *Chromatography, Analytical techniques, Gas chromatography, Mathematical studies, Waste identification.
Identifiers: Pyrolysis.

For general characterization of industrial and municipal wastes in waterways, a direct pyrographic approach is based on high temperature pyrolysis of the water sample followed by immediate gas chromatographic separation of the resulting organic fragments. The amounts of these separated fragments are then measured with a hydrogen flame ionization detector. Through mathematical treatment utilizing all pyrographic peaks, the recorded pyrogram can be interpreted in terms of concentrations of the original organic components. Application of the technique to solutions containing a total of 100 ppm glycerol, DL-valine, and hexanoic acid in various ratios gave a standard deviation of 1.7 ppm. The sensitivity of the technique is sufficient to detect oil pollution levels of less than 10 ppm. (Knapp-USGS)

WATER QUALITY SURVEY OF THE POTOMAC ESTUARY - 1965-1966,
Federal Water Pollution Control Administration, Annapolis, Md. Chesapeake Technical Support Lab.
Donald W. Lear, Jr., and James W. Marks.
Federal Water pollution Control Administration, Chesapeake Technical Support Lab, Data Report No 9, 1970. 71 p, 1 tab, 1 map.

Descriptors: *Water quality, *Sampling, *Data collections, Rivers, Water temperature, Turbidity, Suspended load, Dissolved oxygen, Biochemical oxygen demand, Organic matter, Nitrogen, Nitrates, Nitrites, Ammonia, Phosphorus, Chlorides, Chlorophyll.
Identifiers: Potomac River Estuary.

Water samples were collected in 1965 and 1966 to determine existing water quality of the Potomac estuary. Surface samples for chemical analysis were obtained by dipping a plastic bucket or large funnel into the river water with a minimum of agitation. Bottom samples were taken using a plastic Van Dorn sampler. Tabulated data include water temperature, turbidity, suspended solids, volatile solids, dissolved oxygen, biochemical oxygen demand, total carbon, total Kjeldahl nitrogen, organic nitrogen, ammonia, nitrate, nitrite, total phosphorus, inorganic phosphorus, chlorides, and chlorophyll a. (Knapp-USGS)

AN NMR STUDY OF THE PROTOLYSIS KINETICS OF SULFONAMIDES,
Georgia Univ., Athens. Dept. of Chemistry; and Georgia Univ., Athens. Dept. of Entomology.
J. F. Whidby, D. E. Leyden, C. M. Himel, and R. T. Mayer.
Georgia University Department of Entomology Research Support, 1970. 9 p, 4 fig. FWPCA Grant 16020-EAO.

Descriptors: *Biochemistry, *Tracers, *Organic compounds, *Nuclear magnetic resonance, *Sulfur compounds, Fluorescence, Ion exchange, Analytical techniques, Enzymes.
Identifiers: *Sulfonamides.

An NMR study was made of the protolysis of 5-dimethyl aminonaphthalene-1-sulfonic acid (DANS-acid) (I) and its N-methyl sulfonamide (II). Proton exchange studies on the 5-dimethyl amino group (5-DMA) of I and II were carried out in aqueous H_2SO_4 whereas proton exchange of the N-methyl sulfonamide moiety in II was carried out in aqueous 16.0 mole percent t-butanol. The pK of the 5-DMA moiety of I was determined to be 3.5 in 16% t-butanol by NMR and to be 4.52 + .03 in H_2O by spectrofluorescence measurements. RADIOISOTOPE TECHNIQUES DEVELOPED IN WATER-POLLUTION STUDIES,
Water Pollution Research Lab., Stevenage (England).
G. E. Eden, and R. Briggs.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/13, p 191-206, 1967. 16 p, 9 fig, 4 tab, 6 ref.

Descriptors: *Path of pollutants, *Tracers, *Tracking techniques, Radioisotopes, Radioactivity techniques, Sewage treatment, Dispersion, Monitoring, Instrumentation, Sediment transport, Bed load, Suspended load.
Identifiers: Water pollution tracers.

During the last 10 yr radioisotopes have been used in many aspects of water-pollution research to provide information which could not have been otherwise obtained. Instrumentation for tracing dispersal of sewage in the sea is discussed. The tracer bromide Br-82 is added continuously to the flow of sewage entering the sea through a submerged outfall, or alternatively as a single dose to the sea at the site of a hypothetical outfall. The dispersal is mapped by scanning the area with gamma scintillation counters towed at predetermined depths, continuously monitored by echo sounders. Double-labelling techniques are described. By use of a non-adsorbable tracer (for example bromide Br-82, or cobalticyanide Co-60 or Co-58) to label the liquid phase and a highly adsorbed tracer (for example Au-198 or Ag-110) to label the solid phase, it is possible to study segregation effects. The technique was used to demonstrate the short-circuiting of solids in a sludge-digestion system and to compare relative retention periods of dissolved and suspended matter in a percolating filter. By simultaneous addition of a non-adsorbed tracer and the radioisotope under investigation it is possible to detect reversible adsorption on the bed of a stream or on the walls of a sewer. Measurements of the ratio of the activities due to the two tracers at a point downstream provides an extremely sensitive method of detecting reversible adsorption; this procedure might well be of use in selecting tracers for the determination of flow in streams by tracer methods. THE NATURE OF AQUATIC POLLUTION,
State Univ. Coll., Fredonia, N.Y. Lake Erie Environmental Studies.
John A. Jones.
State University College, Fredonia, New York, Lake Erie Environmental Studies, Public Information Report No 2, 1970. 36 p, 23 fig.

Descriptors: *Water pollution sources, *Water pollution, *Water pollution effects, Pollutants, Coliforms, Toxicity, Nutrients, Suspended load, Nuclear wastes, Eutrophication, Sewage, Agriculture, Industrial wastes, Pesticides, Thermal pollution, Tertiary treatment, Detergents, Lake Erie, Bacteria, Viruses, Protozoa, Fungi, Worms, Radioisotopes, Salmonella, Shigella, Clostridium, Red tide, Mollusks, Trematodes, Chemicals, Copepods, Nematodes, Biochemical oxygen demand, DDT, Heavy metals, Nitrogen, Phosphorus, Powerplants, Cyanophyta, Wastes, Dredging.
Identifiers: Floating debris, Synergistic effects, Parasitic diseases, Classification of pollutants, Biological concentration, Petroleum industries, Parasitic worms, Biological pollutants, Chemical pollutants, Physical pollutants, Flow barriers, Shipping wastes, Boating wastes, Sublethal effects.

Water pollutants have been categorized as biological, chemical, and physical. The potential presence of most disease organisms may be detected by tests which determine the numbers of coliform bacteria. Chemical pollutants include substances exerting an oxygen demand, lethal and sublethal toxic substances, unpleasant non-toxic materials, and fertilizing nutrients. Presence and quantity of these pollutants are determined by chemical analyses, and their effects are generally readily evident in the environment. Physical pollutants include suspended sediments, floating debris, nuclear waste materials, and heat energy; these affect basic biological processes of organisms inhabiting natural waters or destroy the values of aquatic resources. Pollutants exert synergistic effects on aquatic organisms; thus, the presence of one pollutant increases the susceptibility of organisms to the other pollutants and environmental stresses. Chemical and physical pollutants appear to be the most problematical to the general environment; these include especially oxygen demand, eutrophication, toxic substances, and waste heat. The most hazardous pollution directly affecting the health of man are biological and chemical, including parasitic diseases and biologically accumulated toxic substances. Recovery and reuse of 'wastes' appears to be the only feasible solution to waste disposal in the long-term view. (Jones-Wisconsin)
W70-09906

TOXICITY EVALUATION OF A TECHNIQUE FOR INTRODUCING DIELDRIN INTO WATER,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
George G. Chadwick, and Ulo Kiigemagi.
Journal Water Pollution Control Federation, Vol. 40, No. 1, 1968, p 76-82. 2 fig, 2 tab, 2 ref. PHS Grant No. E5-00040.

Descriptors: *Evaluation, Bioassay, *Toxicity, Dieldrin, *Laboratory equipment, Gas chromatography, Pesticide residues, Pesticide toxicity, Solubility, *Solvation, Lethal limit, Reliability.
Identifiers: *HEOD, Guppies.

A system has been developed and tested for introducing dieldrin or other sparingly soluble compounds directly into water for experimental studies. Particles of sand in sand-packed glass columns were coated either with dieldrin or HEOD, and water was passed through the columns. Samples of the effluent water from the columns were tested for HEOD content by gas chromatography and for acute toxicity by bioassay with young guppies. Results of analysis of effluent samples by gas chromatography showed that the HEOD concentration remained relatively constant over a period of several months. Bioassay showed that the toxicity of effluents from columns coated with technical dieldrin was initially many times greater than the toxicity that could have been due to the HEOD present. The results of acute toxicity tests and gas chromatographic analysis of water samples indicate that the toxicity of dieldrin in water that has been in contact with dieldrin may not be predictable on the basis of chemical analysis for HEOD alone. The ratios of the concentration of HEOD to concentrations of other unidentified toxic components of dieldrin present in dieldrin-contaminated water can be highly variable. (Sjolseth-Washington)
W70-09971

5B. Sources of Pollution

ADSORPTION OF VIRUSES ON MINERAL SURFACES,
Maine Univ., Orono. Water Resources Research Center.
Otis J. Sproul.
Available from NTIS as PB-193 795, $3.00 in paper copy, $0.65 in microfiche. Project Completion Report, June 1970. 19 p, 5 tab, 6 fig, 2 ref. OWRR Project A-013-ME (3).

Descriptors: *Soil disposal fields, *Viruses, *Adsorption, *Bactiophage, Waste water treatment, Water pollution sources.
Identifiers: *Poliovirus, Minerals, Sillimonite, Enstatite, Wollastonite, Olivine, Kyanite, Microcline, Actinolite.

The specific aim was to determine the adsorption capacities of selected common minerals for viruses. Bench scale adsorption studies using T4 bacteriophage and the Type I poliovirus (Sabin Strain) and various silicate minerals have been carried out. The minerals used were sillimonite, enstatite, wollastonite, olivine, kyanite, microcline and actinolite. The size ranges for these minerals were restricted to between 1 and 10 microns in diameter. The adsorption of the bacteriophage T4 was related to the acidity of the silicate surfaces. A detailed study of the bacteriophage T4 and its adsorption on silicate minerals showed that the adsorption was related to the electrophoretic mobility. As the pH decreased the rate of virus adsorption increased at pH 4.3. There was a corresponding increase in slope in the mobility curve at this pH. At pH 3.3 the rate of virus adsorption decreased as the positive mobility declined. The adsorption of the bacteriophage T4 varied from about 50 to 99.5 percent for these minerals at pH values below 5. Slightly lower adsorption on the order of 50 to 80 percent was obtained in the adsorption of the poliovirus on the silicate minerals. These lower removals are partly attributed to the different type of virus which was used and also to the higher pH, A PH of 7.0, which was used in this work. A competitive effect on poliovirus adsorption was noted when extraneous organic materials were added either before or after the contact between the virus and the silicate material had occurred. Protein such as bovine albumin and egg albumin in concentrations of 1 and 1.5 mg/l were able to decrease the adsorption from 50 to 80 percent to as low as 12 to 20 percent. A domestic sewage secondary effluent decreased the adsorption of poliovirus by the same amount.

Report of Investigation 64, 1970. 28 p, 15 tab, 23 fig, 26 ref.

Descriptors: *Dissolved oxygen, *Nitrification, *Water quality control, Biochemical oxygen demand, Illinois, Oxygen sag, Reaeration, Rivers, Sanitary engineering, Time-of-travel, *Waste assimilative capacity, Water management, Water pollution sources, Water temperature.
Identifiers: Illinois River.

The La Grange navigation pool, a 77.4 mile reach of the Illinois River below Peoria, frequently experiences low dissolved oxygen concentrations which fall below 4.0 mg/l, the minimum standard. Weighted average DO concentrations as low as 1.65 mg/l, with a minimum DO of 0.9 mg/l, have been observed. Mathematical models were developed by statistical regression methods for predicting average and minimum pool DO concentrations. A variety of methodologies were investigated to determine the best procedure for defining the pool waste assimilative capacity; the Velz modification of the Black and Phelps procedure was selected. A quality control chart was designed to detect DO trends which deviate from expected patterns. The ability of the pool to assimilate organic wastes has been restricted because man has drastically altered the natural hydraulic and hydrologic characteristics of the river. A significant cause of DO depletion appears to be nitrification; this fact must be considered in future waste treatment requirements if significant water quality improvements are to be realized.

LEACHING FROM SIMULATED LANDFILLS,
Battelle Memorial Inst., Columbus, Ohio; and West Virginia Univ., Morgantown. Dept. of Civil Engineering.
Syed R. Qasim, and Jerry C. Burchinal.
Journal Water Pollution Control Federation, Vol 42, No 3, Part 1, p 371-379, March 1970. 9 p, 10 fig, 4 tab, 8 ref. USPHS Grant EF-40 (R1).

Descriptors: *Leaching, *Landfills, *Percolation, *Groundwater movement, Model studies, Laboratory tests, Path of pollutants, Water pollution sources, Self-purification, Biodegradation.
Identifiers: Simulated landfill.

Simulated landfills 3 ft in diam and 4 to 16 ft in height were filled with mixed municipal refuse. The cylinders were saturated with water and additional water added at two-week intervals. Percolated water was drained and analyzed on a regular schedule for chemical and bacterial quality. The study covered a maximum of 163 days. Concentration of extracted material increased initially but began to decrease after about four weeks. Another increase after eight weeks was evident. The concentration in the leachate of 18 organic and inorganic compounds over the period of the study is reported. pH showed a slight increase followed by a rapid decrease. Leach samples tend to undergo bacteriological and chemical self-purification. Deeper fills consume more water, before leaching occurs, take a longer time to decompose, and the bulk of the extracted material is distributed over a longer period. (Knapp-USGS)

PERSISTENCE OF PESTICIDE RESIDUES IN SOILS,
Agricultural Research Service, Beltsville, Md. Crops Research Div.
P. C. Kearney, R. G. Nash, and A. R. Isensee.
In: Chemical Fallout-Current Research on Persistent Pesticides, Proceedings Publication of Rochester Univ Conferences on Toxicity: Springfield, Ill, Charles C. Thomas Publisher, p 54-67, 1969. 14 p, 3 fig, 1 tab, 26 ref.

Descriptors: *Pesticide kinetics, *Pesticide residues, *Soil chemistry, *Biodegradation, Persistence, Translocation, Toxicity, Environmental effects, Leaching.
Identifiers: Pesticide-soil interactions.

Pesticide persistence in our environment is of current national interest. The effective life of pesticides in soils varies from a few weeks to several

years. Their persistence depends primarily on the structure and properties of the compound, and to a lesser degree on location and soil properties. Extremes in persistence are found with the insecticides. The highly toxic phosphates do not persist for extended periods of time in soils. In contrast, some of the chlorinated hydrocarbon insecticides may persist for four to five years under normal rates of application. Disappearance of most complex organic pesticides from soil follows a first-order reaction curve. Disappearance of simpler organic pesticides often exhibits a lag phase followed by rapid metabolism by soil microorganisms. Heavy metals and arsenic pesticides tend to accumulate at the application site. (See also W70-09559) (Knapp-USGS)

ENTRAINMENT IN DEFLECTED AXISYMMETRIC JETS AT VARIOUS ANGLES TO THE STREAM,
Toronto Univ. (Ontario). Dept. of Mechanical Engineering.
J. L. Platten, and J. E. Keffer.
Technical publication series UT Mech E TP 6808, June 1968. 53 p, 9 fig, 1 tab, 15 ref.

Descriptors: *Jets, *Mathematical models, Porosity, Density, Water circulation, Shear, Vortices, Velocity, Turbulence, Stream flow, Simulation analysis, Winds, Uniform flow.
Identifiers: Entrainment.

A mathematical model for the round turbulent jet in a cross-wind is proposed. The analysis accounts for varied initial angle of injection to the uniform stream and incorporates a function which attempts to simulate the two entrainment processes suggested by observation of the real flow. The first of these is the growth of a turbulent field such as in ordinary jets and wakes, arising from the presence of a mean velocity difference. The second mechanism, peculiar to the deflected jet is the entrainment stemming from the presence of a vortex pair. Because of the shearing action of the cross-wind on the jet, a circulation is generated and fluid is swept into the wake regions of the flow. The model is applied to experimentally determined jet centre lines for a number of velocity ratios and initial angles of injection. The resulting entrainment parameters were found to be invariant within initial angles of plus or minus 15 deg to the normal jet and only moderately invariant up to plus or minus 45 deg. THERMAL EFFECTS AND NUCLEAR POWER STATIONS IN THE U.S.A.,
Atomic Energy Commission, Washington, D.C.
R. E. Nakatani, D. Miller, and J. V. Tokar.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 12, 1970. Paper IAEA-SM-146/30. 14 p, 1 tab, 21 ref. Preprint.

Descriptors: *Thermal pollution, *Nuclear power plants, *Cooling water, *Water temperature, Condensers, Design, Standards, Fish kill, Algae, Cooling towers, Density, Viscosity, Fish behavior, Fertility, Seasonal, Diffusivity.
Identifiers: *Waste heat, Sublethel effects, Mixing zones, Modeling.

Nuclear power plants in the U.S. were surveyed that are either operable, being built, or planned as of December 31, 1969. Over sixty percent of the plants used the once-through system where the condenser cooling water was taken from nearby rivers, lakes, estuaries, or the ocean and then usually returned to the same source. The average maximum temperature rise across the nuclear power plant condenser was approximately 10 degree C. General observations and recommendations based on statements describing the planning, design, and procedures for waste heat release and information obtained from personal plant visits include: (1) thermal quality standards are becoming increasingly stringent; (2) fish kills are rare and their severity limited; (3) studies of the short- and long-range movement and effects of heat should be undertaken; (4) the effort should be made to acquire knowledge of the sublethel effects of releasing heat; (5) alternate methods for releasing waste heat should and are being employed; (6) the need for stochastic and analytic models of plume behavior exists. (Osborne-Vanderbilt)

STORM WATER POLLUTION FROM URBAN LAND ACTIVITY,
AVCO Economic Systems Corp.
Jerry G. Cleveland, Ralph H. Ramsey, and Paul R. Walters.
Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows', p 1-56, June 22-23, 1970. 6 fig, 14 tab, 4 ref. FWQA Contract 14-12-187.

Descriptors: *Storm runoff, *Water analysis, Pollution abatement, Drainage, Control, Water quality, Cities, Surface runoff, Precipitation, Analytical techniques, Land use.
Identifiers: Tulsa, Oklahoma.

An assessment of pollution in storm water as it relates to land activity is described. The central purpose of this effort was to design a method of analysis which would enable the city planner and engineer to assess the quality as well as quantity of storm water and to do so by looking at land activity, selected environmental factors, and precipitation. The scope of the project included a field assessment of the storm water pollution by obtaining samples of the water resulting from precipitation and surface runoff from selected areas in the Tulsa, Oklahoma metropolitan area; development of an analytical procedure for correlation of storm water pollution with selectively defined variables of land uses, environmental conditions, drainage characteristics, and precipitation; and development of a plan for implementing remedial measures necessary to abate or control sources of pollution in an urban area. Storm water runoff samples were collected from 15 'discrete' test areas. These samples were analyzed in terms of quality standards for BOD, COD, TOC, organic Kjeldahl nitrogen, soluble orthophosphate, chloride, pH, solids, total coliform, fecal coliform, and fecal streptococcus pollutants. Three approaches are recommended to abate and control the pollution load of storm runoff. These are: a reduction in total runoff, a reduction in runoff rates, and environmental policy. (See also W70-09558). (Marriott-Chicago)
W70-09615

STREAM POLLUTION AND ABATEMENT FROM COMBINED SEWERS BUCYRUS, OHIO,
Burgess and Niple Ltd., Columbus, Ohio.
Richard F. Noland, and Dale A. Decarlo.
In: Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows,' p 291-320, June 22-23, 1970. 16 fig, 3 tab. FWQA Contract 14-12-401.

Descriptors: *Overflow, *Storm drains, *Sewers, *Water pollution control, Engineering, Analytical techniques, Sampling, Urbanization, Ohio.
Identifiers: Combined sewer overflow, Lagoon system, Interceptor sewer, Bucyrus (Ohio), Sandusky River.

Results are described of a detailed engineering investigation and comprehensive technical study to evaluate the pollutional effects from combined sewer overflows on the Sandusky River at Bucyrus, Ohio which is tributary to Lake Erie. A year long detailed sampling and laboratory analysis program was conducted on the combined sewer overflows in which the overflows were measured and sampled at three locations comprising 64% of the City's sewered area and the river flow was measured and sampled above and below Bucyrus. The results of the study show that any 20-minute rainfall greater than 0.05 of an inch will produce an overflow. The combined sewers with overflow about 73 times each year discharging an estimated annual volume of 350 million gallons containing 350,000 pounds of BOD and 1,400,000 pounds of suspended solids. A method of controlling the pollution from combined sewer overflows is presented along with the degree of protection, advantages, disadvantages and estimate of cost. The method presented is an interceptor sewer and lagoon system. The most economical method of providing a high degree of protection to the Sandusky River is by collecting the combined sewer overflows with a large interceptor and using an aerated lagoon system to treat the waste lands from the overflows. (See also W70-09558). (Marriott-Chicago)

HYDROGEOLOGY OF SOLID WASTE DISPOSAL SITES IN NORTHEASTERN ILLINOIS,
Illinois State Geological Survey, Urbana.
G. M. Hughes, R. A. Landon, and R. N. Farvolden.
Available from Bureau of Solid Waste Management, 5555 Ridge Ave, Cincinnati, Ohio, 45213. U. S. Department of Health, Education, and Welfare, Bureau of Solid Waste Management, 1969. 137 p, 24 illus, 9 tabs, 3 ref. No. DO I - UI - 00006.

Descriptors: *Hydrogeology, *Solid wastes, *Landfill, *Infiltration, *Water quality pollution, Recharge, Discharge, Groundwater, Surface waters, Aquifers, Flow rates, Leaching.
Identifiers: Northeastern Illinois.

This project describes the hydrogeologic environments in the vicinity of four existing landfill sites in the Chicago Metropolitan area, in order to determine the controls on the movement of the ground water and the solids dissolved in ground water. Groundwater recharge and discharge areas are

ned and the quantities of water moved and s of movement through various materials and in ous environments have been estimated. Infor- ion from this preliminary study can be used by ılatory agencies to help determine environ- nts most suitable for near-surface disposal of te insofar as contamination of groundwater and face water is concerned. The problem of undwater contamination by near-surface solid te disposal is approached in terms of the rogeologic environment. In some sites, water t infiltrates the ground becomes part of a local v system and is discharged into a nearby stream swamp with little risk of contaminating an ifer. In other sites this water becomes part of a ional flow system and may enter productive ifers with definite risk of contamination. The inition of flow systems in homogeneous materi- is relatively simple; however, the effects on this w system of changes from one geologic material another are more difficult to evaluate. This in- mation is necessary if movement of refuse chate from proposed disposal sites is to be pre- ted. (Marriott-Chicago)

entifiers: *New York Harbor, *'Sweepers', *De- tering, *Harbor debris, Environmental quality, ooperative governmental program.

e-littering in the Nation's 250 harbors and chan- els is a staggering chore. In a survey of New ork's harbor and tributaries, 2,000 abandoned essels and over 2,300 shore structures and cluster f floatable debris were found to be potential drift ources. Sweeping boats removed some debris but ousands of accidents still occurred every year ausing expensive damage and danger. Two eneral approaches offered solutions to the drift roblem: (1) to increase removal and disposal of oating debris above present level, and (2) to liminate the sources of drift by removal or repair f derelict vessels and structures. Cost-benefit anal- sis showed the latter to be best. Costs of removal nd repair were estimated at $29 million and an an- ual cost of 1.5 million, while monetary benefits ould be over $10 million a year as well as other enefits of reduction in fire hazards, air and water ollution, hazards to life and health and improved ppearance of the waterfront. A national survey ecommends an aggressive program to remove ources of drift. Such a program offers an opportu- nity for cooperation between Federal, State and ocal governments to improve the quality of urban nvironment. Successful implementation, requiring enactment and enforcement of local ordinances to regulate sources of drift, would greatly help in re- lieving conditions of waterfront decay, ugliness and blight, free waterside sites for functions having positive effects on their neighborhood areas; and bring about higher levels of usefulness and safety for both commercial and recreational users of our Nation's vital waterways and harbors. RADIONUCLIDE TRANSPORT AND RESPONSES TO ORGANIC STRESS IN A RESEARCH FLUME,
Texas Univ., Austin.
E. F. Gloyna, Y. A. Yousef, and T. J. Padden.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 13 p, 7 fig, 4 tab, 13 ref.

Descriptors: *Flumes, *Streams, *Mathematical model, *Plants, *Sediments, Ecology, Toxicity, Water pollution sources, *Ecosystems.
Identifiers: Organic stress, *Radionuclides, *Activity systems.

Small ecosystems established in aquaria, control reservoirs, and large flumes are useful tools for simulating stream processes and evaluating the complex factors which interact with various pollutional stresses. By simulating the physicochemical characteristics of an aquatic system the flume can be used to determine the interrelationships between atmospheric reaeration, photosynthesis, respiration, organic load, biomass, and sediments. Measurements of responsed of the aquatic system to conventional pollutional stresses and radionuclide behavior can and has been shown to aid in the development and verification for prediction models. The principal mechanism of radionuclide transport is hydrodynamic, however, other influences of the rate of movement are: (1) the amount and type of suspended matter, (2) chemical character of the bottom sediment and aqueous system and (3) surface and concentration of radionuclide of both the dead sediments and biomass. The organic suspension when compared on a unit weight basis tended to sorb 103Ru in much larger amounts than inorganic suspensions. Sorption of 137Cs by clay suspensions was a function of the amount and type of clay in suspension. The amount of radionuclide retained by dead sediment is a function of organic pollution. Side-wall temperature must be controlled carefully in small-scale systems to prevent convection currents, particularily if controlled by atmospheric aeration is important. (Hancuff-Texas)

Descriptors: *Water pollution effects, *Pesticides, Residues, *Pesticide kinetics, *Persistence, Evaporation, Biodegradation, Adsorption, Algae, Clays, Aldrin, Dieldrin, DDT, Aeration, Silts.
Identifiers: Chlordane.

The persistence of the insecticides aldrin, dieldrin, chlordane, and DDT in water were measured. A small area was sprayed with these compounds, and the insecticides were collected in the runoff water from the area. Laboratory experiments were performed to determine the effectiveness of aeration, adsorption on silt, and adsorption on algae in removing the pesticides from water. All of the pesticides were found in samples of water collected for the full period of the tests. The amounts which were found in a small pond into which the surface water drained was consistently less than that found in the surface runoff water itself. The reduced concentrations in the pond water were apparently the result of a combination of sedimentation, adsorption on algae or silt, or volatilization of the insecticide from the water into the atmosphere. In general, the efficiency of removal of insecticide from water by any one of these processes appears to be low. However, because of the large ratio of absorbant to insecticide, the overall removal is substantial. (Knapp-USGS)

STORM WATER POLLUTION, NEW ORLEANS, LOUISIANA.
New Orleans Sewerage and Water Board, La.

Supplementary Report, June 1970. 56 p, 52 fig. Repair Work in Conjunction with Community Renewal Program Project No. La-R-6 (CR).

Descriptors: *Repairing, *Sewers, *Leakage, *Inflow, *Water pollution control, *Pollution abatement, *Drainage systems, *Storm drains, *Drainage systems, *Municipal wastes, *Sewerage, *Pumping plants, *Disinfection, *Chlorination, *Water quality control, Waste water treatment, Path of pollutants, Lakes, Infiltration.
Identifiers: *Sewer repairs, *Leakage repairs, *Pipe repairs, *Sewer repair costs, *Storm water pollution, *Sewer inspection, *Sewer leakage, *House sewers, Lake Pontchartrain, New Orleans, Televised inspections.

The results were evaluated of sewer repairs that were made by the New Orleans Sewerage and Water Board to correct major leaks and defects found using television equipment. Field inspection work was conducted in 1969 to determine how and to what extent the storm waters discharged to Lake Pontchartrain are being polluted by domestic sewage. The results were published in a basic report, having the same title as this supplementary report, dated June 1970. Upon completion of the repairs of 47 major defects, exfiltration tests were made on the repaired lines. The results indicated excessive leakage still existing. There must be considerable leakage from unrepaired house sewer connections. If all house connections 20 years or older are repaired, the costs would be over $30 million. Other actions planned or underway include: relining existing sewer pipes with flexible thin plastic pipe; construction of a new sewer line to eliminate discharges of contaminated sewage from overloaded pumping stations; and installation of disinfection facilities at sewage pumping stations, using sodium hypochlorite. A unique plant for preparing the chemical was constructed. Television photographs of pipe leakage and exfiltration data are included. (Poertner)

Identifiers: *Storm water pollution, *Sewer leakage, *Cross flow, *Televised inspections, *House sewers, *Cross connections, *Sewer inspection, Lake Pontchartrain, New Orleans, Infiltration tests.

The findings are presented of field inspections of the operating condition of sanitary sewers and storm sewers in New Orleans to determine how, and to what extent, the storm waters discharged to Lake Pontchartrain are being polluted with domestic sewage. Television cameras were pulled through sewers to view leakage into sewer pipes at open joints, fractures and house connections. Leakage between 8 inch diameter sanitary sewers and storm sewers were first studied carefully by means of conducting exfiltration tests in selected city blocks where both sanitary and storm sewers are present. It was found that the major source of storm water pollution came from accidental cross flows between sanitary sewer house connections and storm sewers at points of crossing, particularly where house sewers cross beneath storm sewers. These cross flows resulted from broken or cracked pipes and pipe joints in both systems. The fractures are attributed to the weight of the overlying storm sewer on the house connections beneath. Soil settlements caused the storm sewers to settle until they exerted forces on these pipes. Recommendations are given for the design and installation of sanitary sewers, house connections, and storm sewers. Explanation of field inspection procedures and television inspection data are included. (Poertner)

INTERMEDIATE PRODUCTS IN THE BACTERIAL DECOMPOSITION OF HEXADECANOL AND OCTADECANOL,
Texas A and M Univ., College Station.
W. D. Langley.
Available from the NTIS as PB-194 237, $3.00 in paper copy, $0.65 in microfiche. Texas A and M University Water Resources Institute Technical Report TR-29, June 1970. 59 p, 13 fig, 4 tab, 16 ref. OWRR Project No A-012-Tex (1).

Descriptors: *Biodegradation, *Hexadecanol, *Octadecanol, *Monomolecular films, Alcohols, Evaporation control, Analytical techniques, Sampling, Bacteria, Aquatic microbiology, Chromatography.
Identifiers: Gas-liquid chromatography.

The biodegradation of the monolayer film-forming chemicals hexadecanol and octadecanol were related to water quality factors. Detection, identification, and behavior of any intermediate or end product compounds formed as a result of the biological transformation of the hexadecanol or octadecanol were investigated. The behavior of long chain fatty alcohols was correlated with published analyses of lower molecular weight alcohols. Straight chain primary alcohols appear to represent a competitive substrate system with respect to microbial selectivity. In the presence of branched chain primary alcohols, the straight chain forms appear to constitute a preferred substrate system. The branched chain primary alcohols are biodegradable; their rate of degradation is however, retarded. (Knapp-USGS)

SIGNIFICANCE OF DDT RESIDUES FROM THE ESTUARY NEAR PENSACOLA, FLA,
Bureau of Commercial Fisheries, Gulf Breeze, Fla., Center for Estuarine and Menhaden Research, Breeze, Fla.
David J. Hansen, and Alfred J. Wilson, Jr.
Pesticides Monitoring Journal, Vol 4, No 2, p 51-56, September 1970. 6 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Pesticide residues, *Fish, *Florida, *DDT, *Estuaries, Path of pollutants, Toxicity, Persistence, Water pollution sources.
Identifiers: Pensacola Bay (Fla).

Pesticide residues in fishes from the estuary near Pensacola, Fla., monitored from April 1964 to November 1965, are compared with residues in fishes exposed to DDT in the laboratory. DDT in fish exposed to 0.1 ppb p,p'-DDT 5 weeks failed to increase after the second week, when maximum concentrations reached 38,000 times that in the test water. Loss of DDT from these fish was slow, 78%-87% in 8 weeks. The amounts of DDD or DDE in fish did not increase either during or after exposure. Residues in fish from the estuary rarely exceeded 0.1 ppm except in those collected from the lower estuary in the summer and fall when the amount of DDT and its metabolites reached 1.3 ppm. Fish from the lower estuary had more DDT and less DDD and DDE than fish from the upper estuary. The DDT content in lower estuarine fish increased in July, August, and September. One source of DDT was a county-sponsored spray program centered in the lower estuary in July and August. (Knapp-USGS)

DIFFUSIVE PROPERTIES OF INTERFACIAL LAYERS,
Chalmers Univ. of Technology, Goteborg (Sweden). Hydraulics Div.
Anders Sjoberg.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D8, p 71-78, 1967. 8 p, 5 fig, 11 ref.

Descriptors: *Stratified flow, *Density stratification, *Thermal stratification, *Mixing, *Path of pollutants, Dispersion, Diffusion, Turbulence, Turbulent flow, Fjords, Interfaces, Shear.
Identifiers: Sweden.

The Swedish coastal waters - particularly on the West Coast - have a pronounced density stratification. It is possible to design a submarine outfall in such a way that a submerged sewage field is established. It is necessary to know how the vertical stability of such a submerged sewage field is affected by surface currents, wind generated waves, and turbulence at the bottom. The few experimental investigations of stratified flow which a theory can be based on are reviewed and as much information as possible is extracted from these investigations. Experimental data are presented in a manner suitable to the description of turbulent transfer of matter and momentum across interfaces. (Knapp-USGS)

Identifiers: *Radio contamination, Operation Swordfish, Pelagic organisms, Sessile organisms, Migratory organisms, Migratory interception, Filter feeders, Radioactive pool size, Biological monitoring, Kelp, Seaweeds, Gelidium cartilagineum, Macrocystis pyrifera, Alginic acid, Agar, Mucopolysaccharidic envelope, Ulva.

For a situation represented by instantaneous release of strontium-90-oxide in the ocean, a model of biotic radiocontamination has been devised based more realistically on known characteristics of coastal marine organisms. In this contamination model radioactivity concentration in soft tissues of migratory fish has been determined by pool radioactivity using a modified Carter-Okubo diffusion model, uptake and concentration kinetics, and migratory interception as a function of pool size. Reasonably good validation was provided by information available from Operation Swordfish, and differences in Operation Swordfish release and a hypothetical release of strontium-90-oxide were examined. For 750 curies of strontium-90-oxide released, probably contamination of economically important pelagic fish would be accordingly less than consequent on a water concentration maintained at 1 million parts/cubic centimeters. Certain limitations as to generalizing this model are discussed. The problems arising chiefly concern behavior of sedentary organisms, and biological uptake during very protracted release conditions. In these two cases present state-of-the-art does not permit adequate assessment of radiocontamination. The localized release considered here cannot constitute a potential hazard to man if normal radiation protective actions are implemented. (Jones-Wisconsin)

Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 7 p, 7 fig.

Descriptors: *Research and development, *Water pollution, Phosphorus, Thermal stratification, Currents (Water), Algae, Lakes, Rivers, Sewage disposal, Sewage treatment, Waste water treatment.
Identifiers: *Marine disposal, *Gothenbrug, Sweden.

The city of Gothenburg at the west coast of Sweden plans to construct a system of intercepting sewers and rock tunnels by which all the sewage from the city can be conveyed to a treatment plant. After biological treatment, the sewage can be discharged either into the river mouth or into the sea outside a nearby archipelago. In order to compare the different outfall sites, an investigation of the area was undertaken from the mouth of the river, Gota Alv, through the archipelago into the open sea. The mean values and standard deviations of the vertical distribution of temperature, salinity and density during summer and winter in the area outside the archipelago are presented graphically. Large variations of current patterns take place due to tides, winds, and variations in the atmospheric pressure. The main directions of the currents are North and South with the resultant to the North. A figure is

sented showing the frequencies spectrum densi- The study of the use of a diffuser system for the persal of treated sewage resulted in the following sign and conclusions: The area of release is 3 km st of the archipelago. The diffuser portholes are m in diameter and located 30 to 35 m below the face. The initial velocity through the portholes l be 2.5 meters/second. With this arrangement d the existing vertical density stratification the m will rise to a level of 14 to 20 meters below surface. (Hancuff-Texas)

lentifiers: Pesticide effects (Ecological), Mercury.

symposium was held on the topic of the effects of ersistent pesticides on ecological systems, includng effects on man. Five sections are arranged in a equence that follows pesticides from their entry nto the ecological systems to their ultimate effects n the human population. The ecological fate of esticides is narrowed from ecosystems to single opulations and their relationships to economic, olitical-administrative, and agro-ecological social ubsystems. Examples are given of the way in which he interplay of economics and politics makes cology a more complicated study to government nd industrial scientists than to university-based cologist. The mechanism of damage in individuals s examined. Protecting human populations from damage caused by these persistent pesticides is discussed by the editors. In: Chemical Fallout-Current Research on Persistent Pesticides, Proceedings Publication of Rochester Univ Conferences on Toxicity: Springfield, Ill, Charles C. Thomas Publisher, p 221-241, 1969. 21 p, 8 fig, 6 tab, 21 ref.

Descriptors: *Heavy metals, *Poisons, *Pesticide residues, *Water pollution sources, *Persistence, Biochemistry, Path of pollutants, Chemical wastes, Aquatic environment, Environmental effects, Toxicity, Water pollution effects, Fish, Birds.
Identifiers: Mercury.

Mercury and mercury compounds have a wide use in agriculture and industry, and an increase in natural levels of mercury content has been recorded. By means of activation analysis, the mercury content in feathers of eleven Swedish terrestrial bird species was studied. The material was derived from museum collections and from living or freshly killed birds; it covers a period of more than 100 years. These studies reveal nearly constant mercury levels from the middle of the previous century until 1940. After that, a well-documented increase in mercury concentration occurs, amounting to at least ten to twenty times the previous level. In 1940 alkylmercury compounds began to be used as seed dressings. The mercury content in axial musculature of pike (Esox lucius) has been used for estimating the level of mercury in the aquatic environment. Two fish-eating bird species show a gradual increase in mercury content since the previous century. (See also W70-09559) (Knapp-USGS)

POSSIBILITIES FOR BENEFICIAL USES OF HEATED WATER DISCHARGES INTO COOLING RESERVOIRS,
Missouri Univ., Columbia. Dept. of Zoology.
Robert S. Campbell, Arthur Witt, Jr., and James R. Whitley.
Fifth Annual Water Resources Research Conference, Feb. 3-4, 1970, Washington, D.C., U.S. Dept. of Interior, Office of Water Resources Research, June 1970. p 57-64, 27 ref.

Descriptors: *Heated water, *Beneficial use, *Cooling water, *Fisheries, Water quality, Fish attractants, Fish harvest, Plankton, Benthic fauna, Algae, Ecology, Missouri.
Identifiers: Cooling reservoir, Artificial reservoir, Montrose Lake, Thomas Lake.

Montrose Lake and Thomas Lake in Missouri were studied. Both were artificial cooling reservoirs. Studies included water quality, primary production of algae, plankton and bottom fauna and fish. Impact of heated water upon the ecology of a reservoir will be lessened as the volume of the reservoir is increased. Employment of a long cooling canal results in loss of heat to the atmosphere prior to discharge into the reservoir. Under the conditions existing in Thomas Hill Reservoir, no lethal effects from heated water inflow was observed. Beneficial effects which may be derived from controlled discharge of heated water are: (a) Migration of fishes may result in a buildup of fish densities. (b) The increased density of fishes may provide an extended harvest into the winter period. (c) Continued growth of game fishes may occur during the winter period. (d) An increased production of commercially raised fish may be possible. (e) The location of the power plant might be planned to provide optimal conditions for fish harvest and for use of heated water effluent in hatchery and rearing pools. (Hsieh-Vanderbilt)

PLUME EFFECTS OF NATURAL DRAFT HYPERBOLIC COOLING TOWERS,
Gilbert Associates, Inc., Reading, Pa.; and Metropolitan Edison Co., Reading, Pa.
Robert F. Visbisky, George F. Bierman, and Carroll H. Bitting.
Gilbert Associates, Inc. Interim Report. 11 p, 4 fig, 1 ref.

Descriptors: *Cooling towers, *Fog, *Aerial photography, *Statistical models, Meteorological data, Weather patterns, Micrometeorology, Heat transfer, Momemtum transfer, Wind velocity, Temperature, Humidity, Computer models.
Identifiers: *Visibility, Plume.

Preliminary investigations of the effects of cooling tower plumes were performed by various methods such as photography, mathematical modeling and meteorological measurements. The results of the studies to date indicate that cooling tower plumes will, at times, contribute to local cloud formations in varying degrees, depending on atmospheric conditions. The degree of this contribution does not appear to have a significant effect upon the operation of an airport approximately 2 1/4 miles from the plant site. The airport is not located in the predominant downwind direction. Temperature and relative humidity measurements by aircraft at low altitudes are presently being analyzed. The correlation of this information with data already accumulated by other means will further refine the predicted plume characteristics for this particular location. Generally speaking, investigative work has only begun and much more will have to be accomplished. (Hsieh-Vanderbilt)

EFFECTS OF HEATED DISCHARGES ON THE AQUATIC ENVIRONMENT THE TVA EXPERIENCE,
Tennessee Valley Authority, Chattanooga.
M. A. Churchill, and T. A. Wajtalik.
Proceedings, American Power Conference, 1969, Vol 31. 9 p, 9 fig, 1 tab. Also (in slightly different version) in Nuclear News, Sept. 1969, p 80-86. 6 fig, 6 tab.

Descriptors: *Thermal pollution, *Heated water, *Thermal powerplants, *Nuclear powerplants, *Water temperature, *Aquatic life, Tennessee Valley Authority Project, Isometherms, Fish, Periphyton, Benthic fauna, Zooplankton.
Identifiers: *Temperature distribution.

Since 1955, TVA has been observing the distribution in streams and reservoirs of heated waters discharged from TVA's thermal-electric powerplants. Detailed biological surveys have been made at all of TVA's steam plants except the Shawnee located on the Ohio River. No significant effects on aquatic life have been found except at the Paradise plant on the small Green River in Kentucky. Here, observed effects on fish-food organisms indicated more control of maximum stream temperatures to be desirable. Cooling towers have been built here. At the two nuclear power plants now under construction, multiport diffusers on the bottom of the old river channel in the receiving reservoirs will provide diffusion and rapd mixing. Stream temperatures will not be allowed to increase more than 10F, nor to exceed 93 F, at any time. (Hsieh-Vanderbilt)

THE THERMAL ENRICHMENT OF AQUATIC HABITATS,
Central Electricity Generating Board, Berkeley (England).
R. SA. Beauchamp, F. F. Ross, and J. W. Whitehouse.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 13 ref.

Descriptors: *Heated water, *Beneficial use, *Water temperature, *Heat resistance, Fish, Salmonids, Powerplants, Bottom sediments, Oxygen sag, Plankton, Benthos, Ecology.

This paper is concerned with power station cooling water discharges into rivers, lakes, estuaries and marine waters, and their effects on the ecology of such waters. Eighteen years' work by the biologists of the C.E.G.B. and its predecessors in title are summarized. The use of river water usually improves its quality and capacity to support a variety of aquatic life. In freshwater there would appear to be few problems, provided the temperature does not exceed the appropriate limit for the fish concerned, with no limitation on temperature-rise. It has to be established whether it is justifiable to install expensive engineering works to restrict maximum temperatures to less than 30C in marine waters. It will be economically advantageous to discharge a small quantity of cooling water per kwh at a higher temperature than has been the practice hitherto. If this discharged warm water is spread out over the surface of the estuary it will cool rapidly, no harm to fish will result, and the benthos will not be affected. (Hsieh-Vanderbilt)

COOLING WATER OUTLET IN A STRATIFIED RECIPIENT,
Vattenbyggnadsbyran Ltd., Stockholm (Sweden).
I. Larsen.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 4 p, 1 fig, 2 ref.

Descriptors: *Cooling water, *Density stratification, *Thermal stratification, *Intakes, *Outlets, Nuclear powerplants, Mixing, Convection, Turbulence, Salinity, Winds.
Identifiers: *Selected withdrawal.

An outlet of cooling water from a nuclear power plant into a receiving water with a marked stratification due to differences in salinity is discussed. Due to this stratification, a low temperature of the cooling water at the bottom intake can be secured and recirculation of heat can be avoided. The spreading of the heated water is affected by the stratification. (Hsieh-Vanderbilt)

THE IMPACT OF ENVIRONMENTAL RADIATION AND DISCHARGE HEAT FROM NUCLEAR POWER PLANTS,
Westinghouse Electric Corp., Pittsburgh, Pa.
J. H. Wright, J. B. F. Champlin, and O. H. Davis.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 12, 1970. Paper IAEA-SM-146/20. 21 p, 6 fig, 1 tab, 6 ref. Preprint.

Descriptors: *Nuclear power plants, *Radiation, *Cooling water, *Heated water, Fish, Radioisotopes, Potable water, Cyanophyta, Chlorophyta, Oxygen sag, Aquatic environment, Biochemical oxygen demand, Water temperature, Nutrient requirements, Metabolism, Fishkill, Shellfish.
Identifiers: *Federal Radiation Council.

The exposure to the general public from maximum AEC emissions is between 1 and 5 mrem/year. A large nuclear reactor would have to operate with all of the fuel in a failed and leaking condition in order to develop the maximum isotope release allowed. More than 1000 large nuclear plants could be operating on the same site at the level of 1% failed fuel without exceeding the FRC recommended exposure to the nearby general public. The average nuclear powerplant cooling ponds yield an exposure of only .12 mrems per year to a person who obtains his average fish diet from the small pond plus all of his drinking water. Heat discharge from nuclear power plants has also caused negligible change in the aquatic ecosystem. However, a river already high in biological oxygen demand from raw sewage and industrial wastes may develop an oxygen sag, below the life support level is subjected to the further stress of heated discharges. A shift in temperature of 8 deg C is all that is required to alter optimum production temperature from green to blue-green algae, if nutrient levels will also support the bloom. (Osborne-Vanderbilt)

DOES INDUSTRIAL COLEFACTION JEOPARDIZE THE ECOSYSTEM OF A LONG TIDAL RIVER,
Connecticut Yankee Atomic Power Co., Haddam.
Daniel Merriman.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 12, 1970. Paper IAEA-SM-146/31. 33 p, 5 fig, 1 tab, 45 ref. Preprint.

Descriptors: *Nuclear power plants, Effluents, Water temperature, Benthic fauna, Fish kill, Salmon, Cost-benefit ratio, Ecosystem, Smolt, Catfish, River flow, Hydrologic data.
Identifiers: *Colefaction, Connecticut River, Shad, Marasmus.

The Connecticut Yankee Atomic Power Company discharges its effluent into the Connecticut River at a temperature of 12.4 degree C above that at intake and at a rate of 1400 m cu/min. To determine the effects of the effluent, the preoperative phase while the plant was being built (1965-1967) was compared with the operative phase (1968-present). Included in this comparison were present and past studies of physical and chemical characteristics of the lower reaches of the river, of the benthic fauna, of the population dynamics of the resident fish fauna, and of the fish kills. Salmon restoration in the river would not be affected by electric generating plants. River water was being effectively used for the production of electricity with minimum harmful environmental disruption. The short term observation failed to take into account subtle, long-term effects which were not predictable at that time. By 1971-1972, much more information will be available to determine the success of shad emmigrating past the Connecticut Yankee effluent, but presently, the harm is outweighed by the benefits. Forty-five references are included. (Osborne-Vanderbilt)

THERMAL EFFECTS STUDIES IN NEW YORK STATE,
Stoller (S. M.) Associates, New York; and Niagara Mohawk Power Corp., Buffalo, N.Y.
Thomas W. Philbin, and Howard D. Phillipp.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 12, 1970. Paper IAEA-SM-146/32. 13 p, 3 tab, 10 ref. Preprint.

Descriptors: *Power plants, *Thermal pollution, *Thermal stratification, Hydraulic models, Fish, Algae, Fathometers, Benthic fauna, Benthic flora, Lake Ontario, Hudson River, Standards, Surface waters, Epilimnion, Intake structures, Discharge (Water), Water temperature.
Identifiers: Lake Cayuga, Cladophora, Ecological studies.

Several thermal effects studies have been and are presently underway to determine what the effects of thermal discharges are on the water environment of New York State. At present, the results are incomplete; but they do yield enough information to allow some initial conclusions. On Lake Ontario, the Ginna and Nine Mile Point studies showed that fish tended to gather around both intake and discharge structures, slightly altering the local fish and benthic distributions. On Lake Cayuga, the Bell Nuclear Station has been postponed with no immediate plans for resumption. Physical effects studies on the lake, if the Bell Station plant were operating, have yielded a probable 0.7 degree F rise in the average surface temperature along with an eight to ten day longer stratification period. Moreover, in October, water could possibly be drawn from the epilimnion, increasing discharged water another 5 degree F. However, if New York State discharge standards are adhered to, no acute effects are anticipated even close to the outfall. On the Hudson River, on the other hand, increased water temperatures as high as 91 degree F do not appear to influence the abundance of fish. (Osborne-Vanderbilt)
W70-09614

THE RELATIVE SIGNIFICANCE OF PHOSPHORUS AND NITROGEN AS ALGAL NUTRIENTS,
North Carolina Water Resources Research Inst., Raleigh.
Charles M. Weiss.
Available from the NTIS as PB-194 054, $3.00 in paper copy, $0.65 in microfiche. Report No. 34, Water Resources Research Institute of The University of North Carolina, June 1970. 54 p, 27 fig, 8 ref, 2 append. OWRR Project B-003-NC (2).

Descriptors: Eutrophication, *Algal blooms, *Nutrients, *Phosphorus, *Nitrogen, *North Carolina.
Identifiers: Nutrient interchange, Haw River, New Hope River.

By the examination of the interaction between nitrogen and phosphorus species relative to algal growth in several fresh water environments of differing trophic state, it has been possible to establish the relative significance of these elements as algal nutrients. The algal assay was carried out using membrane filtered samples derived from a series of oxidation ponds receiving secondary effluent from a trickling filter plant and from samples derived from sampling points on the New Hope and Haw Rivers. The latter represented a series of changing river qualities with particular respect to the oxidation states of nitrogen and phosphorus. The algal assay used pure cultures of five species; Euglena rostifera, Chlamydomonas reinhardtii, Pandorina morum, Scenedusmus quadricauda, and Chlorella ellipsoidea. Each of these species has been described as normally associated with polluted waters. The results of both chemical and biological assay examined through multiple regression analysis of the independent variable involved in the algal assay as well as a quadratic analysis of covariance of NH3-N, NO3N and PO4-P established the relative significance of the nitrogen and phosphorus species in water containing high concentrations of these elements, concentrations normally found in discharges from biological waste treatment plants and following dilution in receiving streams. Under these circumstances it has been shown that the quantity of nitrogen rather than that of phosphorus determines the biomass of algae that might be expected to grow. This response holds true for the several species of algal that were used. It would thus appear that the question of algal nutrients takes on a somewhat more formidable dimension due to the considerably greater difficulty in removing in significant amounts the nitrogen that is normally found in municipal waste waters.

VARABILITY OF WINTERKILL SURVIVAL IN FISHES,
Wisconsin Univ., Madison. Water Resources Center.
Ronald J. Berg, and John J. Magnuson.
Available from the NTIS as PB-194 031, $3.00 in paper copy, $0.65 in microfiche. Final Report, University of Wisconsin, Water Resources Center, 1970. 40 p, 4 tab, 2 fig, 25 ref, append. OWRR A-024-WISC (1).

Descriptors: *Dissolved oxygen, *Winterkilling, Yellow perch, Wisconsin.
Identifiers: Grassy Lake, Trout Lake.

Dissolved oxygen concentrations lethal to yellow perch from Grassy Lake, which has a history of winterkill, were compared with concentrations lethal to yellow perch from Trout Lake, which does not winterkill, to determine if yellow perch from

ssy Lake were more tolerant. Closed system pirometers (57kliter aquaria containing 24 liters vater with mineral oil) were used. Dissolved oxn was determined by the Alsterberg modificaof the Winkler method. Winter experiments en directly from both lakes and with yellow ch which were taken from both lakes and then limatized to aerated holding ponds. Mean oxn concentrations lethal to ten fish (8 to 32 g) en directly from Grassy Lake which were acclitized to aerated ponds were 0.15 mg and 0.35 /liter, respectively. Mean oxygen concentrations al to ten fish (12 to 16 g) taken directly from ut Lake, and twenty fish (10 to 83 g) from ut Lake which were acclimatized to aerated ds were 0.36 mg and 0.45 mg/liter respectively. ring the summer yellow perch from Grassy Lake e still more tolerant to low oxygen than those n Trout Lake. Mean oxygen concentrations al to twenty fish (8 to 38 g) from Grassy Lake, eighteen fish (9 to 22 g) from Trout Lake were 2 and 0.81 mg/liter, respectively.

ENVIRONMENTAL POLLUTION FROM HIGHWAY DEICING COMPOUNDS,
Maine Univ., Orono. Dept. of Plant and Soil Sciences.
F. E. Hutchinson.
Journal of Soil and Water Conservation, Vol 25, No 4, p 144-146, July-August 1970. 3 p, 1 fig, 3 tab, 7 ref. OWRR Project A-007-ME.

Descriptors: *Water pollution effects, *Sodium chloride, *Highway icing, *Snow removal, *Maine, Deicers, Roads, Chemcontrol, Salts, Groundwater, Leaching, Saline soils, Saline water.
Identifiers: Highway ice removal.

During the period 1965-1969, a study was made to determine what environmental pollution, if any, resulted from the average annual application of 25 tons of sodium chloride to each mile of paved highway in Maine. Analyses of water samples indicated that wells and farm ponds were seriously contaminated with chloride ions. Soil sample analyses revealed that soils contiguous to highways contained sodium levels that threaten vegetation and soil drainage. Concentrations of these ions in rivers apparently were not influenced by this practice. (Knapp-USGS)

Descriptors: *Detergents, *Sea water, *Environment, Mollusks, Crabs, Toxicity, Fisheries, Enzymes, Physicochemical properties, Hydrogen ion concentration, Salinity, Mortality, Animal behavior, Water pollution effects, Surfactants, Gastropods.
Identifiers: Nucella lapillus, Littorina saxatilis, Littorina littorea, Mytilis edulis, BP 1002, Dasic 'Slickgone', Petrofina 'Tarsolvent', Buccinum undatum, DS 4359, Carcinus maenas, Eupagurus, Psammechinus miliaris, Mucus secretion, Median tolerance limit, Delayed mortality, Oil emulsifiers.

Generally, detergents have considerable toxicity, ranging from -1 to more than 1000 ppm. During an evaluation of detergents' effects, the growth of shore-dwelling gastropod molluscs was studied because they could be easily and permanently marked, and could be released to and recovered readily from the shore. Littorina saxatilis, Littorina littorea, and Nucella lapillus were investigated for growth after treatment with a range of acute and apparently sub-lethal concentrations. Information on mortality and effects of predation upon treated animals was obtained. The effects of detergents on the closing of the operculum may be due to enzyme inhibition reactions, interaction between the detergents and other toxic substances present in seawater, or physico-chemical interactions between the detergents and seawater, and possibly the mucus secretion on the animal body. It is shown that the median tolerance limit derived from a short period recovery technique is a poor indicator of long term mortality due to dosage by detergents. Both mortality and inhibition of growth may be significant at very low concentrations, while inactivation may have more effect upon survival than mean tolerance limit. (Jones-Wisconsin)

THE CONDITION OF LAKES AND PONDS IN RELATION TO THE CARRYING OUT OF TREATMENT MEASURES,
P. J. Laurent, J. Garaucher, and P. Vivier.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 10 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Lakes, *Ponds, *Waste water treatment, *Sewage treatment, *Biology, *Nitrification, Dissolved oxygen, Water pollution, Thermal stratification, Depth, Microorganisms, Microbiology, Eutrophication.
Identifiers: Chemical compositions, Leman Lake, Annecy Lake, Nantua Lake.

Several aspects of the pollution and associated nitrification occuring in the three largest freshwater lakes in eastern France are presented. In addition the remedial measures being carried out or proposed are described. Data are presented on two of the lakes with respect to percentages of saturation of dissolved oxygen and temperature from 1937 to 1968. For one of the lakes the nitrates in the deep water have nearly doubled in ten years and the total phosphorus is increased from 15 to 25

micrograms/l for the whole lake. Biological studies were done through the collection of samples of net plankton. The counts of each main group of algae are tabulated and give additional information about the changes in the lakes. The measures taken against eutrification were provision of the towns with mechanical and biological treatment systems followed by the chemical removal of phosphorus. After a great technical and financial effort in 1968, the equivilant of 44% of the litoral population was connected to these stations. The sanitary improvement has also dealt with the treatment through composing of garbage; formerly a large part of the refuse was disposed in streams and carried into the lake during the flood period. One lake seems to have stopped its trends towards increasing nitrification. For another of the lakes despite the employment of mechanical and biological treatment unfavorable chemical and biological evolution has taken place. (Hancuff-Texas)

ACUTE TOXICITY OF TWO ORGANIC MERCURY COMPOUNDS TO THE TELEOST, ORYZIAS LATIPES, IN DIFFERENT STAGES OF DEVELOPMENT,
Toho Univ., Tokyo (Japan). Dept. of Biology.
Akio Akiyama.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 36, No. 6, 1970, p 563-570. 4 fig, 2 tab, 13 ref.

Descriptors: Bioassay, *Toxicity, Heavy metals, *Fish eggs, *Lethal limit, Fungicides, *Embryonic growth stage, Copper sulfate, Mode of action, Regression analysis, Resistance.
Identifiers: *Mercury, *Oryzias latipes, PMA, MEMC, Uspulum, *Mercuric chloride, *Phenylmercuric acetate, *Metoxygethylmercuric chloride.

The differential susceptibility of eggs, developing embryos, fry, and adult of a cypridont fish, Oryzias latipes, have been studied on the base of the 24-hour Median Tolerance Limit (TLm) to the organic mercury compounds, phenylmercuric acetate and metoxyethylmercuric chloride. Metoxyethylmercuric chloride was less toxic than phenylmercuric acetate. To metoxyethylmercuric chloride, 24-hour TLm for eggs, fry, and adult was 0.50-1.30, 1.48 and 1.74 ppm, respectively, while to phenylmercuric acetate, 0.18-0.26, 0.03, and 0.21 ppm, respectively. Adult fish were more tolerant than fry, but eggs in the solution of PMA were most resistant. In developing embryos, 24-hour TLm to the organic mercury compounds gradually increased through the early stage, passed through a maximum to the median phase, at 5 day old, and finally fell off in the later phase, in a general minimum. With the process of growth of fish, 24-hour TLm increased logarithmically. (Sjolseth-Washington)

CONCENTRATIONS OF TRACE ELEMENTS IN GREAT LAKES FISHES,
Argonne National Lab., Ill.; and Bureau of Commercial Fisheries, Ann Arbor, Mich.
Henry F. Lucas, Jr., David N. Edgington, and Peter J. Colby
Journal Fisheries Research Board of Canada, Vol. 27: 677-684, 1970. 2 tab, 12 ref.

Descriptors: *Trace elements, Heavy metals, *Great Lakes, Lake Michigan, Lake Superior, Lake Erie, Toxicity, Fish toxins, Perches, Alewife, Cobalt, Chromium, Copper, Gold, Water pollution sources, Neutron activities analysis, Shiners.
Identifiers: Uranium, Thorium, Cadmium, Arsenic, Antimony, Lanthanum, Rhenium, Rubidium, Selenium, *Tissue analyses, Bromine, Fish livers.

The concentration of 15 trace elements was determined by activation analysis of samples of whole fish and fish livers from three of the Great Lakes; Michigan, Superior, and Erie. The average concentrations of 7 elements in 19 whole fish from 3 species were as follows: uranium, 3 ppb (parts per billion); thorium, 6 ppb; cobalt, 28 ppb; cadmium, 94 ppb; arsenic, 16 ppb; chromium, 1 ppm; and copper, 1.3 ppm. The average concentrations of 8 elements in 40 liver samples from 10 species of fish were as follows: uranium, approximately 2 ppb; thorium, less than or equal to 2 ppb; cobalt, 40 ppb; copper, 9 ppm; zinc, 30 ppm, bromine, 0.4 ppm; arsenic, 30 ppb; and cadmium, 0.4 ppm. Other elements observed in most of the samples were: antimony, 5-100 ppb; gold, 2-5 ppb; lanthanum, 1-20 ppb; rhenium, 0.5-5 ppb; rubidium, 0.06-4 ppm; and selenium, 0.1-2 ppb. Trace element concentrations varied with species and lake. Uranium and thorium varied with species, but not for the same species from different lakes. The levels of copper, cobalt, zinc, and bromine varied little between species and lakes. The concentration of cadmium, arsenic, and chromium varied between species and with species between lakes. (Sjolseth-Washington)

INFLUENCE OF PENTACHLOROPHENOL ON FATTY ACIDS OF COHO SALMON (ONCORHYNCHUS KISUTCH),
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
D. Hanes, H. Krueger, I. Tinsley, and C. Bond.
Proceedings of the Western Pharmacological Society II, p 121-125, 1968. 2 fig, 2 tab, 3 ref. PHS Grants 1T1 GM 1192 and EF 105.

Descriptors: Animal metabolism, *Fish physiology, *Biochemistry, Water pollution effects, *Lipids, Toxicity, Growth rates, Length, Mode of action, Fish diets, Laboratory tests.
Identifiers: Coho salmon, *Pentachlorophenol, *Fatty acids, Catabolism, Fatty acide methyl esters, Metabolic rate.

Control salmon catabolized 25% of their available fatty acids (mass in diet plus mass in Day 0 salmon) over a 14-day period compared to 47% in KPCP poisoned salmon. Individual fatty acids showed a tendency to be either lost or conserved due to their different rates of net catabolism. The tendency of each acid to be lost or conserved was the same in both untreated and KPCP (potassium pentochlorophenal) poisoned salmon. The excess net catabolism of each fatty acid in salmon under KPCP poisoning was directly proportional to the available mass of that fatty acid. (Sjolseth-Washington)

INFLUENCE OF OXYGEN CONCENTRATION ON THE GROWTH OF JUVENILE COHO SALMON,
Oregon State Univ., Corvallis. Dept. of Fish and Game Management.
Robert B. Herrmann, Charles E. Warren, and Peter Doudoroff.
Transactions American Fisheries Society, Vol. 91, No. 2, 1962, p 155-167. 3 fig, 2 tab, 15 ref. PHS Grant RG 4352.

Descriptors: *Oxygen requirements, Dissolved oxygen, Mode of action, Water temperature, Laboratory tests, *Growth rates, Mortality, Animal metabolism, Water pollution effects, Fish physiology, Fish management, *Bioassay, Lethal limit, Fish-kill, *Fish behavior.
Identifiers: *Coho salmon, *Food consumption rates, *Food conversion rates.

Juvenile coho salmon were held at 20 deg C. in 12-gallon bottles, usually 10 to a bottle, in continuously renewed fresh water having various dissolved oxygen concentrations. In most of the experiments, the fish were fed beach hoppers to repletion twice daily so that food was available for 10 hours each day. Growth and food consumption rates of age-class 0 juveniles observed in the year 1956 declined slightly with reduction of oxygen concentration from a mean of about 8.3 to 6 and 5 mg/l, and declined more sharply with further reduction of oxygen concentration. Food conversion ratios were slightly depressed at concentrations near 4 mg/l, and were markedly reduced at lower concentrations. At concentrations averaging 2.1 to 2.3 mg/l, many fish died and surviving fish consumed very little food and lost weight. Interesting seasonal variations were noted of the dissolved oxygen requirements of coho salmon, their food and oxygen consumption rates, and their gross food conversion efficiencies. The conversion efficiencies apparently increased, whereas food consumption rates declined in the fall of 1956. The seasonal variations are not ascribable entirely to size differences. (Katz-Washington)

THE INFLUENCE OF OXYGEN CONCENTRATION ON THE SWIMMING PERFORMANCE OF JUVENILE PACIFIC SALMON AT VARIOUS TEMPERATURES,
Oregon State Univ., Corvallis. Dept. of Fish and Game Management.
Gerald E. Davis, Jack Foster, Charles E. Warren, and Peter Doudoroff.
Transactions American Fisheries Society, Vol. 92, No. 2, 1963, p 111-124. 5 fig, 2 tab, 18 ref. PHS Grant RG 4352.

Descriptors: *Chinook salmon, *Oxygen requirements, Dissolved oxygen, Laboratory tests, *Fish physiology, Fish behavior, Swimming, Water temperature, Oxygenation, Laboratory equipment, Animal metabolism, Water pollution effects, Thermal stress, Performance.
Identifiers: *Coho salmon, *Swimming performance, Hemoglobin content.

The sustained swimming speeds of juvenile coho and chinook salmon tested in a tubular chamber at temperatures ranging from 10 to 20 deg C. usually were dependent on the disolved oxygen concentration at any tried concentration below the air-saturation level. Reduction of oxygen concentration from air saturation levels to 7,6,5,4 and 3 mg/l usually resulted in reduction of the maximum sustained swimming speed of coho salmon by about 5, 8, 13, 20 and 30 percent, respectively. These percentages are based on the observed performance of the first-failing and second-failing individuals of a group of five fish used in a performance test. The corresponding estimated percent reductions of the swimming speed of first-failing fish in most of the early exploratory experiments with chinook salmon were somewhat greater, averaging approximately 10, 14, 20, 27, and 38 percent, respectively. Within the ranges of tested concentrations above the saturation levels, variations of oxygen concentration had little or no effect on the performance of wild underyearling and hatchery-reared yearling coho salmon. The performance of the wild underyearlings at tested oxygen concentrations improved progressively with increase of temperature from 10 to 15 and to 20 deg C. (Sjolseth-Washington)

RECOVERY OF A SALT MARSH IN PEMBROKESHIRE, SOUTH-WEST WALES, FROM POLLUTION BY CRUDE OIL,
K. J. M. Baker, and E. B. Cowell.
Biological Conservation, Vol. 1, No. 4, July 1969, p 291-295. 2 fig, 2 tab, 8 ref.

Descriptors: Resistance, Water pollution effects, *Salt marshes, Oily water, *Oil, *Marine algae, Water pollution sources, On-site data collections, *On-site investigations, Frequency, *Frequency analysis.
Identifiers: *Recovery, Oil spill, *Oil pollution, *Filamentous green algae, Halimone portulacoides, Suaeda maritima, Aster tripolium, Pembroke, South-west Wales.

entlass Salt Marsh, near Pembroke, south-west Vales, was polluted by Kuwait crude oil in January 967. Frequency data taken in June 1966, June 967, and June 1968, show that some species were ore affected than others by the oil. In June 1967, uaeda maritima, Salicornia spp., Halimione portu-coides, and filamentous green Algae, showed the eatest reduction of frequency, while Aster tripoli-n, Cochlearia spp., Triglochin maritima, Puc-nellia maritima, Juncus gerardi, Limonium hu-ile, and Spartina townsendii showed some reduc-on. At the time frequencies of Festuca rubra, Pan-go maritima, Armeria maritima, Artemisia aritima, Glaux maritima, and Spergularia spp., ere not significantly lower than the pre-spill vels. By June 1968 most of the species which ere affected in 1967 showed some recovery, the ception being Triglochin maritima, the ill-effect which had increased. The species with the eatest coverage, Festuca rubra in the upper arsh, Puccinellia maritima in the mid-marsh, and artina townsendii in the lower marsh, had all covered more or less completely by June 1968. jolseth-Washington)

entifiers: *Steelhead trout, *Water velocity, ize differences, Hatching size, Spawning success, tching time, Hatching success.

nbryos of steelhead trout and chinook salmon, re reared from fertilization of the eggs to tching at different constant oxygen concentra-ns and water velocities. Measurements of the nbryos and hatched fry indicate that water veloci-s must be high enough not only to transport ough oxygen to the redd for supplying the total quirement of all embryos, but also to deliver suf-ient oxygen to the surface of the chorion en-loping the individual embryo. Steelhead embryos ld at 9.5 deg C. and chinook salmon embryos ld at 11 deg C. all died at an oxygen concentra-n of 1.6 mg/l. Survival of large percentages of bryos reared at concentration as low as 2.5 mg/l s apparently made possible by reduction of piration rates and consequent reduction of owth and development rates. Sac fry from emb-s reared at low and intermediate oxygen con-ntrations were smaller and weaker than sac fry m embryos reared at high concentrations. The e of steelhead trout and chinook salmon fry at tching probably was dependent on water velocity en at velocities as high as 740 and 1,350 cm/hr, pectively, and on oxygen concentration even at ncentrations near saturation levels. RGANOCHLORINE INSECTICIDES IN RAIN-OW TROUT FROM THREE NORTH ISLAND KES,
partment of Agriculture, Wellington (New Zea-d). Wallaceville Animal Research Center.
R. B. Solly, and Valerie Shanks.
w Zealand Journal of Marine and Freshwater search, Vol. 3, No. 4, December 1969, p 585-0. 4 tab, 8 ref.

Descriptors: *Pesticide residues, Rainbow trout, Gas chromatography, *DDT, Chlorinated hydrocarbon pesticides, *Heptachlor, *Dieldrin, Water pollution effects, On-site data collections, Surveys, Analytical techniques.
Identifiers: *DDD, *DDE, *New Zealand, *Lindane, *Heptachlor epoxide, Rotorua.

From 12 rainbow trout (Salmo gairdneri Richardson) taken from each of three lakes, (Rerewhakaaitu, Opouri and Okataina) in the Rotorua district, N. Z., samples of liver, skeletal muscle and, from mature fish, the gonards were examined for organochlorine insecticides. Lindane, Heptachlor and heptachlor epoxide were not detected in any of the samples. Traces of dieldrin were detected only in trout taken from Rerewhakaaitu Lake. In all fish examined, pp'-DDT, pp'-DDD and pp'-DDE were detected all three tissues. The highest concentrations were found in some of the ovaries of fish from Rerewhakaaitu Lake, the catchment area of which had been extensively topdressed with DDT. Although most of the catchment area of Lake Okataina had never been topdressed with DDT, fish from this lake contained small amounts of DDT and its metabolites. (Sjolseth-Washington)

WATER TEMPERATURE CONTROL WEIR FOR MERAMEC PARK DAM, MERAMEC RIVER, MISSOURI,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Joseph P. Bohan.
U.S. Army Engineer Waterways Experiment Station, Technical Report H-70-1, Feb. 1970. 32 p, 4 fig, 6 photo, 7 plates.

Descriptors: *Temperature control, *Stratified Flow, Hydraulic models, Thermocline, Water temperature, Weirs, Control Equipment, Water quality control, Withdrawal.
Identifiers: *Meramec Park Dam.

Tests were conducted on a 1:40-scale model of the water temperature control weir for the Meramec Park Dam to investigate the discharge characteristics of the weir and determine its effectiveness in preventing the release of cold water from the hypolimnion. The model consisted of a section of the approach channel, the control weir, and the intake structure. Density stratification caused by temperature differentials in the prototype was simulated in the model by using saline and fresh waters. The weir was found to be effective for containing the cold water during release of desired rates of flow of 131 to 1028 cfs from the water supply and water-quality control (joint use) pool (el 608.0 to 675.0). Some withdrawal of cold water (approximately 7 percent) was observed with a discharge of 8000 cfs and a pool elevation of 680.0. The results of this study and similar tests on the Clarence Cannon and West Point water temperature control weirs were used to develop a preliminary, generalized technique for predicting the effectiveness of submerged weirs. ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS,
Cornell, Howland, Hayes and Merryfield, Portland, Oreg.
Donald M. Marshe.
In: Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows', p 57-106, June 22-23, 1970. 13 figs, 6 tab, 2 ref. FWQA Contract 14-12-128.

Descriptors: *Primary treatment, *Storm flow, Sewers, Overflow, Sewage treatment, Estimated cost.
Identifiers: *Screening, Combined sewer systems.

This study sought to determine the feasibility, effectiveness, and economics of employing high-rate, line-mesh screening for primary treatment of storm water overflow from combined sewer systems. The final form of the screening unit stands 63 inches high and has an outside diameter of 80 inches. The unit is fed by an 8-inch pipe carrying 1700 gpm (122 gal/min/ft sq) which is distributed to a 60-inch diameter rotating (60 rpm) stainless steel colar screen having 14 square feet of available screen area and a 165 mesh (105 micron opening, 47.1 percent open area). The screen is back-washed at the rate of 0.235 gallons of backwash water per 1000 gallons of applied sewage. Based on final performance tests run on dry-weather sewage, the unit is capable of 99 percent removal of floatable and settleable solids, 34 percent removal of total suspended solids and 27 percent removal of COD. The screened effluent is typically 92 percent of the influent flow. On the basis of a scale-up design of a 25 mgd screening facility, the estimated cost of treatment is 22 cents/1000 gallons. No finite cost comparisons were made with other treatment methods; however, when compared to conventional primary sedimentation, the selection of a screening facility as a treatment method is dependent on the value and availability of land, the design capacity of the treatment facility, the character of rainfall and runoff, and the means of disinfection. It was observed that the proposed screening facility required 1/10 to 1/20 the land required by a conventional primary treatment plant. (See also W70-09558). (Marriott-Chicago)

ASSESSMENT OF COMBINED SEWER PROBLEMS,
American Public Works Association, Chicago, Ill.
Richard H. Sullivan.
In: Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows', p 107-121, June 22-23, 1970. 8 fig.

Descriptors: *Storm drains, *Sewers, *Overflow, *Regulation, Regulated flow, Water pollution, Water pollution control, Water pollution treatment, Infiltration, Water quality, Maintenance, Hydrology.
Identifiers: Combined sewers, Regulators.

Problems of combined sewers are discussed generally and specific attention is given to problems of the combined sewer regulator and the capacity of the treatment plant. A recently conducted study of combined sewer system overflow regulator facilities and practices covering design, application, construction, control and operation and maintenance procedures, is detailed. The specific purpose of this project was to analyze and evaluate the effectiveness of practices and to establish long-needed guidelines for more efficient and dependable control of overflows and for reduction in the frequency and duration of combined sewer flows and the resultant pollution in waters receiving such spills. The function of a regulator is to regulate or control the amount of the flow which is allowed to enter the interceptor system and to divert the balance to holding or treatment facilities, or to discharge this balance to a point of disposal in nearby receiving waters. The study of combined

sewer regulators involved interviewing a group of jurisdictions and then in cooperation with a panel of consulting engineers preparing a report and a manual of practice. Of the seventeen jurisdictions only three were found to operate regulators designed to minimize pollution by assuring that the interceptor sewer is fully charged. These were in Seattle, Minneapolis-St. Paul, and Detroit. Some of the major findings and recommendations of the study call for a reduction in the number of overflows, total systems management of the combined sewer system, use of dynamic type regulators to allow response to hydraulic conditions in the sewers, use of regulators that improve the quality as well as the control of its quantity and the need for improved maintenance and design of regulator facilities. Infiltration control is also discussed briefly. (See also W70-09558). (Marriott-Chicago)

THE USE OF SCREENING/DISSOLVED-AIR FLOTATION FOR TREATING COMBINED SEWER OVERFLOWS,
Rex Chainbelt, Inc., Milwaukee, Wis.
Donald G. Mason.
In: Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows,' p 123-138, June 22-23, 1970. 9 fig, 4 ref. FWQA Contract 14-12-40.

Descriptors: Water pollution treatment, Flotation, Flocculation, Storm drains, Overflow, Urbanization.
Identifiers: Screening/flotation system, Milwaukee, Wisconsin.

The treatment of combined sewer overflow by screening and dissolved-air flotation was studied. The objectives were to determine the effectiveness and cost of a screening/flotation system. A combined sewer (Hawley Road) in Milwaukee, Wisconsin was monitored and laboratory testing which included screening, chemical oxidation, and dissolved-air flotation was performed. The results of the tests indicated a combination of screening flotation provided a feasible system and a prototype demonstration unit with a 5 mgd capacity was designed and installed. The system has been operated on 30 overflows. Removals of BOD, COD, SS, and VSS have been in the range of 50-75%. The waste solids stream has averaged only about one per cent by volume of the raw feed water. Operation has been very satisfactory with a minimum of maintenance required. Chemical flocculants have been utilized to increase the removal efficiencies to the upper values of the above range. Cost estimates have been made and these indicate a total installed cost of $12,000 per mgd capacity. Operating costs are estimated at 1.0cents/1000 gallons without chemical flocculant addition. Chemical costs should be in the range of 2.0-2.5cents/1000 gallons. Based on the results of this study screening/flotation offers an alternate to sewer separation in some areas. The project is scheduled for completion in early summer 1970. (See also W70-09558). (Marriott-Chicago)
W70-09618

UNDERFLOW PLAN FOR POLLUTION AND FLOOD CONTROL IN THE CHICAGO METROPOLITAN AREA.
Metropolitan Sanitary District of Greater Chicago, Ill Dept of Public Works and Buildings.

In Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows,' p 139-218, June 22-23, 1970. 20 fig, 9 tab, 8 ref.

Descriptors: *Underground storage, *Underflow, Sewers, Water pollution control, Flood control, Water storage, Storm runoff, Underground structures, Construction, Tunnels, Permeability, Dolomite, Limestone, Tunneling machines.
Identifiers: Underflow-storage Plan, Deep Tunnel Plan, Chicago Drainage Plan, Chicagoland area.

To solve the problems of flooding and water pollution in the Chicagoland area, a number of plans have been proposed and studied. Three of these plans, the Underflow-Storage Plan, the Deep Tunnel Plan and the Chicago Drainage Plan, are still viable alternates for the total solution to meet the water quality standards established by the state and Federal Governments and the requirements of handling the runoff from a 100-year storm. During the study of the Underflow-Storage Plan, it was decided to modify a large relief sewer proposed by the City of Chicago, as an Underflow Sewer similar to the metropolitan area-wide plan but on a much smaller scale. The Underflow Sewer would be constructed in solid rock, 250 feet below the ground surface. This sewer as well as two additional Underflow Sewers are under construction by the Metropolitan Sanitary District at widely separated locations in the Chicago area in the same dolomitic limestone rock formation. Construction of these sewers has confirmed the structural integrity and dense impermeability of this underlying rock blanket throughout the entire Chicago area. Further evaluation of the three plans indicates that portions of the Underflow-Storage Plan designated for the First Phase construction are compatible with further extensions along the general conceptual lines of any of the three plans. It is recommended that the final design of the First Phase work proceed and that all alternates for the Second Phase be thoroughly and systematically studied concurrently to determine the final plan. (See also W70-09558). (Marriott-Chicago)

SURVEY OF WATER UTILIZATION AND WASTE CONTROL PRACTICES IN THE SOUTHERN PULP AND PAPER INDUSTRY,
North Carolina Water Resources Research Inst., Raleigh.
Peder J. Kleppe, and Charles N. Rogers.
Available from the NTIS as PB-194 053, $3.00 in paper copy, $0.65 in microfiche. Report No. 35, Water Resources Research Institute of the University of North Carolina, June 1970. 77 p, 11 tab, 5 fig, 3 ref, 3 append. OWRR Project A-036-NC (1).

Descriptors: Pulp and paper industry, *Pulp wastes, *Industrial wastes, Water pollution sources, Water use industrial, *Water utilization, *Industrial plants.

The state of water usage and water pollution abatement in the Southern Pulp and Paper Industry was studied by surveying forty-six mills which produce about 60% of the total pulp and paper output of this region. The study covered use and treatment of fresh water, reuse of water in the mills, the amount of waste water and pollutants, waste treatments, and sludge disposal. The amount of waste water from the surveyed mills amounted to about 1,200 million gallons per day containing about 2.5 million pounds of BOD which was reduced to about 1.3 million pounds after treatment. Six areas of research are recommended: (1) Optimization of waste management; (2) Optimum reuse of process water; (3) Development of economical and non-polluting pulping and bleaching processes; (4) Obtaining completely closed water systems in pulp and paper mills; (5) Improvement of the present primary, secondary, and tertiary waste treatment processes, and the utilization of the products from these processes; and (6) Developing nonpollutant and economically feasible recovery processes for fibers from waste paper and board.

PHILADELPHIA'S PLANS TOWARD INSTRUMENTATION AND AUTOMATION OF THE WASTE WATER TREATMENT PROCESSES,
Philadelphia Water Dept., Pa.
C. F. Guarino, and G. W. Carpenter.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 11 p, 4 fig, 1 tab, 8 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Instrumentation, *Automation, *Programs, Mathematical model, Computers, Information retrieval, Data processing.
Identifiers: *Philadelphia, Pennsylvania, *Flow diagram.

For the past several years, the City of Philadelphia has been working towards the instrumentation and automation of the Northeast Water Pollution Control Plant. The plant is designed to treat 175 MGD with a combined average suspended solids and biochemical oxygen demand removal of approximately 75%. The data logging program named 'Nelog', which has been in use since January 1967, reduces the time required for record keeping, minimizes human errors, and enables analysis of data which would be impractical if attempted manually. The computer generates a monthly operational report as well as a monthly summary and an annual report. The Nelog program evaluates the data and produces an output listing any deviation from that which is considered normal or acceptable. This report is brief and enables the technical personnel to review and/or reject questionable data. The Philadelphia Water Department conceived a master plan for the automation of the Northeast Water Pollution Control Plant entitled 'NE-PAT', Northeast Plant Automated Treatment. The initial phase includes all the necessary steps leading to a digital computer system installed on line at a secondary waste water treatment plant. Data that will be collected by the system shall include dissolved oxygen, total suspended solids, turbidity, BOD, TOC, COD, sludge volume index, nutrients (N and P both Total and Ortho) CO2, CH4, total dissolved solids (effluent) and settleability of sludges. (Hancuff-Texas)

EXTENDABLE SEWAGE PLANT IN PACKAGE TYPE CONSTRUCTION FOR RAPIDLY EXPANDING COMMUNITIES UP TO 25,000 INHABITANTS,
Technische Hochschule, Aachen (West Germany). Institut fuer Siedlungswasserwirtschaft.
B. Boehnke.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 7 p, 6 fig.

Descriptors: *Sewage treatment, *Waste water treatment, Organic loadings, *Activated sludge, Stabilization.
Identifiers: *Package plants.

The problems of waste water disposal in small and medium sized communities requires reliable sewage plants which could be easily overloaded in the case of quickly or rapidly growing communities. It must be possible to hold within safe limits the disturbance to a waste water purification plant in agricultural drainage areas caused by liquid manure, farm wastes and other waste water shock. The technique described incorporates a ten fold increase in flow quantity in the case of rain and a five fold overload of the biological stage. For a quick improvement of many overloaded plants a typical development is shown which permits rapid design work and examination by the official local control bodies. The use of flat foundation ducts for the buildings permits the employment of local contractors and saves expense in excavation. Separation of the drive sets for sewage circulation and oxygen supply provides favorable energy economic ratios. The coupling of the oxygen supply with sludge return from the secondary clarification to the aeration basin also favors an economical use of energy. Building cost evaluations show a basic type treat-

ient for 1,000 to 5,000 inhabitants can be built at fairly reasonable expense. Further expansions up o 25,000 show expenditures which lie in the cost ange of ordinary compact sewage treatment lants. (Hancuff-Texas)

IRUS REMOVAL IN WASTE WATER ENOVATION BY CHEMICAL COAGULATION AND FLOCCULATION,
linois Univ., Urbana.
. Chaudhuri, and R. S. Engelbrecht.
ifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. reprint, 21 p, 10 fig, 7 tab, 56 ref.

escriptors: *Viruses, *Coagulation, *Flocculation, *Waste water treatment, Chemical precipitation, Colloids, Sewage treatment, Aluminum, Adsorption, Bacteriophage.
dentifiers: Waste water renovation, T 4 viruses, f1S2 viruses.

Viruses are colloidal particles and in domestic aste water many of them are of public health significance. Clarification by floc formation (coagulation of flocculation) and filtration removes a large raction of viruses from waste waters. Although ata on removal of viruses by coagulation flocculation are available, little attention has been given to he basic mechanism involved. Removal of viruses y chemical coagulation flocculation with alluminum sulphate comprises a primary instantaneous nert reaction between virus coat protein and aluminum which results possibly in the formation of oordination complexes between aluminum and he carboxyl group of the virus coat protein. This is ollowed by incorporation into the precipitating ydrated aluminum oxide species and subsequent locculation and sedimentation. The process of hemical coagulation flocculation cannot be exected to operate with high virus removal efficiency in waste water renovation, as compared to water reatment because of the presence of organic natter in waste water effluent. Virus particles emoved in the settled floc are not inactivated but emain active. Therefore proper care should be aken in the disposal of sludge from coagulation locculation operations in waste water renovation. (Hancuff-Texas)

ECHNOLOGY OF PLASTIC MEDIUM TRICKLING FILTERS,
Ruhrverband, Essen (West Germany).
. Rincke, and N. Wolters.
ifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. reprint, 9 p, 7 fig, 1 tab, 17 ref.

Descriptors: *Plastics, *Trickling filters, *Technology, Hydraulics, Biological treatment, Phosphorus, Films, Microorganisms, Microbiology, Waste water treatment.

Several influences and variables of the tricking ilter are discussed from an elementary point of iew. In preliminary studies filling materials with 225 to 270 m sq/m cu specific surface showed etter performance than those with 90 to 160 m q/m cu. At arising BOD load the amount of emoval substrate increases but not proportionally. At a constant loading the hydraulic feeds in principle can exert several influences on the removal: (1) a change in water quantity results in the reciprocal change of the substrate concentration, (2) the decrease of hydraulic feed can have the effect that at below a certain value the total wetting of the biological film is no longer achieved. A test program was carried out in which organic loading and hydraulic feed were varied independently of each other over wide ranges. Investigations at a constant feed 13.2 cubic meters per meter hour showed a continuous increase of removal with higher surface loading. However a maximum removal was not achieved under these test conditions. At a constant organic loading there were only slight differences in the removal of organics depending on the hydraulic feed rate. At constant organic loading there was no distinct relationship shown between the influent concentration and removal. Decreased efficiency of BOD removal was also shown when phosphorus was lacking. A MATHEMATICAL MODEL FOR CONTACT STABILIZATION-MODIFICATION OF THE ACTIVATED SLUDGE PROCESS,
Toronto Univ., (Ontario).
P. H. Jones.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 7 p, 4 fig, 4 ref.

Descriptors: *Mathematical model, *Activated sludge, *Sewage treatment, Waste water treatment, Absorption, Hydrolysis, Computer programs.
Identifiers: *Contact stabilization, Laboratory studies.

The contact stabilization modification involves the mixing of a well conditioned activated sludge with a fresh unsettled raw waste water for a brief period. During this period of contact the sludge removes organic and inorganic pollutants by several mechanisms. The major mechanisms involved are absorption, adsorption and simple physical entrapment. Removal is extremely rapid but the organic material is not stabilized in this reactor. The initial contact is therefore followed by a solid-liquid separation usually by settling and the sludge containing the unstable organics is then admitted to a sludge reaeration tank. It is hypothesized that the three removal mechanisms occur simultaneously and are described by various mathematical models. Adsorption and physical entrapment are physical reactions and a function of: (1) the particulate material, (2) velocity gradient, (3) mixing operation and (4) concentration of solids in the form of floc. The reaction is assumed to obey a first order differential equation. Absorption is assumed to obey the same equation as the growth of microorganisms. Another equation is defined for the hydrolysis of the material. A computer program was written incorporating these variables and validated through the use of laboratory tests. A mathematical model was postulated and the calculated and observed curves matched quite closely. The complete computer program is presented. (Hancuff-Texas)

DYNAMIC PROGRAMMING FOR A SEWAGE TREATMENT SYSTEM,
Yachiyo Engineering Co., Tokyo, (Japan).
T. Futagami.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 12 p, 11 fig, 2 tab, 2 ref.

Descriptors: *Sewage treatment, *Dynamic programming, *Systems analysis, Mathematical models, Standards, Optimization, Water quality, Waste water treatment.
Identifiers: Flow chart, Grid method.

An optimal sewage system is studied by using dynamic programming. This dynamic programming is based on the principle of optimality and has the advantage of being able to handle the complicated planning problems. A mathematical model of river system is constructed for the application of dynamic programming. The concentration of the polluted material in the river and the treatment rate at each municipal waste water treatment plant are chosen as the state variable and the decision variable respectively. The objective function considered includes the construction cost and treatment cost at each waste water treatment plant and chemicals' costs for water supply. Taking account of the purification of river, the functional equations are derived for the application of dynamic programming. The recurrence formulae are derived to obtain the optimal planning. Finally, dynamic programming is applied to the Yodo River System by using the derived recurrence formulae and grid method. In this research the backward calculation procedure of dynamic programming is adopted. (Hancuff-Texas)

SECONDARY TREATMENT WITH GRANULAR ACTIVATED CARBON,
Calgon Corp., Pittsburgh, Pa.; and Willard F. Schade and Associates, Cleveland, Ohio.
J. L. Rizzo, and R. E. Schade.
Water and Sewage Works, Vol 116, No 8, August, p 307-312, 2 tab, 4 ref.

Descriptors: *Adsorption, *Activated sludge, *Activated carbon, *Biochemical oxygen demand, Tertiary treatment, Biological treatment, Isotherm, Sludge, Digestion, Phosphate, Waste water treatment.
Identifiers: *Suspended Solids, Polymers, Raw Sewage Contact Time, Backwaste.

A new waste water treatment process using granular activated carbon has been successfully tested. Based on the results of demonstration studies, low cost of construction and less land requirement are claimed to be the two primary advantages of this method over the conventional biological secondary treatment processes. The present method is an outgrowth of a need to expand the capacity of an established treatment plant. The aforementioned plan if adapted, will give more room for future expansion. Some of the works done by various other agencies in the application of activated carbon are also discussed. Results obtained from other demonstration projects are presented. The final design features of the granular activated carbon system are outlined and the various aspects which will be investigated during the first year of operation are enumerated. OPTIMAL DEGREE OF SEWAGE WATER TREATMENT FOR EACH PROJECT OF THE COMPLEX,
State Water Conservation Inspection (USSR).
Y. P. Belichenko.
Fifth International Water Pollution Research Conference, San Francisco, July 26 - August 1, 1970. Preprint, 4 p, 2 fig, 1 tab.

Descriptors: *Sewage treatment, *Waste water treatment, *Optimization, *Efficiencies, Mathematical model, Water pollution, Cost.
Identifiers: Water uses, Purification.

Economic difficulties in solving the problem of conservation of water sources from pollution become especially evident if one takes into account the ever increasing quantities of sewage waters to be discharged in the future, and also the high construction costs of treatment works (averaging 100 roubles per cum. of wastes discharged per day), required to treat these increased discharges. Hence it follows how important it it to search for ways of decreasing construction and maintenance costs for decontamination of sewage waters. The relationship between construction costs of works for treating the sewage waters to different of purity is known. This relationship can be generally expressed as a function of initial and final concentrations of a pollutant and sewage discharge. After determining the required concentration of a certain matter contained in sewage effluents discharged into a water stream by each project on condition of providing the critical, admissable concentration of this matter at a downstream water use site with miminum expenses for construction of treatment works the required cost of each project can be evaluated through an optimization technique. A STUDY OF OPERATIONAL ANOMALIES IN DIGESTION TANKS,
Vattenbyggnadsbyran Ltd., Stockholm (Sweden).

N. Westberg, and B. Ericsson.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 9 p, 5 fig, 3 ref.

Descriptors: *Digestion, *Sludge treatment, *Digestion tanks, Circulation, Mathematical models, Waste water treatment, *Sewage treatment, Anaoerobic digestion.
Identifiers: *Digestion tanks, *Anomalies, Gas production, Gas removal.

Experimental runs have been carried out at the Jonkoping sewage plant, aimed at studying variation in the gas production cuased by intermittent feeding as well as intermittent pumping. At intermittent feeding the variations of the gas production during one day did not follow simple kinetic equations and showed two separate peaks, giving a picture of one primary and one secondary intensification of the gas production, thus indicating two successions of bacterial growth. On starting the circulation pump the gas production increased considerably and severe interference in the operation may arise, if the circulation rate is high enough. The intensity and durability of this increase depend upon the rate of circulation and the dimensions of the digester. Attempts have been made to develop mathematical formulae to describe the course of the variations. The calculated variations were greater than the experimental ones. Probably the deviations are primarily due to a very irregular flow pattern in the digester. The circulation flow seems to be concentrated in the central part of the digester. (Hancuff-Texas)

DEWATERING SEWAGE SLUDGE BY ELECTROOSMOSIS,
Rocketdyne, Canoga Park, Calif.
J. Greyson, and H. H. Rogers.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 14 p, 7 fig, 3 tab, 8 ref.

Descriptors: *Sludge, *Sludge treatment, *Sludge disposal, *Dewatering, *Electroosmosis, Costs.
Identifiers: Voltage, Power.

Electroosmotic pumping derives from the electrokinetic phenomenon of electroosmosis, i.e., the flow of water though porous matrices or constrained suspensions of fine particles that is associated with ion flow produced by an applied electric field. In contrast to conventional filtration, electroosmotic pumping is independent of the cross-sectional area of the pore structure of the filtering media and the inherent limitations of conventional filtration resulting from pore clogging or filter cake compression are removed. An investigation of electroosmotic pumping for dewatering sewage sludges to a solids level sufficient for autoincineration has been carried out, and it has been determined that the technique is applicable to sludges of various types. The most efficient dewatering is obtained when solids are collected from a screen cathode. For efficient dewatering from very wet sludge (2%) to burnable solids, it is necessary that an initial sludge film be formed at the cathode surface. Sludges cannot be thickened to a solids content exceeding 20% if the cake is beneath the liquid level of the sludge suspension; for drying beyond the 20% value, and cake must be brought out of the liquid. Preliminary cost estimates indicate that electroosmotic sludge dewatering is a potentially attractive unit process. (Hancuff-Texas)

HINDERED SETTLING AND THICKENING OF CHEMICALLY PRECIPITATED FLOCS,
Technical Coll. of Transport Engineering, Zillina (Czechoslovakia); and Hydraulic Research Inst., Brno (Czechoslovakia)
I. Tesarik, and J. Vostril
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 5 fig, 1 tab, 10 ref

Descriptors: *Settling velocity, *Chemical precipitation, *Flocculation, *Mathematical models, *Hydraulics, Turbulence, Fluids friction, Coagulation, Columns.

The problem of settling a layer of a concentrated suspension is rather important in water treatment but extremely difficult to solve. It is generally explained on the basis of Kynch's assumption. The flocs in the layer have various dimensions but, owing to the close packing, they sink at the same velocity. Kynch introduced the assumption that at any point in the dispersion the velocity of fall of a particle depends only on the local concentration of particles. Experiments with hindered settling were performed in a transparent column of internal diameter D=30 cm and total height h=250 cm. The experiments were performed with the chemical treatment of the raw water. Ferric chloride was the basic coagulant. The character of the suspended layer was varied by: (1) Changing the superficial velocity of fluidization (0.8 to 2.0 mm/sec). (2) Changing the water temperature. The Kynch equation u = a/ (M exp. alpha) was found to be applicable for suspensions of chemically precipitated flocs. It was concluded that the model tests of settling should be performed in a vessel of diameter 100 times greater than the floc dimension and the suspension height in the model and prototype should be equal. It was also concluded the relation between the velocity of settling and the total solids according to Kynch's theory is exponential; the exponent alpha is positive; its absolute value rises with the temperature and the coefficient a considerably increases with the content of suspended matters. ORGANIC AND LIQUID RETENTION TIME IN A TRICKLING FILTER FORMULATION,
West Pakistan Univ. of Engineering and Technology, Lahore (Pakistan).
M. I. Sheikh.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 8 p, 6 fig, 7 ref.

Descriptors: *Trickling filter, *Tracers, *Radioisotopes, *Sewage treatment, Formulation, Retention, Carbon radioisotopes, Depth, Filtration, Design, Pilot plants.
Identifiers: Glucose, Bromide 82.

In spite of its extensive use the design of filters has largely remained emperical and there is no commonly accepted theory of filter performance based on practical and theoretical grounds. Therefore fundamental research was made to study the influence of the many variables affecting the filter process. The investigations were divided into 2 phases: (1) liquid retention time studies on laboratory and pilot scale filters and (2) organic retention time studies on specially built experimental filters. Each pilot filter has an internal diameter of 6 feet and a total height of 11 feet and was operated at hydraulic loadings of 3570 and 140 gal/yd cu/day. The filter medium used was 2 inch stone with specific surface area of 23.8 ft sq/ft cu. The lab scale filters were 6 in. in diameter and 4 feet long, and were fed intermitantly at 5 minute intervals at the same loadings described above. They contained 3/4 inch and 1/4 inch sizes. The filter used for the organic retention time studies was an 18 inch diameter and a 6 foot depth reinforced concrete pipe; and was operated at a loading of 35 gal/yd cu/day. Br 82 was found to be the most suitable of the radio isotope tracers used for measurement of liquid retention time. Median time was found to be inversely proportional to the 0.87 power of the hydraulic surface loading and proportional to the filter depth and specific surface area of the filter medium. Up to 93% of the tracer carbon 14 was removed in about 30 minutes in the first foot of the filter. (Hancuff-Texas)

WASTE TREATMENT OPTIMIZATION BY GEOMETRIC PROGRAMMING,
California Univ., Irvine.
J. Scherfig, R. Schinzinger, and T. W. Morgan.
Fifth International Water Pollution Research Co
ference, San Francisco, July 26-August 1, 19
Preprint, 18 p, 17 ref.

Descriptors: *Sewage treatment, *Optimizatio
*Mathematical models, *Waste water treatme
Costs, Construction costs, Activated sludge, Slud
disposal, Aeration, Sedimentation.
Identifiers: *Geometric programming, Wet oxi
tion.

Geometric programming and two computer
gorithms for optimization of waste treatme
systems have been described. Mathematical mod
of waste treatment systems are classified as: (
Convex models; such models can be optimized
the convex problem algorithm. (2) Nonconv
models with few degrees of difficulty; these mod
can be optimized by the search algorithm. (3) No
convex models with many degrees of difficult
such models cannot be optimized by geometr
programming at the present time. A detailed mod
of a sludge treatment system including thickenin
aerobic digestion, wet oxidation, and ultima
disposal is presented and the optimum (i.e. lowe
annual cost) design of each unit determined for di
ferent constraints. The cost of computer time f
optimization is low (less than two minutes to
computer time) including compiling for the slud
treatment example and the algorithms are readi
adaptable to time sharing, thus geometric pr
gramming should become a very significant tool
routine engineering design. (Hancuff-Texas)

**THE pH TOLERANCE OF ANAEROBI
DIGESTION,**
New Mexico State Univ., Las Cruces.
R. H. Clark, and R. E. Speece.
Fifth International Water Pollution Research Cor
ference, San Francisco, July 26-August 1, 197
Preprint, 14 p, 10 fig, 3 tab, 27 ref.

Descriptors: *Hydrogen ion concentratio
*Digestion, *Anaerobic digestion, Toxicity
Methane, Fermentation, Acids, Sludge, Sludg
treatment, Sewage treatment, Waste water treat
ment, Chemical oxygen demand.

Eight laboratory anaerobic filters constructed fro
5.5 in. ID, 36 in. plexiglass columns filled with 1-
1/2 in. broken quartzite stone media were used t
study the effect of non-optimum pH on methan
fermentation. The reactor pH, methane produc
tion, and effluent Chemical Oxygen Demand
(COD) were the primary parameters measured
The pH levels between 3.9 and 9.3 were studied fo
durations of 12 hours to 21 days. Results showe
that: (1) Steady state acetate fermentation at pH
levels as low as 4 was possible, although at a rate
less than would be attained with the same reactor
and bacterial population in the optimum pH range
(2) Acetate fermentation in an anaerobic filter wa
not inhibited between pH 6 and 8. (3) The
recovery of acetate fermentation after a pH drop to
as low as 5.0 was complete and prompt if the drop
duration was less than 12 hours but required more
time than would be expected based on simple bac-
terial regeneration and was only pH dependent if
the drop duration exceeded 3 days. (4) A pH of 9
essentially stopped acetate fermentation, but
recovery was complete and prompt after optimum
pH levels were restored. (Hancuff-Texas)

SUBSTRATE FLOW IN ANAEROBIC DIGESTION,
National Inst. for Water Research, Pretoria (South
Africa).
D. F. Toerien, P. G. Thiel, and W. A. Pretorius.
Fifth International Water Pollution Research Con-
ference, San Francisco, July 26-August 1, 1970.
Preprint, 7 p, 7 fig, 19 ref.

Descriptors: *Digestion, *Anaerobic digestion,
*Anaerobic conditioning, *Sludge treatment,
*Flows, Waste water treatment, Sewage treatment,

Bacteria, Methane, Fermentation, Microorganisms.
Identifiers: Cells, Acetic acid.

The optimal utilization of anaerobic digestion is dependent on a knowledge of the mechanism of the process, since it forms the basis of kinetic evaluations of the process. Substrate flow in any biological treatment process depends on the organisms participating in the process, and proceeds at two levels namely, flow of substrate in single cells (intracellular substrate flow) and flow of substrate between cells (intercellular substrate flow). At least three different mechanisms might be involved in methanogenesis during anaerobic digestion. They are: (1) Single-step methanogenesis in which complex organics are decomposed directly to methane, (2) Dual-step methanogenesis in which intercellular substrate passes through the acid-forming and the methanogenic bacterial groups, and (3) Multi-step methanogenesis in which a symbiotic association of two bacterial species exists. The one attacks ethanol producing acetate and H2, while the other utilizes the H2 together with CO2, to produce CH4. It is concluded that if methanogenesis requires the activities of more than two groups of bacteria, another intermediate group of bacteria must exist in anaerobic digestion. The existence of such a group and its characteristics should be investigated. It is also concluded that although acetate is one of the major precursors of methane in anaerobic digestion, it is doubtful whether this reaction is 'growth-coupled'. This aspect should be investigated fully, since it is important in kinetic evaluations. (Hancuff-Texas)

KINETICS OF WASTEWATER CHLORINATION IN CONTINUOUS FLOW PROCESSES,
California Univ., Berkeley; and California State Health Dept.
R. E. Selleck, H. F. Collins, and G. White.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 11 p, 6 fig, 2 tab, 7 ref.

Descriptors: *Kinetics, *Chlorination, *Waste water treatment, *Sewage treatment, Flows, Mixing, Coliforms, Mathematical models, Ammonia, Tubes.
Identifiers: Tube reactor, Chlorine demand.

The effect of reactor mixing on the process performance of wastewater chlorination was studied in this investigation for the purpose of obtaining information which can be used to improve the performance of the process as well as to aid in its control. The significance of mixing in terms of process performance is illustrated. In one case an aqueous solution of gaseous chlorine was added to the head of a tubular reactor and in the second case directly to a completely backmixed tank reactor. The residence time in the tubular reactor was only 0.12 minutes while the mean residence time in the backmixed tank was 37.5 minutes. The overkill effected by the two methods of chlorination were radically different. The overkill was more than one order of magnitude greater than chlorine when applied to the tubular reactor. It is concluded from this study that the rate of kill appears to be independent of all factors except amperometric chlorine residual concentration and contact time (and possible temperature). It appears that some bactericidal action takes place as long as any detectable amperometric residual exists in the chlorinated waste water. The results also indicate that the bactericidal potential of the amperometric chlorine residual decreased with time. This indicated that the residual is composed of a number of different species of chlorine compounds which tend to cascade with time toward a less reactive species. (Hancuff-Texas)

KINETIC ASSESSMENT OF GLUCOSE REMOVAL AND SACCHARIDE ACCUMULATION CAPACITIES IN ACTIVATED SLUDGE,
Institute of Chemcial Technology, Prague (Czechoslovakia). Dept. of Water Technology.
M. Dohanyos, P. Grau, and J. Chudoba.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 5 fig, 12 ref.

Descriptors: *Activated sludge, *Kinetics, Sewage treatment , Waste water treatment, Enzymes, Microorganisms, Metabolism, Respiration.
Identifiers: *Glucose removal, *Saccharide accumulation, Sludge age.

Primary substrate removal capacity and primary saccharide accumulation capacity of activated sludge have been defined and their values assessed from glucose removal and cell saccharide build-up kinetic data. Dependence of both capacities on activated sludge age in a range from 1.25 to 30 days has been shown. The capacity ranged from about 20 to 400 ml of glucose (Or COD) per gram of initial activated sludge suspended solids depending on the sludge age and substrate composition. The glucose primary removal capacity (and also the accumulation capacity by analogy) depends also on the glucose proportion in the substrate on which the activated sludge is cultivated and on other components of a di-or, multi-substrate containing glucose as one component. As accompanying components glutamic acid and peptone were used in the study. One of the practical results of this study is a warning that synthetic sewage media based on glucose (and presumably even other saccharides) should not be used to obtain designed data unless this is justified by the actual composition of the waste. However it is felt that the relationships found in this study contribute toward understanding the basic characteristics of biological waste treatment. (Hancuff-Texas)
W70-09759

SURVEY OF SEWAGE UTILIZATION FOR AGRICULTURAL PURPOSES IN ISRAEL,
Israel Water Commission.
A. Feinmesser.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 4 tabs, 10 ref.

Descriptors: *Sewage treatment, *Agriculture, *Irrigation, Oxidation lagoons, Ponds, Oxidation, Crops, Water reuse, Water quality.
Identifiers: *Sewage disposal, Israel.

Discussion is presented on various means of sewage disposal for example: discharge to rivers and streams, discharge to sea, use for irrigation, disposal on dry river beds and treatment for reuse in urban areas. Results of a survey conducted in 267 settlements is tabulated and includes data on population, livestock and industry, quantities of waste sewered, quantities of water purified and the possibilities for reuse of sewage. The potential amount of reusable or usable sewage from the inspected settlements is 65,000 m cu/day. The amount being utilized was 42,000 m cu/day. A survey of urban sector was also conducted and covered 62 municipalities having a total population of 2,100,000. The sewage potential was 343,000 m cu/day. Of this amount about 84% or 287,000 m cu/day were sewered. Approximately 119,000 m cu/day of sewage or 42% of the sewered waste undergoes purification in treatment plants. Only 23% of the total urban sewage potential or 28% of the sewered waste representing 79,000 m cu/day are being utilized at present. Tabulation is presented of the crops irrigated with municipal sewage including the areas irrigated and the quantity of sewage utilized. The mineral concentration and the per capita contribution from towns and agricultural settlements is also tabulated. A short discussion is also presented on oxidation ponds and their increasing use for waste water in Israel. (Hancuff-Texas)
W70-09760

AERATED GRIT CHAMBER WITH TANGENTIAL INLET,
Technical Univ. of Prague (Czechoslovakia).
Z. Konicek, and I. Pardus.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 8 p, 8 fig, 7 tab, 7 ref.

Descriptors: *Aeration, *Energy, *Bubbles, *Flows, Inlets, Mathematical models, Velocity, Efficiencies, Circulation.
Identifiers: *Grit removal.

Spiral flow in an aerated grit chamber is produced by artificial aeration along its longitudinal wall. Components of both horizontal and cross velocity form a spiral current. The aeration should be strong enough to insure a final water velocity of 25 to 30 cm/sec 5-10 cm above the bottom of the chamber. The detention time at dry weather flow should be at least 1.5 min. The mean horizontal velocity in the grit should not exceed 30 cm/sec and the length of the chamber should correspond at least to a triple spiral. The hydraulic conditions of the chamber may be improved by the addition of a longitudinal baffle placed along the aeration system and the efficiency of the grit chamber can be enhanced by placing the water outlet in the center of the cross-sectional area. In analyzing the optimum conditions for grit removal design an energy balance is utilized and extensive mathematical munipulation are carried out. Results of calculations are compared with results obtained by direct measurement. In the tests made the detention time varied from 3.1 to 9 minutes and in all tests the optimum detention time proved to be approximately 7 minutes. Efficiency tests at different aeration intensities were also made varying the flow from 1.03 to 1.1 m cu/sec. The grit chamber without a baffle indicated the optimum aeration is approximately 40 Ncm cu/hour. (Hancuff-Texas)
W70-09761

THE INFLUENCE OF WASTE WATER CONCENTRATION ON THE ACTIVATED SLUDGE PROCESS EFFICIENCY,
Water Economics Research Inst. Warsaw (Poland).
J. Ganczarzyk, and S. Bachanek.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 4 fig, 2 tab, 7 ref.

Descriptors: *Activated sludge, *Sewage treatment, Efficiency, Mathematical models, Chemical oxygen demand, Kinetics, Organic loading, *Waste water treatment.
Identifiers: Fiber Board.

Waste water from the production of fiberboard contains a complicated mixture of dissolved and colloidal organic substances which has a range of concentration from 7,300 to 42,000 mg/l COD. These are primarily colloidal carbohydrates and to a lesser extent furfurol, lower alphatic acids, alcohols, aldehydes and ketones. Dissolved oxygen levels of 1 to 2 mg/l were maintained throughout the experiments as well as a constant ratio of mineral nutrients to the BOD load with BOD:N:P equal 100:5:1. The pH was between 7 to 7.5 and the temperature was between 18 deg C and 20 deg C. The dependent variables in each experiment were: the concentration of the influent, suspended solids contained in the aeration tank (3.15 to 11.17 g/l), and the waste water aeration period (2.9 to 123 hours). The experimental results amounting to 660 separate measurements were statistically analyzed with the use of the Least Squares Method and calculated correlation factors were verified by the Students Test. These results were not interpreted either according to the Michaelis-Menten theory nor the two-phase hypothesis, but were generalized on the basis of the equation for a retardant reaction. It was concluded that under some conditions it is possible to use the activated sludge treatment even for very concentrated waste waters. (Hancuff-Texas)
W70-09762

OXYGEN UPTAKE AND MECHANISM OF SUBSTRATE PURIFICATION IN A MODEL TRICKLING FILTER,
Cornell Univ., Ithaca, N.Y.
P. Monadjemi, and V. C. Behn.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 16 p, 14 fig, 6 ref.

Descriptors: *Trickling filters, *Mathematical models, Depth, *Films, Slime, Dissolved oxygen filtration, Chemical oxygen demand, Sewage treatment, Waste water treatment, Oxygen demand.
Identifiers: *Oxygen uptake, Purification.

A mathematical formulation is presented modeling the activity of the trickling filter. The basic assumptions in the development of this formulation are: (1) the flow of each individual element approximated to be of cylindrical shape is laminar with molecular diffusion as the prevailing means of mass transfer in the liquid layer, (2) at the point of contact of each element with the one immediately above or below it mixing of the liquid occurs, (3) the available active surface of slime film and the quality of it is constant in each element and from element to element for the biochemical oxygenization is not rate determining, (4) the substrate used is in the form of soluble nutrient, (5) the filter elements are packed in cubical fashion, (6) the waste has only one single compound. The mathematical model developed shows that the log of the portion of the substrate remaining is a linear function of depth. The oxygen uptake model is developed based on the same or similar assumptions. A dissolved oxygen profile was obtained using glucose as a substrate. The oxygen uptake in the filter was in the order of 10 mg of O2 per hour per gram of slime film. Calculations for the top sections indicate that the uptake was about 13.6 mg O2 per hour per gram of slime film and for the bottom sections 7.1 mg O2 per hour per gram. (Hancuff-Texas)
W70-09763

SOME FACTORS AFFECTING THE EFFICIENCY OF HIGH-RATE BIOLOGICAL FILTERS,
Water Pollution Research Lab., Stevenage (England).
A. M. Bruce.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 8 p, 4 fig, 3 tab, 9 ref.

Descriptors: *Trickling filter, Films, Surfaces, Materials, *Biological treatment, *Filtration, Biochemical oxygen demand, Pilot plants, Sewage treatment.

Observations have been made over a 12 month period of the performances of six pilot scale biological filters containing different types of media. When receiving settled domestic sewage at a rate of 6 m cu/day the BOD removal efficiency of filters containing plastic sheet packings for mineral aggregate medium was related in a fairly consistant manner to the specific surface area provided by the medium. A tubular plastic medium demonstrated a lower efficiency than the other media in relation to the specific surface provided. The effect of temperature on performance was pronounced and the calculated value of the temperature coefficient was much greater than that which has been found in studies elsewhere. In analyzing the seasonal effects due to temperature changes the temperature coefficient C was found to range between 1.1 and 1.035 with a mean 1.21. This value was substantially greater than the value 1.035 normally applied to lightly loaded precolating filters. The temperature range of this study was between 18 deg C to 9 deg C which caused a fivefold change in oxygen uptake or substrate utilization. (Hancuff-Texas)

A MATHEMATICAL MODEL OF SELF-PURIFICATION PROCESS IN A CANALIZED HIGHLY POLLUTED RIVER,
Water Economics Research Inst., Wroclaw (Poland).
H. Manczak, and R. Kransnodebski.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 7 p, 2 tab, 6 ref.

Descriptors: *Mathematical models, *Rivers, *Self-purification, *Dissolved oxygen, Oxygen sag, *Biochemical oxygen demand, Water pollution, Reaeration, Kinetics.
Identifiers: *Suspended solids.

Results of research on the self-purification capacity of the Odra river along it's course of 264 km are utilized to construct a mathematical model for describing the oxygen sag curve. The research was based on hydrographic, hydrometric and hydronomic measurements. The measurements have been performed during four periods. In winter when the river was covered with ice, in winter when it was free of ice, in summer, and in autumn. The data namely BOD5 and DO obtained from these measurements served as a basis for construction for the mathematical model of the oxygen utilization process and of the dissolved oxygen curve. Three basic assumptions are made in the construction of this model: (1) the changes of pollution of oxygen content in the stream caused by waste water discharge by tributaries or by weirs are stepwise, (2) the changes of the flow of the stream caused by tributaries are stepwise also, (3) the reaeration coefficent is a function of BOD5, (4) in every interval the BOD process in deoxygenization are first order processes and constant. NEW DEVELOPMENTS IN THE DESIGN OF ACTIVATED SLUDGE TANKS WITH LOW B.O.D. LOADINGS,
Dwars, Heederik, and Verhiey Ltd., Amersfoort (Netherlands).
J. Zeper, and A. De Man.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 10 p, 11 fig.

Descriptors: Design, *Activated sludge, *Organic loading, *Biochemical oxygen demand, Energy turbulence, Aeration model studies, Testing, Mathematical models, Efficiency, Prototypes.
Identifiers: Carrousel tank, *Aeration tank.

In the activated sludge tanks the energy needed to keep sludge floc in suspension amounts to 15 to 25 watts/m cu. With BOD loadings below 1 kg/m per day this value often exceeds the energy needed for oxygen transfer. In oxidation ditches with BOD loadings as low as 0.2 kg BOD/m day sludge floc are kept in suspension by the uniform turbulent flow in the ditch. The 5 to 8 watts/m cu needed for oxygen transfer by cage rotors are sufficient to generate suspension turbulence in the ditch. Model tests have shown the feasibility of generating an adequate uniform turbulent flow in oxidation ditches using surface aerators with a vertical axis. The tests on a prototype oxidation ditch with 3,500 m cu liquid content proved the possibility of this arrangement. This new type of activated sludge tank, the Carrousel tank, combines the advantages of high oxygen transfer efficiency and a confined aeration zone adapted to the size of the aerator. With low energy demand for suspension of sludge floc in flow channel within the tank 3 to 5 watts/m cu were found to be sufficient. Design data are given for Carrousel tanks now under construction. Among these are three large oxidation tanks of 19,000 m cu each, as well as an activated sludge plant with 4 tanks of 2,900 m cu each. (Hancuff-Texas)

TURBULENCE DIFFUSIVITY IN ACTIVATED SLUDGE AERATION BASINS,
Utah Water Research Lab., Logan.
A. A. Kalinske.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 16 p, 3 fig, 24 ref.

Descriptors: *Turbulence, *Diffusivity, *Activated sludge, *Aeration, Waste water treatment, Biological treatment, Energy, Mass transfer, Mathematical model, Kinetics.
Identifiers: Aeration basins, Agitation, Floc Gradients.

In the study of complex turbulence fields in activated sludge aeration basins one must consider the parameters which are pertinent to the particular process that is being considered. No overall general average characterization of the turbulence in such basins is of much value. The customary criteria of energy input (average velocity gradients) as calculated from the power input is not sufficient to characterize the turbulence involving air bubbles and floc matricies. Of greater importance are the turbulence intensities usually expressed as the mean square velocity function and the energy dicipating eddies, as shown by a turbulence spectrum. High intensity in small scale eddies of a size comparable to the floc will increase the various process transfer rates by increasing the applicable diffusivity and by floc disintegration to expose as much of the microbial surface as possible. Diffusers are reported to have inherent limits so far as controlling the intensity and scale of the turbulence are concerned, and mechanical means such as turbines are suggested to generate high localized fluid shear and large amounts of microturbulence. This is considered to be of particular importance where oxygen enriched air or pure oxygen may be used for treating strong wastes maintaining high values of DO or using high concentrations of suspensions. GENESEE COUNTY, MICHIGAN PUBLIC WORKS PLAN FOR WATER POLLUTION CONTROL.
Consoer, Townsend and Associates, Flint, Mich.

Engineering report to Genesee County Drain Commissioner, Flint, Michigan, January 1970. 104 p, 30 fig, 3 tab. HUD Project No. P-MICH 3241.

Descriptors: *Sanitary engineering, *Sewers, *Sewage treatment, *Long term planning, *Urbanization, *Water resources planning, *Programs, *Coordination, *Pollution abatement, *Water pollution control, *Waste water treatment, Municipal wastes, Construction costs, Operating costs, Project planning.
Identifiers: *Sanitary sewers, Public works planning.

A county-wide public works plan is described for water pollution control in Genesee County, Michigan. The plan for sewers and sewage treatment was initiated by the County Drain Commissioner in anticipation of potential problems from expansion of service areas, relief sewer requirements, flows from outside Genesee County, and overloads on present waste water treatment facilities. The purpose of the plan is to provide a sanitary sewerage system designed to handle ultimate needs when the County and contiguous tributary area attain full development. All existing sewer systems and future construction would ultimately be merged into an integrated system. At present, the City of Flint provides waste water treatment for County flows from one of six County sewage disposal districts. Two alternative plans are presented for sewage disposal. One is to continue the agreement with Flint and participate in plant expansion. The other is to expand the capacity of a county treatment plant and construct the trunk sewer necessary for flow diversion. Descriptions of recommended improvements, expansion and additions to the sewer systems and waste water treatment facilities, together with estimates of construction costs and operating costs, are included. Methods of financing are discussed. (Poertner)

COMMUNITY ACTION PROGRAM FOR WATER POLLUTION CONTROL.
National Association of Counties Research Foundation, Washington, D.C.

July 1967. 182 p, 65 fig, 2 tab, 73 ref. FWPCA Demonstration Grant WPD 55-04-67.

Descriptors: *Water pollution control, *Local governments, *Programs, *Community development, *Urbanization, *Municipal wastes, *Pollution abatement, *Legislation, *Planning, *Financing, *Treatment facilities, *Waste water treatment, *Water quality control, Sewage treatment, *Project planning, Administration, Personnel management, Training, Compensation, Administrative agencies, Operation and maintenance, Design, Sewerage, Sewers, Construction.
Identifiers: *Community action programs, *Guidelines, Organization, Implementation programs.

Ten community action guides for water pollution control are presented to provide policy-making officials of local governments with guidelines on all aspects of planning, design, organization, financing and operation of programs to prevent and abate water pollution. The information was obtained from officials in nearly 60 communities with successful anti-pollution programs. The ten action guides, each presented as a chapter of the publication, are: Enabling Legislation for Pollution Control Programs; Area-wide Approach to Pollution Control Programs; Planning Pollution Control Programs; Organization of Pollution Control Programs; Construction of Collection and Treatment Facilities; Financing of Pollution Control Programs; Technical and Financial Assistance Available to Localities; Gaining and Maintaining Public Acceptance for Pollution Control Programs; Staffing Pollution Control Facilities; and An Action Plan for Instituting Community Pollution Control Programs and Bibliography of Pollution Control Literature. These action guides are designed to be useful to community leaders, local officials, engineers, managers, finance experts, attorneys and others who have responsibility for portions of a total pollution control program. Illustrations and photographs are included. (Poertner)

RESEARCH AND PRACTICE IN ANIMAL WASTES TREATMENT,
Lilly (Eli) and Co., Lafayette, Ind. Tippecanoe Labs.
Robert H. L. Howe.
Water and Wastes Engineering/Industrial, Vol 6, No 1, January 1969. p A14-A18, 6 fig, 7 tab, 6 ref.

Descriptors: *Animal wastes, *Waste treatment, *Waste water treatment, *Industrial wastes.
Identifiers: *Packing house wastes, Population equivalents.

In recent years, the problem of animal and dairy wastes has grown larger due to increased demands for more effective control of wastes discharges to streams and due to the increased demand for more food to feed our ever growing population. BOD content of various animal wastes were studied and it was found that cattle produce 6.5 lbs BOD/day or 27 times the amount produced by humans, which was found to be 0.17 lbs/day. Hogs produce 0.85 lbs BOD/day and chickens, 0.07 lbs BOD/day. Experience indicates solid and liquid wastes should be handled separately for reasons of economy. Traditional methods of disposal and treatment were observed, and some research was conducted in physical and chemical methods of treatment, especially in the area of coagulation. Animal processing wastes were found to require solids separation and recovery before treatment by conventional means. Listings of the processes used and flow charts are given to illustrate the treatment of the animal processing wastes. It is recommended that further research in treatment and handling of animal wastes, and improvement of efficiency and economy of treatment be made. Segregation of wastes and recovery of by-products are also recommended as ways to increase economy. (Makela-Texas)

CATAD SYSTEM CONTROLS FOR REGULATION OF COMBINED SEWAGE FLOWS,
Charles V. Bibbs, and Stuart M. Alexander.
Water and Wastes Engineering, Vol 6, No 8, August 1969. 66-69 p, 2 fig, 1 tab.

Descriptors: *Automatic control, *Telemetry, *Remote control, Mathematical models, Treatment plant.
Identifiers: *Collection systems, *Interceptions, *Combined sewers, Trunk sewer, Outfalls, Pumping stations, Digital counter.

Combined sewers are designed to utilize the maximum storage during periods of high flow. A computer augmented treatment and disposal system (called CATAD) proposed for the municipality of metropolitan Seattle is described. This program enables the minimization of the overflow of combined sewage. Existing local station controls and the principal objectives of the system controls are outlined. The paper also describes how the desired degree of control is achieved by the new system. Various components of the system and their primary functions are presented. A description of a mathematical model which will automatically control the system is presented. Apart from acting as a control for the combined sewage flow, the system also does recording and storing of water quality data for later analysis. The system has a good capability for future expansion. (Radhakrishnan-Texas)

FEDERAL PROGRAMS STUDY WASTES FROM RAW AGRICULTURAL PRODUCTS,
Agricultural Research Service, Washington, D.C.
Sam R. Hoover.
Industrial Wastes, Vol 116, No 11, November 1969, p 22-25. 2 tab, 4 ref.

Descriptors: *Environment, *Wastes, *Domestic wastes, *Biochemical oxygen demand, *Solid wastes, By-products, Tertiary treatment, Incineration, Water pollution.
Identifiers: *Population equivalent, *Agricultural processing wastes, Molasses, Land disposal, Food processing plants, Salt water intrusion.

The direct and indirect effects of agricultural wastes on pollution of the environment are discussed. Attempts made by various agencies to assess the magnitude of the problem are outlined. Various methods by which pollution from agricultural products can be minimized include food processing methods, methods of harvesting, improved methods of peeling vegetables, efficient separation and removal of solid wastes from processing stream, new processing methods and recovery of by-products. Some of the effects of controlling pollution are also mentioned. Out of the various recommendations made to improve control of agricultural pollution the broad and specific areas where research needs to be done are also pointed out. The main purpose of the research will be to know to what extent the improved methods can minimize pollution from agricultural wastes. Finally the research programs undertaken by the various federal agencies to control pollution arising out of wastes from agricultural products are presented. (Radhakrishnan-Texas)

DISPERSED AIR FLOCCULATION/FLOATATION FOR STRIPPING OF ORGANIC POLLUTANTS FROM EFFLUENTS,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. Van Vuuren, G. J. Stander, M. R. Henzen, S. H. V. Van Blerk, and P. F. Hamman.
Water Research, Vol 2, No 2, February 1968. 177-183 p, 3 fig, 1 tab, 5 ref.

Descriptors: *Sewage effluent, *Dissolved oxygen, *Flocculation, Adhesion, Aeration, Ponds, Lagoons.
Identifiers: *Organic pollutants, *Floatation, *Activators, *Humus tank, Retention period, Maturation pond.

Basic principles underlying dissolved air and dispersed air floatation techniques are discussed. Some methods used by other investigators for dispersed air floatation technique are also presented. A small scale dispersed air floatation unit which was developed for separating organic pollutants from sewage effluents is described. A modified dispersed air generating system was developed by the suction of air into the pump impeller. This technique is advantageous in that it avoids high pressure floatation equipment. The laboratory scale unit was found useful to determine the basic design criteria for similar equipment to be used for a pilot-scale plant. (Radhakrishnan-Texas)

THERMAL TREATMENT OF SEWAGE SLUDGE,
A. Bjorkman.
Fourth International Congress of the International Research Group on Refuse Disposal, Proceedings, Based, June 2-5, 1969. N.P., N.D. p 682-686.

Descriptors: *Dehydration, *Incineration, *Sewage, *Sewage sludge, *Sludge treatment, Sludge, Sludge disposal.
Identifiers: *Hygienization, *Thermal treatment, Raw sewage, Chemical-thermal process.

Working Group Six of the 4th International Congress of the IRGR discussed four main issues of sludge treatment: hygienization, dehydration, drying, and incineration of sewage. The necessity for hygienization destroying the pathogenic germs in order that the sludge can be used in agriculture without any danger of infection was discussed. Problems concerned with use of sewage for irrigation were also discussed, for example groundwater pollution and heavy metal accumulation in soil. Thermal treatment for the purpose of dehydrating was evaluated emphasizing the exclusion of soil pollution, using drying beds, digestors or chemical admixtures as advantages. The discussion delt mainly with the problem of what treatment should be applied to the highly polluted effluent of dehydration. Multi-use plants for both drying and incineration were described. (Waid-Texas)

THERMAL TREATMENT OF SEWAGE SLUDGE,
A. Bjorkman.
Fourth International Congress of the International Research Group on Refuse Disposal, Proceedings, Bosel, June 2-5, 1969, N.P., N.D., 670-681 p.

Descriptors: *Dehydration, *Incineration, *Sludge, *Sewage, Oxidation, *Sludge treatment, Sludge disposal.
Identifiers: *Hygienization, *Thermal treatment, Raw sewage, Wet incineration, Fluidized bed.

Thermal treatment plays a growing role in the disposal of sewage sludge. It is used to pasteurized sewage for agricultural use. Hygienists recommend a temperature of 70 deg C for 20-25 minutes for pasteurization. Heat and pressure coagulate the solid materials contained in sludge, destroy the cell walls and release the strong binding of sludge water to solid materials. Treatment at 200 deg C and under 15 atmospheres pressure allows mechanical dehydration processes to obtain residual water content of 40-44%. Heat treatment is also applied in several drying processes such as multiple hearth dryers, drying drums, flash drying systems or a belt dryer. If the sewage cannot be used it can be incinerated and the smallest possible residues then disposed of. Fluidized bed incineration and wet incineration are described. Liquid or dehydrated sludge can also be incinerated in appropriate devices jointly with good results. (Waid-Texas)

REUSE OF INDUSTRIAL COOLING WATER,
Water Service Labs., Inc., New York.
Sidney Sussman.
Water and Wastes Engineering, Vol 6, No 1, Jan 1969. p A6-A10, 2 fig, 2 tab, 5 ref.

Descriptors: *Cooling water, *Water reuse, *Cooling towers, Cooling, Water conservation, Corrosion control, Alkalinity, Evaporation.
Identifiers: Blowdown.

Industrial cooling is both one of the largest uses of water and one of the largest examples of water reuse. In 1964, water withdrawal for industrial cooling in the U.S. was estimated at 44.7 trillion gallons. Of this amount, 99% was used in once through cooling, and only 500 billion gallons was used as makeup for recirculating cooling systems in which the water was reused repeatedly. Due to the tremendous volume of water used, only the most essential, very minimum, and least expensive treatment is given the water. This may include straining, sedimentation, chlorination, and corrosion control. In water short areas, secondary effluent from municipal waste water treatment plants can be effectively used for makeup water source. Both closed and open cooling systems are employed. Open systems include cooling towers, evaporative condensers, and evaporative coolers. Evaporative coolers work on the principle of removal of heat as latent heat of evaporation. Use of evaporative coolers can reduce water intake as much as 98% over once thru cooling systems. Problems occur due to chemical composition changes in cooling water from evaporation and exposure to air. Evaporation of water results in an increase in dissolved solids concentration which results in scale formation. Exposure to air results in an equilibrium between gases in the air and the water. BIODEGRADATION OF SURFACTANT BENZENE RINGS IN SHAKE CULTURES,
Monsanto Co., St. Louis, Mo. Inorganic Chemicals Div.
R. D. Swisher.
Developments in Industrial Microbiology, Vol 9, 1968. 270-279 p, 5 fig, 1 tab, 11 ref.

Descriptors: *Biodegradation, *Surfactant, *Microorganisms, Degradation (Decomposition).
Identifiers: *Benzene ring, *Shake-culture, *Ultraviolet analysis, *Acclimation, Biodegradation, Pathways, Interference, Deacclimation, Cross acclimation.

The work is undertaken to determine whether ring degradation could be achieved under milder conditions characteristics of the shake culture biodegradation test methods. Two pure isomers representative of the components of linear alkylbenzene sulfonate (LAS) were studied, the 3-phenyl and 6 phenyldodecane sulfonates conditions of the standard shake culture biodegradation test method using a culture already acclimated to mixed LAS, were modified to permit (a) use of the characteristic 193 and 223 mu ultraviolet absorption bands for detection of the benzene rings (b) acclimation of the cultures to accomplish ring degradation. After full acclimation the extent of ring degradation of both isomers was at least 80% and may have been 100%; spectroscopic interferences preclude calculation of the exact value. Acclimation to 6 phenyl ring degradation includes acclimation to the 3-phenyl isomer also, but not vice versa. This suggests that the biodegradation pathways may be significantly different for the two isomers. Interference by nitrate in biodegradation of benzene, toulene, etc. characterized by development of strong absorption below about 240 mu in the control culture is also noted. Acclimation rates, ring degradation rates, cross acclimation effects were analyzed. (Shankar-Texas)

PRETREATMENT OF SEWAGE SLUDGE,
Technische Hochschule, Aachen (West Germany). Institut fuer Siedlungswasserwirtshaft.
B. Boehnke.
Fourth International Congress of the International Research Group on Refuse Disposal, Proceedings, Bosel, June 2-5, 1969. N.P., N.D., p 615 - 631.

Descriptors: *Sludge, *Stabilization, *Operations, *Sewage sludge, *Pretreatment, *Cost, Vacuum drying, Filtration, Lagoons, Drying, Dewatering.
Identifiers: *Sludge thickening, Drying beds, Vacuum-filtration, Pressure filtration, Conveyor screen press.

A summary of the meetings and discussions of the working group 5 of the 4th International Congress of the IRGR is presented. The theme is discussed under eight sections, namely: (1) criteria for the degree of aerobic and anaerobic sludge stabilization. (2) Operational experience and cost of the following: (a) aerobic and anaerobic sludge stabilization, (b) sludge thickening, (c) centrifugation while considering pre-conditioning, (d) sludge processing in drying beds and sludge lagoons, (e) vacuum filtration while considering pre-conditioning, (f) pressure filtration while considering preconditioning, and (g) sludge dewatering through conveyor screen presser. Based on the above studies is concluded that there is no ideal process for sludge treatment but an adequate solution can be found for every particular case. The choice of treatment depends on the sewage plant and partly on the possibilities available for final sludge disposal. The choice of the process depends also on the objective assigned to the particular treatment stage. Cost figures are given for some of the processes. Since it is difficult to say with certainty the most economical combination of two or more processes, it is advisable to make tests. Much progress has been made in the different processes mainly due to high molecular weight flocculants. (Shankar-Texas)
W70-09811

PERFORMANCE OF (ACTIVATED SLUDGE) SECONDARY SEDIMENTATION BASINS,
Peter Pflanz.
Fourth International Conference on Water Pollution Research, Prague, September 2-6, 1968. Preprint, 15 p, 7 fig, 2 tab, 10 ref.

Descriptors: *Settling basin, *Activated sludge, *Effluent, Biochemical oxygen demand, Aeration, Efficiencies.
Identifiers: *Aeration tank, Detention time, Solids concentration, Sludge volume index, Suspended solids.

Tests conducted at Hannover in various activated sludge plants are discussed with a view to determining the relationship between solids concentration of activated sludge, detention time and suspended solids in the effluent from secondary sedimentation. A description of the plants studied is presented. The sedimentation rate of the activated sludge is dependent upon a series of factors, the most important being the dry solids matter content of the sludge. The sedimentation process in the secondary basin is demonstrated with solids profiles. Tests showed that an increase in the solids content in the effluent is followed by an increase in the BOD. The relationship between BOD and suspended solids in the effluent varies for different plants. A useful criterion for dimensioning secondary settling basins is the product of the overflow rate and the suspended solids content of the mixed liquor. With readily setteable sludges (SVI=100 ml/g) the maximum solids feed can be as high as 3.5 kg SS/m sq hr. At a SVI of 200 ml/g the maximum solids feed decreases to approximately 1.1-1.3 kg SS/m sq hr. When the sludge volume index is increased to 300 ml/g a maximum solids feed of 0.8-1.1 kg SS/m sq hr must be considered in a secondary basin, if the solids content in the effluent is not to exceed 30 mg/l. (Shankar-Texas)

DISPOSAL OF INDUSTRIAL SLUDGES,
Institut fuer Wasserwirtschaft, Berlin (East Germany).
W. Niemitz.
Fourth International Congress of the International Research Group on Refuse Disposal, Basel, June 2-5, 1969, N.P., N.D., p 425-435.

Descriptors: *Sludge, *Sludge disposal, Industrial waste, Aerobic treatment, Anaerobic treatment, Digestion, Dewatering, Neutralization, Pre-treatment (Water), Sedimentation.
Identifiers: *Industrial sludge, Petrification, Polyelectrolytes, Composting.

A definition of 'industrial sludge' was presented through its characteristics which are generally: (1) a tremendous variability as to types of sludges produced in the various industries and, (2) the composition of a specific sludge is usually more homogeneous than in domestic sludge. In order to further define 'industrial sludge' a summary of essential specific and general facts and findings already fully acknowledged were listed and include: (1) processing and disposal methods should be as flexible as possible and include efforts to re-use waste materials, (2) possibilities of joint processing and disposal of industrial and municipal refuse should be studied, (3) sludge should not only be dewatered as far as possible but also be stabalized biologically, before any disposal. (Waid-Texas)

DISPOSAL OF INDUSTRIAL SLUDGES,
Institut fuer Wasserwirtschaft, Berlin (East Germany).
W. Niemitz.
Fourth International Congress of the International Research Group on Refuse Disposal, Basel, June 2-5, 1969. N.P., N.D., p 436-443.

Descriptors: *Lagoons, *Sludge disposal, Groundwater, Incineration, Industrial waste, Standards, Sewage, Sludge, Dewatering.
Identifiers: *Standardization, *Pre-treatment, *Compost, *Wet-air oxidation, Refuse disposal, Model sludges.

The conclusions of the lectures and discussions of working group two of the fourth Congress of the IRGR are presented. A complex account of the variety of possibilities to characterize industrial sludges were given with respect to pre-treatment and disposal. It was concluded that standardization was necessary to calibrate research methods and give comparable data. This idea was supplimented by a presentation on the usefulness of calibration sludges or model sludges in paper production. The suitability of lagoons for the treatment of sludges was surveyed and the need to take into account the different functions possible for successful operations was emphasized. The immediate spreading of sludges over suitable areas after insuring no soil damage or groundwater pollution was discussed. The working group also discussed several methods of sludge disposal and in general concluded that research should be intensified and that considerable improvement be made in the exchange of information of the research groups concerned. FLUIDIZATION OF FLOCS PRODUCED IN CHEMICAL OR BIOLOGICAL TREATMENT PLANTS,
Centre Belge d'Etude et de Documentation des Eaux, Liege; Technical Coll. of Transport Engineering, Zillina (Czechoslovakia); and Hydraulic Research Inst., Brno (Czechoslovakia).
F. Edeline, I. Tesarik, and J. Vostrcil.
Fourth International Conference on Water Pollution Research, Prague, September 2-6, 1968. Preprint, 9 p, 7 fig, 1 tab, 2 ref.

Descriptors: *Activated sludge, *Sedimentation, *Biological treatment, Settling velocity, Waste water treatment, Reynolds number.

dentifiers: *Fluidization, *Clarification, *Flocs, uspension density.

t is claimed that upflow clarification results in igher efficiencies for the same clarification surace when compared with conventional sedimentaion. The advantages may be a better removal of uspended matter, or a higher permissible flow per nit area or both. Theoretical relationships pertaing to this phenomenon for flocculated matter and or living flocs from activated sludge are eveloped. General theory relative to fluidization f particles is discussed. Classical formula for uidization of particles is assumed to be valid for ocs in the region of Reynold's numbers between -30. Experiments with the fluidization of a layer of ocs produced by chemical treatment were perormed in a cylindrical transparent model epresenting the clarifier produced by the ralovopolska factory in Brno, Czechoslovakia. rom the results, the relation between volume conentration and suspension densities are established. omparison between fluidization and sedimentaon velocities for the same suspension show that ie agreement is fair, with settling velocity slightly wer than fluidization velocity. The same is true or biological flocs in activated sludge. The descripon of physical properties of the fluidization rocess by these formulae yields coefficients which ay be helpful in appreciating qualities of the flocs rmed either chemically or biologically. IODIFIED FILTER MEDIA FOR REMOVAL F WATER POLLUTANTS,
idian Inst. of Tech., Kanpur. Dept. of Civil Enneering.
. D. Agrawal, and A. V. S. Prabhakara Rao.
ourth International Conference on Water Polluon Research, Prague, September 2-6, 1968. reprint, 9 p, 5 fig, 10 ref.

escriptors: *Filter, *Filtration, Coagulation, Effiency, Head loss, Turbidity, Waste water treatent.
lentifiers: *Electro-Kinetic force, Surface Potenal, Filter media, Bauxite media.

he development of a simple filter with modified edia for efficient removals of micro sized parties is discussed. The efficiencies of filtration can significantly improved by suitably altering the rface properties of media with more desirable rface potentials. Higher filtration efficiencies ere obtained when filter media were coated with tionic polyelectrolytes to give a positively anged media, to effectively remove and retain e negatively charged particles. With such filters lvance coagulation with alum or ferric chloride n be obviated and the process thus simplified. rther the head loss build up on such a filter is uch slower and the removals are more uniformly stributed through the bed. The results of instigation of alternative filter media and coatings form a positively charged layer on sand to give ficient filtration of natural waters without any etreatment are discussed. Less than 10 mg/l. turdity could be produced by filtration of raw stream ater or pond water, through crushed bauxite or nd coated with Al2SO3 or Fe2O3. (Shankar-Tex-)

REATMENT OF WASTE WATERS FROM RAFT-CELLULOSE FACTORIES,
stitute of Hydrotechnical Research, Bucharest tumania).
Munteanu, E. Cute, and C. Negulescu.
ourth International Conference on Water Pollun Research, Prague, September 2-6, 1968. eprint, 10 p, 10 fig, 12 ref.

escriptors: *Waste water treatment, *Biological eatment, *Sludge treatment, Organic loading, Efiency, Foaming, Biochemical oxygen demand, enol, Aeration.

Identifiers: *Pilot plant, *Mechanical treatment, Settling tanks, Hydraulic loading, Aeration channels, Drying beds.

A semi industrial pilot plant was built to test the treatment of waste waters from kraft-cellulose factories and to determine the parameters useful for plant design. Investigations were carried out over a period of 250 days using mechanical treatment, biological treatment and sludge treatment. Two types of settling tanks were used in the investigation using mechanical treatment. It was concluded that upward flow settling tanks allow hydraulic loadings twice as great as those in radial flow tanks with the same treatment efficiency. However, the use of upward flow settling tanks is not recommended due to a strong foaming tendency. The sludge from mechanical treatment does not readily undergo bacterial decomposition. The biological treatment of the waste water was tested using small scale aeration tank with air injected at reduced pressure. The waste water after settlement easily responded to biological treatment provided it was furnished with mineral requirements for bacterial growth. The treatment by activated sludge gives satisfactory results at short aeration periods when partial treatment of the wastes is required and it was found that phenol in the waste water could be removed completely by this method. (Shankar-Texas)

ACTIVATED SLUDGE PROCESS MODIFICATION FOR NITROGEN-DEFICIENT WASTES,
Oklahoma State Univ., Stillwater, and Nalco Chemical Co., Chicago, Ill.
A. F. Gaudy, Jr., K. C. Goel, and A. J. Freedman.
Fourth International Conference on Water Pollution Research, Prague, September 2-6, 1968. Preprint, 11 p, 8 fig, 1 tab, 4 ref.

Descriptors: *Activated sludge, *Chemical oxygen demand, *Biochemical oxygen demand, *Nitrogen aeration, Operations, Waste water treatment.
Identifiers: *Nitrogen-deficient wastes, *Operational feasibility, *Sugar refinery, Mechanical feasibility, Detention time, Endogenous-aerator, Plug flow.

The mechanistic feasibility of activated sludge process using whole waste and the operational feasibility of the process under conditions of continuous waste flow is investigated. A nitrogen deficient industrial waste was selected for use in this research and it consisted of sugar refinery effluent. a large fraction of soluble organic matter in the sugar refinery waste was assimilated by the sludge in the absence of an exongenous nitrogen source. The sludge thus synthesized readily settled under quiescent conditions and the supernanant contained relatively small amounts of organic matter A significant portion of the cell constituents of the settled sludge, (converted to protein in the endogenous aeration phase in the presence of extracellular nitrogen) regenerated the COD removal efficiency of the sludge. This was exhibited by its nitrogen retention ability upon recycling to the feeding aerator. The process was operated successfully at a detention time of 5 hours, a COD: N ratio of 60:1 and COD: P ratio of 140:1. COD of the sugar refinery waste varied widely during the study. It was felt that aeration solids levels employed in these studies could be treated successfully with pH adjustments or control. It appears that the process will give good results on wastes which are not purely carbohydrate in nature, and may thus find wide applicability for nitrogen deficient industrial wastes. (Shankar-Texas)

INVESTIGATION OF THE USE OF HIGH PURITY OXYGEN AERATION IN THE CONVENTIONAL ACTIVATED SLUDGE PROCESS,
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
J. G. Albertsson, J. R. McWhirter, E. K. Robinson, and N. P. Vahldieck.

Available from the NTIS as PB-194 241, $3.00 in paper copy, $0.65 in microfiche. Federal Water Quality Administration Water Pollution Control Research Series, May 1970. 186 p, 29 fig, 62 tab, append. FWQA Project 17050DNW--5/70.

Descriptors: *Sewage treatment, *Activated sludge, *Oxygenation, Aerobic treatment, Sludge digestion, Sludge treatment, Oxidation.
Identifiers: Sludge oxygenation.

A full scale system designed to demonstrate the practical and economical use of high purity oxygen gas in aeration of the conventional activated sludge waste treatment process was tested under a variety of operating conditions in a direct performance comparison with a parallel air aerated system. A sparged-turbine, gas-liquid contacting unit was employed in covered tanks of conventional design with liquid and gas staging for cocurrent flow of each phase. This oxygenation system required very low power input for oxygen transfer and liquid mixing. The oxygenation system could operate with MLVSS concentrations of as high as 4500 mg/liter achieving about 90% BOD removals at aeration detention times as low as 1.2 hours (raw flow + recycle flow) treating domestic waste of 220 mg/liter BOD. Biomass from the oxygenation system is highly flocculent and readily settleable with desirable handling characteristics. Recycle and waste activated sludge suspended solids concentrations of about 3% were achieved. Process advantages recognized with the oxygenation system indicate significant reductions in secondary waste treatment costs in comparison to conventional diffused air aerated systems. (Knapp-USGS)

THE FATE OF NITROGENOUS COMPOUNDS THROUGH SEWAGE TREATMENT PLANTS,
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
Nava Narkis.
Washington Univ, St Louis, Missouri, Center for the Biology of Natural Systems, Environmental Field Program, February 1970. 52 p, 1 fig, 18 tab.

Descriptors: *Nitrogen compounds, *Sewage treatment, *Domestic wastes, Chemical analysis, Effluents, Trickling filters, Hydrolysis, Biological treatment, Activated sludge, Tertiary treatment, Ion exchange, Electrochemistry, Reverse osmosis, Electrodialysis, Distillation, Nitrification, Denitrification, Septic tanks, Oxidation lagoons, Land application, Bacteria, Algae, Symbiosis, Public health, Chlorine, Corrosion.
Identifiers: *Literature survey, Primary sewage treatment, Secondary sewage treatment, Physicochemical methods, Ammonia stripping, Guggenheim process.

Literature concerning nitrogenous compounds in sewage treatment plants is reviewed, especially emphasizing the modification or replacement of classical treatment operations to remove dissolved inorganic materials more efficiently. In primary treatment, nitrogen removal is low and sedimentation of suspended solids is the only physical process contributing to its total reduction. Returning supernatant liquor from sludge digesters to primary clarifier decreases nitrogen removal efficiencies. Clarified waste water from primary treatment may receive secondary treatment, normally a biological process, designed principally to reduce amount of suspended solids, oxygen demanding material and bacteria. Activated sludge and trickling filters remove 20% to 50% of the incoming nitrogen. Effluents from trickling filters contain high organic and ammonia nitrogen as well as nitrates and nitrites. It is possible to operate activated sludge processes to effect high nitrate concentrations, while ammonia nitrite and organic nitrogen concentrations are minimal. In the tertiary treatment, among the physicochemical methods for removing nitrogenous compounds from effluents, ion exchange and ammonia stripping are the only suitable methods presently efficient. Nitrogen removal by microbial denitrification seems economically

feasible. Septic tank effluents are analyzed. Stabilization ponds do not remove nitrogen compounds adequately. (Jones-Wisconsin)

HYDROLYSIS OF ACTIVATED SLUDGE,
Snell (Foster D.), Inc., Florham Park, N.J.
R. J. Bouthilet, and R. B. Dean.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 13 p, 15 fig, 9 ref.

Descriptors: *Activated sludge, *Sewage treatment, *Hydrolysis, Waste water treatment, Fertilizers, Filtration, Nutrients, Waste disposal, Biological treatment, Sludge.
Identifiers: *Refractory organics, *Biological solids.

Of concern in sewage disposal plants is the disposal of the solids which accumulate as a result of various separation procedures. Of particular concern is the disposal of activated sludge which is the solids residue resulting from aerobic digestion of soluble or non settleable solids in sewage. Various processes have been suggested to aid the thickening and clarification of these aerobic residues. These include addition of chemical coagulants and precipitants such as ferric chloride, polyelectrolytes, lime, alum, and others. Other treatments have evolved which involved conditioning the settled sludge before filtration. An improved process for the treatment of activated sludge has been developed. The process consists of heating of activated organic sludge in the presence of water and small amounts of sulphur dioxide. This treatment increases soluable solids, improves filtration efficiency by a factor of 100 and reduces the moisture conttne of the resultant filter cake. Concentration of the filtrate produced a molasses type syrup which from amino acid analysis and rat feeding studies could be of value as an animal feed. The cost of digesting 25,000 pounds of solids yielding a syrup containing 20% solids will be $160.69. Evaporation to molasses will cost $244. (Hancuff-Texas)

SLUDGE TREATMENT DISPOSAL AND UTILIZATION (Literature Review),
R. I. Dick.
Journal Water Pollution Control Federation, Vol 42, No 6, p 934-949, June 1970. 119 ref.

Descriptors: *Sludge, *Sludge treatment, *Sludge disposal, Sludge digestion, Dewatering, Incineration, Ultimate disposal, Fertilizer, Sewage treatment, Waste water treatment.
Identifiers: Characterization, Conditioning, Thickening.

Studies have been made to determine the optimum solution of the total waste treatment problem which includes socioeconomic evaluation and technical feasibilities. The treatability of sludges produced from advanced waste treatment largely have been ignored, and the sludges produced by the removal of phosphates through the precipitation with lime have created some difficult problems. The results of many investigators' studies on conditioning of sludge prior to dewatering is outlined. The use of polyelectrolytes quar gum, alum, flyash, lime and a variety of other sludge conditioners are discussed. Prethickening, freezing and thawing, and paramagnetic separation are a few newly proposed sludge conditoning processes. Gravity and flotation thickening are discussed in some detail and several pilot plant and full-scale process results are presented. In the discussion of sludge dewatering, several processes are evaluated: sand drying beds, vacuum filtration, centrifugation and mechanical gravity dewatering units. The calorific value of sludges is discussed in regard to sludge incineration and the recalcination processes for lime recovery evaluated. Many suggestions are presented for the ultimate disposal of sludge, including because of its commercial fertilizer value irrigation (Hancuff-Texas)

IMPLICATIONS OF MICROBIAL POLYMER SYNTHESIS IN WASTE TREATMENT AND LAKE EUTROPHICATION,
Ohio State Univ., Columbus.
P. R. Dugan, R. M. Pfister, and J. I. Frea.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint, 10 p, 9 fig, 13 ref.

Descriptors: *Nitrification, *Microbiology, *Waste water treatment, Sewage treatment, Synthesis, Aerobic, Treatment, Biological treatment, Metabolism, Adsorption, Flocculation, Natural streams, Lakes.
Identifiers: *Polymers, Cells, Natural waters.

The aggregation or flocculation of the biomass formed by microbial metabolic reactions results in settling and thereby provides a means for mechanically separating cells from supernatant. These processes are complicated by adsorption on suspended particles of inorganics as well as organics that are not readily oxidized. Adsorption is a physical-chemical phenomenon but the biological formation of adsorption sites on sludge floc also relegates this to a consideration which overlaps biology. The group of bacteria historically recognized as primary contributors to aerobic waste treatment were studied. All the floc forming bacteria have been observed to produce extra cellular polymer fibrils. The physical and chemical properties of these fibrils around different species of bacteria will determine the extent to which water is bound to the polymer and also determine solubility properties of the polymer and affinity for adsorption of dissolved chemicals. A discussion is presented on the relationship of ion adsorption to polymers and its relationship to waste treatment nitrification. The interactions among floc forming microorganisms found in natural waters, suspended solids, dissolved chemical and other particulates are similar to those observed in waste treatment systems. (Hancuff-Texas)

ENVIRONMENTAL SIMULATION AS A TOOL IN A MARINE WASTE DISPOSAL STUDY OF JAMICA BAY,
Rand Corp.
J. J. Leendertse.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 7 p, 2 fig, 4 ref.

Descriptors: *Computers, *Programme, *Simulation analysis, Ecology, Environment, Mass transfer, Mathematical model, Flows, Water pollution, New York.
Identifiers: *Marine disposal, *Jamica Bay (New York), Grids.

The study of technical solutions to the problem of managing fluid waste discharges in an estuary involves complicated relationships, such as those between waste load, location of discharges, degree of treatment, geometry of the estuary, flow in the estuary, and temperature. Models can be built to predict the probable consequences of each of the alternative solutions chosen. Such a model is being used and evaluated in a study of the extent and control of pollution in Jamica Bay, New York. A model of the fluid waste discharge establishes the relationship between the transport of pollution and the transporting medium. A reaction model is designed to describe the chemical and biochemical transformations. In the flow model velocities of the water in the region are computed together with the water levels. Because the tide state influences the location of the waters edge on the tidal flats, which effects surface area and cross sections to a considerable extent, such functional relationships are included in the model. The flow in the estuary is governed by the shape of the estuary and its boundaries at the sea and inland ends as well as by the tides and river discharges. The fluid waste loads in the system influence the pollution constituent transport while air temperatures, solar radiatio and exchange of gases at the water surface i fluence the reactions. TREATMENT-COST RELATIONSHIPS FO ORGANIC INDUSTRIAL WASTES,
National Inst. for Water Research, Pretoria (Sou Africa); and Texas Univ., Austin.
J. L. Barnard, and W. W. Eckenfelder, Jr.
Fifth International Water Pollution Research Co ference, San Francisco, July 26-August 1, 197 Preprint, 19 p, 5 fig, 7 tab, 7 ref.

Descriptors: *Industrial wastes, *Waste wat treatment, *Costs, *Mathematical model, Waste Water quality, Biological treatment, Organic loa ing.
Identifiers: Parameters, Characteristics.

The coming decade will see a large number plants constructed for the treatment of organ waste waters. These plants may treat industri wastes alone or industrial wastes in combinatic with domestic sewage. Various process combin tions can be employed to yield specific efflue qualities. Depending on the desired effluent quali and the characteristics of the waste water o process combination will prove the most econom cal. A treatment process sequence was selected f waste waters from the organic chemical indust and for various combinations of domestic and i dustrial waste water. Each treatment sequence w designed for a range of waste characteristics ar treatment parameters and the total plant cost w developed. Cost models were then generated whic described the influence of the various paramete on the total cost. This serves to illustrate the econ my of scale and the significance of the vario parameters on cost. The sensitivity of the capit cost to change in the waste parameters is shown. the development of the cost models wide variatio of design parameters were incorporated. For the i dustrial model BOD was varied from 200 to 3,0 mg/l, suspended solids from 0 to 500 mg/l and from 0.0001 to 0.0007 l/mg per hour. For the con bined treatment model BOD and suspended solic varied from 200 to 800 mg/l and K from 0.0001 0.00013 l/mg per hour. (Hancuff-Texas)

MARINE WASTE DISPOSAL IN GHAN WATER QUALITY EVALUATION,
University of Science and Technology, Kuma (Ghana).
C. K. Annan, and A. M. Wright.
Fifth International Water Pollution Research Co ference, San Francisco, July 26-August 1, 197 Preprint. 7 p, 2 fig, 2 tab, 9 ref.

Descriptors: *Sewage, *Monitering, *Water qual ty, *Evaluation, Chemical properties, Biologic properties, Physical properties, Bacteria, Sewag treatment, Analysis.
Identifiers: *Marine disposal, Ghana.

Special studies on the aspects of water quality wer made to plan the most appropriate marine was disposal system which would provide adequate pr tection for the beneficial uses of the coastal wate The significant findings of this study were as fo lows: (1) the strength of the sewage from th Accra-Tema Metropolitan Area is expected to b medium strength, that is, a BOD of 280 mg/l an total suspended solids of 219 mg/l. (2) The greas content of the sewage is expected to be relativel high in comparison with urban wastes of the Unite States, i.e. 110 mg/l. (3) the bacterial dieaway rat in the receiving waters is high (T sub 90 of 8 minutes). (4) strong Guinea currents exist on th coast. These currents are predominately parallel t the shore line, (5) except in areas of direct pollu tion the beach waters in the study area were foun to be relatively free of coliform organisms. It is ar ticipated that the strong Guinea currents woul transport the wastes away from the discharge loca tions generally parallel to the shore line. This facto

coupled with the high coliform bacteria die-off rate implied that appropriately treated sewage could be discharged safely through a well designed marine outfall system. (Hancuff-Texas)

PROPOSED PLANS FOR SEWAGE DISCHARGE FROM THE GOTHENBERG REGION, SWEDEN,
Goteborg Water and Sewage Authority (Sweden).
E. Rindergard, and S. Hallquist.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 8 p, 3 fig, 2 tab.

Descriptors: *Sewage disposal, *Sewage treatment, *Planning, Waste water treatment, Alternative costs, Water pollution, Costs.
Identifiers: *Gothenburg (Sweden), Outfall, Study.

Gothenburg is the second city of Sweden and is situated on its western coast. Its population is now about 450,000, and it is estimated the total population will be 750,000 in the year 2000. The river Gota Alv flows through Gothenburg. The main pollutant in the river are (1) suspended solids, 50,000 tons/yr inorganic (clay) and 20,000 tons/yr organic matter (2) industrial waste mainly from paper mills but also from metal and chemical factories, and (3) bacteria. There are no problems affecting the dissolved oxygen and BOD of the river water. The amount of suspended solids in the sewage from the city is equivilant to roughly 10,000 tons/yr. The equivilant of about 400 tons/yr of P enters the river with the sewage and increases the P content to approximately 0.06 ppm. The proposed sewerage system consists of construction of intercepting pipelines and rock tunnels by which all sewage from the city can be conveyed to a site where a treatment plant is to be built. After treatment the sewage could be discharged either into the mouth of the river or into the sea beyond an archipelago which lies just off of the coast. In order to compare conditions at alternative points an extensive investigation has been undertaken. Discharges of the sewage into the sea outside the archipelago, whether after primary treatment alone or with high rate biological treatment, seems to offer an acceptable solution. (Hancuff-Texas)

REMOVAL OF FLUORINE AND ARSENIC FROM THE WASTE WATER OF THE RARE-EARTH INDUSTRY,
State Research Inst. for Rare Metals, Moscow (USSR).
T. Skripach, V. Kagan, M. Romanov, L. Kamen, and A. Semina.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 7 p, 12 fig, 1 tab.

Descriptors: *Fluoride, *Arsenic compound, *Waste water treatment, *Industrial wastes, Iron, Chemical precipitation, Efficiency, Mixing, Flocculation, Sedimentation, Oxidation.
Identifiers: *Rare-Earth metals, Agitation.

The removal of fluorine from industrial waste waters is accomplished through the use of calcium oxide. The reagent consumption was 200% of the amount required stoichiometrically. The agitation time required without heating is 45 minutes. Results show the fluorine content of the purified water is from 15 to 20 mg/l. Final polishing for the removal of small amounts of fluorine should be made with super phosphate and calcium oxide, or aluminum sulfide. The feasibility of using ion exchange resins and membranes for the removal of fluorine has been shown. The removal of arsenic from industrial waste waters can also be effected with calcium oxide. Iron must be present in an amount which assures total removal of arsenic compounds. If iron salts are not present a special treatment process is required and the description of the treatment is presented. (Hancuff-Texas)
W70-09943

POLYMER PARTICLE REMOVAL FROM LIQUID EFFLUENTS,
V. A. Prokhorova.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 7 p, 2 fig, 5 tab, 12 ref.

Descriptors: *Effluents, *Coagulation, Chemical precipitation, Colloids, Stabilization, Waste water treatment, Biological treatment.
Identifiers: *Polymers, *Particles, *Removals, Chemical composition.

Suspension, polymerization and copolymerization of styrene using a stabilizer, a suspension of polyvinyl alcohol containing 10 to 21% acetate groups, yields liquid effluents which are stable colloidal systems from the point of view of sedimentation and aggregation and which cannot be treated biologically without pre-treatment. The precipitation and coagulation treatment for the removal of polyvinyl alcohol was studied using alum and magnesium chloride. The results show that magnesium chloride coagulation was much more advantangeous. The following would be essential advantages over the commonly used alum: (1) coagulant consumption is reduced 6 to 7 times, (2) caustic soda consumptions is reduced 2 to 3 times, (3) volume precipated is reduced 5 to 7 times, and (4) the rate of precitation of suspended matter is increased 22 times. The experiments also showed that the pretreated effluents can be treated biologically without dilution. Chemical oxygen demand after chemical treatment ranged from 470 to 2,200 mg/l. Biological oxygen demand after biological treatment was 14 mg/l. As a result of biological treatment the effluents lost their specific sharp odor. (Hancuff-Texas)

BIOLOGICAL FILTERS, (LITERATURE REVIEW),
R. L. Bunch.
Journal Water Pollution Control Federation, Vol 42, No 6, p 895-897, June 1970, 24 ref.

Descriptors: *Trickling filter, *Biological treatment, *Waste water treatment, Filters, Filtration, Costs, Operations, Design, Sewage treatment, Mathematical model, Nutrients.
Identifiers: Variables.

A review of the 1969 literature on biological treatment through the use of trickling filters is presented. A variety of studies have been made on the design, mathematical modeling, industrial applications, and dynamic optimization of these filters. Several studies were performed on evaluating media and the effect of recirculation on efficiency. A large number of cost analyses were made; one summarizes the findings from 1500 waste water treatment plants. Two studies relating to nutrient removal were reported. Because the rotating biological discs method of treating wastes is related to trickling filters it was included in this topic. The variables investigated were hydraulic loading, organic loading, disc speed rotation and dissolved oxygen content of the mixed liquor. (Hancuff-Texas)

OXIDATION OF AQUEOUS SULFIDE BY O2: I. GENERAL CHARACTERISTICS AND CATALYTIC INFLUENCES,
Harvard Univ., Cambridge, Mass.
K. Y. Chen, and J. C. Morris.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 17 p, 12 fig, 1 tab, 15 ref.

Descriptors: *Oxidation, *Sulfides, *Oxygen, *Catalysts, Alkaline waters, Test procedures, Hydrogen, Ion concentration, Kinetics.
Identifiers: Stoichiometry, Experiments.

This survey of kinetic patterns and external influences in the oxidation of aqueous sulfide by oxygen has served primarily to show the extreme complexity of the oxidation and the numerous types of outside factors that can speed up or retard the rate. The variation of the initial rate of reaction with respect to sulfide were conducted varying the sulfide concentration and the oxygen concentration. The influences of pH on the reaction rate are also discussed. No definitive or even tentative mechanism can be proposed on the basis of the current results but the data do provide a basis for the kind of detailed experimentation needed to develop a reasonable mechanism. That the reaction as a chain has been shown rather definitely. The problem now is to find the chain carriers and the pathway of their reactions. From a practical point of view the general data indicate that in some circumstances sulfide and oxygen may coexist in aqueous solution for quite long periods of time. On the other hand the effects of metal ions in various types of organic compounds indicate that it will be difficult or impossible to predict a lifetime of sulfide in any given natural water even in the absence of biological effects. The catalytic effects of metal ions may however provide a means for speeding up the oxidation circumstances where it is desirable. (Hancuff-Texas)

VOLATILIZATION AND NITRIFICATION OF NITROGEN FROM URINE UNDER SIMULATED CATTLE FEED LOT CONDITIONS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
B. A. Stewart.
Environmental Science and Technology, Vol 5, No 7, p 579-582, July 1970. 1 fig, 7 tab, 7 ref.

Descriptors: *Nitrification, *Cattle, *Soils, Ammonia, Nitrogen Moisture content, Depth, Chemical oxygen demand, Farm wastes, Urine.
Identifiers: *Feed lots.

Virtually all the recent growth in cattle feeding has been in feeding units of 10,000 head or more in which cattle are confined in pens allowing 6 to 20 sq meters per animal. Animal wastes resulting from these large feeding operations cause concern in many areas. Disposal of the accumulation of solids wastes is difficult and in some cases run-off from these lots has caused pollution of streams and lakes. Feeding operations can cause high nitrogen concentrations in the underground water supply. There are large differences in the amount of nitrate found under feed lots: some contain large amounts, other nearly nitrate free, both at shallow and deep depth. The objectives were to simulate some feed lot conditions and study the nitrification and volatilization weights of nitrogen added as cattle urine to soil in an attempt to determine some of the factors governing nitrate accumulation under feed lots. Urine accounts for about half of the nitrogen excreted by cattle. When urine was added every two days to an initial wet soil at a rate of 5 ml per 21 cm sq, less than 25% of the nitrogen was lost as ammonia and about 65% converted to nitrate. When urine was added every 4 days to initially dry soil, essentially all the water evaporated between the urine additions, and 90% of the nitrogen was lost as ammonia. These findings suggest that the stocking rate and other management factors should be considered in pollution of the unit. (Hancuff-Texas)

COMPUTER DESIGN OF CMAS SYSTEMS,
Kansas Univ., Lawrence.
Daniel W. Smith.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 96, No SA4, p 977-990, August 1970. 7 fig, 4 tab, 11 ref.

Descriptors: *Computers, *Computer programs, *Activated sludge, *Mathematical model, Waste water treatment, Sewage treatment, Design, Mixing, Cost, Optimization.
Identifiers: *Complete mixing conditions, Suspended solids, CMAS.

The complete mixing activated sludge (CMAS) model combined with cost information to allow selection of the most economical unit based on construction cost and operating conditions is developed into a computer designed program. The procedure followed is first to select a sludge age and aeration tank size and then solve the complete mixing activated sludge equations for each set of input data. The aeration tank size and sludge age values are incremented the desired number of times and amount with the calculations repeated each time. The cost of the secondary system is determined once for each aeration tank size and stored by the computer. The average unit BOD5 removal cost and average unit suspended solids removal cost are determined for each tank size. At each sludge age the aeration tank with the lowest unit BOD5 removal cost meeting the operational limits is selected. The processor time required for the actual execution of the program is 0.504 minutes based on a run using 15 sets of data 10 tank sizes, and 10 sludge age values. The cost of computer and related systems time and for the printing of the output is approximately $2.65. (Hancuff-Texas)
W70-10024

ANAEROBIC PROCESSES (LITERATURE REVIEW),
S. Ghosh, and F. G. Pohland.
Journal Water Pollution Control Federation, Vol 42, No 6, p 920, 934, June 1970. 99 ref.

Descriptors: *Anaerobic digestion, *Sludge treatment, *Digestion, Waste water treatment, Sewage treatment, Microbiology, Kinetics, Control, Organic loading, Efficiencies, Performance.
Identifiers: Applications.

A review of the 1969 literature on anaerobic processes is presented. Microbiology of anaerobic digestion is characterized by several authors in terms of the predominant species. A wide variety of substrates, intermediate products and end products are presented for the digestion process. There is an increased interest by researchers in developing rock filled upflow-type anaerobic filters. The loadings, efficiencies, and design parameters of this type filter are enumerated. Use of anaerobic denitrification is evaluated by several authors. The feasibility of treating dilute wastes under anaerobic conditions was investigated and a great deal of data is presented on loadings, efficiencies, sludge concentration, temperature influences and gas production. The advantages of multi stage anaerobic processes are elaborated. The effects of various parameters such as temperature, pH, electrode potential, and loading were reported. Many studies were made on the kinetics of digestion attempts were made at developing inhibition functions which reflected the growth limiting characteristics. Several methods were suggested for digester control, the oxidation reduction potential in combination with the pH being the most intensely discussed. Some applications of digestion were the digestion of carbohydrates, spent sulfide liquor, cane sugar, factory waste water, molasses decomposition distillary waste water and waste water from glycerol production. (Hancuff-Texas)

MIXED LIQUOR SOLIDS SEPARATION BY FLOTATION,
Federal Water Quality Administration, Washington, D.C.
Michael C. Mulbarger, and Donald D. Huffman.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 96, No SA 4, p 861-870, August 1970. 5 fig, 3 tab, 9 ref.

Descriptors: *Activated sludge, *Aeration, Waste water treatment, Performance, Design, Cost, Sludge, Suspended load, Sedimentation.
Identifiers: *Flotation, *Suspended solids, Loading, Thickening.

A full-scale dissolved air flotation unit designed for solids-liquid separation of an activated sludge mixed liquor was evaluated in a field investigation. The data indicated that conventional design parameters do not adequately predict flotation performance in terms of effluent suspended solids. A new parameter was developed and is proposed a rational design guideline. Conventional design criteria such as the solids loading rate and air solids ratio did not describe flotation performance in terms of the effluent suspended solids. A cost-quality comparison of flotation versus gravity sedimentation with waste sludge thickening indicated that overall planning and performance could have been improved for a substantial economic savings. A savings in tankage volume and area requirements would have resulted from the use of a conventional gravity clarifier with or without waste sludge thickening. If gravity sedimentation had been used, the total costs indicated that the expenditures associated with mixed-liquor solid separation would have been approximately 30% of the flotation costs. As compared to the use of a flotation unit alone, the combination of gravity sedimentation and waste sludge thickening by flotation would have produced a savings of about 48% ($0.03 per thousand gallons). (Hancuff-Texas)

SEWAGE TREATMENT SYSTEM ODORS AND AIR POLLUTANTS,
Stone (Ralph) and Co., Los Angeles, Calif.
Ralph Stone.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 96, No SA 4, p 905-909, August 1970. 3 tab.

Descriptors: *Odor, *Sewage treatment, *Air pollution, *Sewage, Waste water treatment, Aeration, Sludge, Chemicals, Incineration, Sewers, Costs, Activated sludge, Oxidation.
Identifiers: *Odor control, Threshold number, Sewer maintainance, Air pollution control.

The major pollution problem associated with sewerage systems is odor. Sludge or screening incinerators may discharge particulate matter, incompletely combusted or organic compounds and sulfur dioxides all of which are air pollutants. The intensity of sewage odor production is dependent upon the following factors: organic concentration, temperature, sulfate content, detention time, aggetation, microbes, pH, and flow depth. Methods of odor control are: (1) preventing the odors from forming, (2) preventing the odors from reaching the atmosphere, and (3) removing or renovating the odors which have been formed. Odors may be suppressed by: (1) sewer maintainence to remove biological slimes, grease, and silt; (2) addition of oxidation or reduction compound; (3) precipitation of sulfides; (4) waste pretreatment to reduce waste strength; and (5) the use of perfume masking agents. Odors can be prevented from reaching the atmosphere by sealing enclosures and collecting by partial vacuum within the disposal facility. The odors and air pollutants such as particulate matter and nitrogen oxides can be reduced by appropriate afterburners, scrubbers, activated carbon, or other specialized equipment. (Hancuff-Texas)
W70-10027

DETERGENTS (LITERATURE REVIEW),
S. K. Banerji.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 916-920, June 1970. 31 ref.

Descriptors: *Detergents, *Alkylbenzene sulfonates, *Linear alkylate sulfonates, Digestion, Waste water treatment, Sewage treatment, Phosphates, Biodegradation, Degradation (Decomposition), Surfactants.
Identifiers: Methylene-Blue Active Substance.

A review of the 1969 literature on detergents is presented. A European council proposed a ban on detergents which were not 80% biodegradable. A report on the reduction of Methylene-Blue Active Substance in the Illinois river shows a drop from 0.54 mg/l in 1959 to about 0.05 mg/l in 1965. Several studies of the toxic effects of detergents on fish and the synergistic effects when combined with various insecticides is discussed. The mechanisms of detergent biodegradation and biodegradability is reported on by several authors. The role of algae in degrading surfactants is also discussed. A situation regarding anionic detergent toxicity to anaerobic digestion in the United Kingdom is reviewed. The processes for the removal of detergents from waters is included and efficiencies of various methods reported. The role of phosphates as a detergent builder and its eutrification implications are discussed. Boron salts an ingredient of detergents were found to be toxic to laboratory activated sludge units in concentrations greater than 10 mg/l. Environmental effects of the enzymes present in detergents seem to be of some concern. The enzymes were not present in the effluent of conventional waste water treatment plants and were nontoxic to rats at a dosage 10 grams per kg. (Hancuff-Texas)
W70-10028

CHEMICALS, BUGS TAME PROCESS WASTES.

Environmental Science and Technology, Vol 4, No 8, p 637-638, August 1970. 2 fig.

Descriptors: *Industrial wastes, *Waste water treatment, *Activated sludge, Biological treatment, Coagulation, Nutrients, Lagoon, Sludge, New Jersey.
Identifiers: *Polyvinyl chloride, Polyelectrolytes, Pedricktown (New Jersey).

A combination of coagulation and activated sludge treatment is being used by B. F. Goodrich Chemical Company for the treatment of a polyvinyl chloride waste. The waste is milky white and contains various amounts of monomers, polymers, dispersants, organic and inorganic salts, etc., in both suspended and dissolved forms. The one million dollar plant is based on design criteria of 90% reduction of ultimate BOD and flow of 800,000 gallons per day. The primary treatment consists of the addition of coagulant and coagulant aid in two compartment mixing tanks. Ferric chloride is used as a coagulant at a dosage of 150 ppm. Secondary treatment consists of an activated sludge process to which small amounts of nutrients, nitrogen and phosphorus must be added. Caustic soda is also added just prior to the aeration tank to keep the pH above 7. The effluent is then fed to a tertiary lagoon. The settled sludge from both chemical sludge and biological sludge thickners is centrifuged and dewatered to about 40 to 50% solids. The dewatered sludge is inert and trucked to land fill. Goodrich aims at eventually 100% reuse of its water supply but further treatment of the lagoon effluent will be necessary. (Hancuff-Texas)
W70-10030

LAGOONS AND OXIDATION PONDS (Literature Review),
W. C. Boyle.
Journal of the Water Pollution Control Federation, Vol 42, No 6, p 910-916, June 1970. 39 ref.

Descriptors: *Waste water treatment, *Lagoons, *Ponds, Oxidation, Biological treatment, Sewage treatment, Aeration, Temperature, Industrial wastes, Nutrients, Coliform, Efficiency, Poultry, Tertiary treatment.

A review of the 1969 literature on lagoons and oxidation ponds is presented. The review includes discussion of principles of aerated lagoon design. A pilot plant study to treat box-board white water and paper-board mill waste waters is outlined. Discus-

sion of several full scale aerated lagoons is presented and includes the design and cost of treatment. A variety of industrial wastes are treated through pond and lagoons: Kraft mill wastes, pulp and paper mill wastes, refinery and chemical wastes, poultry wastes, hog slaughter house wastes, animal wastes, dairy manure wastes and phenolic wastes. Data are presented on the design, power requirements, organic loadings, efficiencies, effects of temperature, aeration requirements, nutrient requirements, coliform and pathogen removals, and influence of detergents. The use of ponds as tertiary process is also discussed for a variety of wastewaters. (Hancuff-Texas)

FWQA STEPS UP TERTIARY TREATMENT STUDY.
Environmental Science and Technology, Vol 4, No 7, p 550-551, July 1970. 4 fig.

Descriptors: *Tertiary treatment, *Nutrients, Nitrogen phosphorus, Nitrification, Denitrification, Waste water treatment, Biological treatment, Sewage treatment, Chemical precipitation, Pilot plants.
Identifiers: FWQA.

A general description is given of four processes currently being studied at the Advanced Waste Treatment facilities of the FWQA in Washington, D. C. All of the treatment sequences under investigation include processes that have as yet found little or no use in municipal waste water treatment. Three of the sequences include conventional primary treatment and secondary biological processes followed by tertiary nutrient removal steps. Another and independent physical-chemical system relies primarily on non-biological means of organic and nutrient removal. The main features of the treatment sequence which qualify them as advanced waste treatment are the capabilities for phosphate and nitrogen nutrient removal. Two alternative approaches are discussed in regard to the removal of nitrogen: physical-chemical and biological. Physical-chemical treatment is effected through pH adjustment. The pH is increased and the nitrogen stripped as ammonia. The second uses biological treatment to convert the nitrogen from the ammonia form to the nitrate form through nitrification and this is followed by biological denitrification, an anaerobic bacterial process. The independent physical-chemical treatment bypasses the conventional primary and secondary treatment steps; instead the incoming waste water is treated with lime in the two stage clarification process. The effluent from the phosphate removal step is treated in carbon adsorption columns and undergoes physical-chemical nitrogen removal. (Hancuff-Texas)

ARMCO STEEL FACILITY FEATURES POLLUTION CONTROL,
Armco Steel Corporation, Middletown, Ohio.
C. G. Kramer.
Civil Engineering, Vol 40, No 6, p 37-40, June 1970. 4 fig.

Descriptors: *Air pollution, *Waste disposal, *Water reuse, *Concrete construction, Waste water treatment, Industrial wastes, Deep wells, Water pollution control, Soils, Foundations, Groundwater, Ohio.
Identifiers: Middletown (Ohio).

Armco's new Middletown works has been named the outstanding engineering achievement of 1970. Perhaps the most significant aspect of the project is the attention and effort devoted to environmental quality. Altogether 14 separate air and water pollution control systems were planned and developed at a capital cost of nearly $39,000,000. Operation, maintenance and material cost for these systems will be about $4,000,000 per year. At the basic oxygen furnace, a Japanese 'off-gas' system was introduced to the U.S.; by treating dirty carbon monoxide gas before it is oxidized the volume of gases to be treated is reduced 75%, and the size of the gas cooling system is reduced 90%. The plant disposes of its acid wastes by deep well injection. Disposal of the pickle wastes in this way is considered to be both effective and safe. A 100,000 gallon per minute water treatment plant is employed to permit recycling of the water from hot rolling mills. The treatment consists of dosing the ferric sulfate and lime in the flash mix tanks. Additon of coagulant aids in the flocculation tanks is followed by clarification. To date the waste system meets all the objectives, for example, the intake stream has a 171 ppm suspended solids and the water discharge 8 ppm suspended solids. Also featured are imaginative designs in concrete specifications, piles, and strip-mill basements. (Hancuff-Texas)

5E. Ultimate Disposal of Wastes

WASTE DISPOSAL AND EARTHQUAKES AT THE ROCKY MOUNTAIN ARSENAL, DERBY, COLORADO,
Geological Survey, Washington, D.C.
H. K. Van Poolleen, and D. B. Hoover.
Journal of Petroleum Technology, p 983-993, August 1970. 11 p, 11 fig, 3 tab, 32 ref.

Descriptors: *Injection wells, *Earthquakes, *Colorado, Waste disposal, Faults (Geology), Crystalline rocks, Metamorphic rocks, Transmissivity, Porosity, Injection, Safety, Fractures (Geology).
Identifiers: Rocky Mountain Arsenal (Colo), Denver (Colo), Hubbert-Rubey theory, Waste disposal wells.

In early 1962 waste water was injected into a 12,000-ft well drilled in the pre-Cambrian near Denver, Colo. Since that time over 100 earthquakes large enough to be felt have occurred in this area where no quakes had been recorded before (one as high as Richter magnitude 5.3). In 1966 water injection was stopped, but earthquake activity has continued. Several mechanisms explain this phenomenon--the Hubbert-Rubey theory, reduction of coefficient of friction, hydraulic fracturing, and thermal and chemical effects. (Knapp-USGS)

UNDERGROUND WASTE DISPOSAL,
Gurnham and Associates, Inc., Chicago, Ill.
Charles A. Caswell.
Environmental Science and Technology, Vol 4, No 8, p 642-647, August 1970. 6 p, 5 fig.

Descriptors: *Injection wells, Hydrogeology, Waste disposal, Legal aspects, Safety, Environmental engineering.

The technology, hydrology, and legal status of deep disposal wells are briefly reviewed. Injection is ultimate disposal in the sense that wastes are held out of contact with the surface environment for a very long time, long enough to render many wastes harmless by geochemical processes before they reach the surface again. In many cases wastes are made safe enough that underground disposal is a valuable source of aquifer recharge. In many cases, however, injection is not feasible because wastes are too long-lived or the hydrogeology of the disposal horizon is not favorable for safety, long retention, or degradation of the wastes. Legal problems include underground trespass, liability for damage, and ownership of aquifers and groundwater. (Knapp-USGS)

SOME CONSIDERATIONS IN UNDERGROUND WASTE WATER DISPOSAL,
Ohio River Valley Water Sanitation Commission, Cincinnati; and Missouri Univ., Columbia. Dept. of Geological Engineering.
Edward J. Cleary, and Don L. Warner.
Journal American Water Works Association, Vol 62, No 8, p 489-498, August 1970. 10 p, 16 ref.

Descriptors: *Injection wells, *Waste water disposal, *Ohio River, *Industrial wastes, *Regulation, Water law, Monitoring, Hydrogeology, Legislation, Injection, Water wells, Water rights, Reviews, Publications.
Identifiers: Ohio River Basin, Orsanco, Waste disposal wells.

Two sections of a monograph on underground waste water disposal are presented and the entire monograph is briefly discussed. The monograph provides perspective on the status of underground injection practice and the social concerns and policy issues that relate to it, and offers regulatory guidelines and criteria for evaluating the location, design construction, and operation of injection wells, specifically with respect to geological and other circumstances in the Ohio Valley. Legal liabilities and constraints are more important than technical ones. All aspects of the planning, constuction, operation, and abandonment of waste-injection systems should be embraced in the regulatory process. Although only small areas of the Ohio Valley are limited for waste injection on the basis of hydrologic consideration of the rock units, geologic structure, and groundwater circumstances, only limited quantities of wastes should be regarded as eligible for subsurface disposal. Continuous records of waste water volumes and injection pressures should be kept. Monitoring of conditions at the injection interval or other intervals above or below the injection horizon is often desirable. (Knapp-USGS)

CONSERVATION OF FRESH-WATER RESOURCES BY DEEP-WELL DISPOSAL OF LIQUID WASTES,
Alabama Univ., University, Natural Resources Center.
David M. Grubbs, Charles D. Haynes, and William E. Tucker.
Available from NTIS as PB-194 112, $3.00 in paper copy, $0.65 in microfiche. Alabama University Natural Resources Center, and Alabama Geological Survey Report, May 1970. 85 p, 23 fig, 2 tab, 42 ref. OWRR Project No B-019-ALA (2).

Descriptors: *Waste water disposal, *Injection wells, *Alabama, Aquifers, Aquicludes, Hydrogeology, Water law, Legal aspects, Groundwater movement, Permeability, Cost analysis, Water costs, Computer programs, Water conservation.
Identifiers: Waste injection wells.

Geological and engineering parameters which govern the disposal of liquid-waste material by deep-well injection were evaluated in Alabama. A study was made of geology to identify potentially favorable subsurface reservoirs. Physical properties controlling fluid movement and storage, and liquid wastes from industries were injected into core samples of actual reservoir rocks. Parameters required for confinement of wastes to assure the isolation of fresh water and other natural resources from adverse effects of waste injection were studied. A design and cost procedure was supplemented by a computer program to provide rapid feasibility studies. Data provided by wells drilled for oil and gas show several potential receptive horizons in the southwest portion of the state near Mobile. Until definition of legal responsibilities is clarified, disposal of liquid wastes in deep-wells should be undertaken only after study of capacity, permeability, confining beds, and control of the flow stream. Aspecial bibliography is included containing 460 entries. (Knapp-USGS)
W70-09771

CONSERVATION OF FRESH-WATER RESOURCES BY DEEP-WELL DISPOSAL OF LIQUID WASTES, APPENDIX A: DESIGN AND

COST OF LIQUID-WASTE DISPOSAL SYSTEMS,
Alabama Univ., University, Natural Resources Center.
Charles D. Haynes, and David M. Grubbs.
Available from NTIS as PB-194 113, $3.00 in paper copy, $0.65 in microfiche. Alabama University, Natural Resources Center, and Alabama Geological Survey Report, May 1970. 120 p, 36 fig, 2 tab, 21 ref, append. OWRR Project B-19-ALA (3).

Descriptors: *Waste water disposal, *Cost analysis, *Computer programs, *Alabama, Construction costs, Maintenance costs, Capital costs, Design, Aquifers, Hydrogeology, Water conservation.
Identifiers: Waste disposal wells.

Elements of the cost of waste water injection wells include capital outlay, maintenance, and operation. Design is critical to initial capital investment and is a contributing factor in other cost elements. The computer-derived cost of deep-well disposal systems is tempered to meet the physical parameters dictated by the geology of Alabama. An objective of the study is to conserve the fresh-water resource of the State if feasibility of this method of waste disposal can be established. Variable site cost factors include depth of the well, physical properties of the receptive horizon, mechanical limitations of the well design and equipment, and also management decisions with reference to investment in the disposal well and its components related to waste volume and alternate or stand-by disposal means. A computer program affords a flexible procedure for design and estimation of costs of deep-well disposal systems. Although the program is keyed to costs dictated by the geology of Alabama, it is applicable to any area by modification of tables pertaining to drilling costs. (Knapp-USGS)
W70-09772

CONSERVATION OF FRESH-WATER RESOURCES BY DEEP-WELL DISPOSAL OF LIQUID WASTES, APPENDIX B: PART I CHEMICAL REACTIONS BETWEEN ACID INDUSTRIAL WASTES, FORMATION WATERS, AND MINERALS IN SALAQUIFERS OF ALABAMA; PART II, LABORATORY STUDY OF SELECTED RESERVOIR ROCKS,
Alabama Univ., University. Natural Resources Center.
David M. Grubbs, and Travis H. Hughes.
Available from NTIS as PB-194 114, $3.00 in paper copy, $0.65 in microfiche. Alabama University, Natural Resources Center, and Alabama Geological Survey Report, May 1970. 23 p, 3 fig, 5 tab, 11 ref. OWRR Project B-019-ALA (4).

Descriptors: *Water chemistry, *Waste water disposal, *Injection wells, *Alabama, Laboratory tests, Hydrogeology, Porosity, Permeability, Chemical reactions, Chemical precipitation.
Identifiers: Waste disposal wells.

Although the important chemical reactions in waste injection may be predicted, the physical effects of these reactions often are not predictable. Laboratory studies of a variety of reservoir rocks samples were conducted in an effort to establish storage capacity and flow parameters and to assess compatibility of potential receptive horizons with injected liquid wastes. Groundwater reservoirs with physical and chemical parameters favorable to injection of liquid wastes are at moderate depths in the geologic sections in a portion of Alabama. There should be no significant permanent reduction in porosity as a result of injection of sizable volumes of most of the State's industrial wastes. Permeability to continued flow of waste material showed a substantial decrease after a period of relatively few days, but could be restored to a level satisfactory for injection by flushing the aquifer with water. Permeability loss resulting in reduction of injection rates is greatest at the well face. Remedial action may be taken in some instances to restore flow to a suitable level. (Knapp-USGS)
W70-09773

CONSERVATION OF FRESH-WATER RESOURCES BY DEEP-WELL DISPOSAL OF LIQUID WASTES, APPENDIX C: STRATIGRAPHY OF ALABAMA (WITH A SECTION ON PHYSIOGRAPHY),
Alabama Univ., University. Natural Resources Center.
Donald B. Moore, and James Daniel Moore.
Available from NTIS as PB-194 115, $3.00 in paper copy, $0.65 in microfiche. Alabama University Natural Resources Center, and Alabama Geological Survey Report, May, 1970. 56 p, 4 fig. OWRR Project B-019-ALA (5).

Descriptors: *Stratigraphy, *Geomorphology, Alabama, *Geologic formations, Hydrogeology, Rocks, Geological surveys, Geologic time.

The following stratigraphic features of Alabama are briefly discussed: Paleozoic Rocks; Cambrian System; Ordovician System; Silurian System; Devonian System; Carboniferous System; Mississippian Series; Pennsylvanian Series; South Alabama Stratigraphy (Subsurface); Jurassic System; Cretaceous; Paleocene Series; Eocene Series; and Oligocene Series. Alabama lies partly in the following five physiographic provinces: Highland Rim Section of the Interior Low Plateaus, the Cumbeland Plateau Section of the Appalachian Plateaus, the Valley and Ridge, the Piedmont Upland Section of the Piedmont, and the East Gulf Coastal Plain Section of the Coastal Plain.

ON USING INDUSTRIAL AND DOMESTIC WASTES IN AQUACULTURE,
Maryland Univ., Solomons. Natural Resources Inst.
J. A. Mihursky.
Agricultural Engineering, Vol 50, No 11, p 667-689, 1969. 1 fig, 3 tab, 18 ref.

Descriptors: *Waste disposal, *Aquaculture, *Ultimate disposal, Domestic wastes, Industrial wastes, Sewage wastes, Byproducts, Fertilizers, Algae, Zooplankton, Fish, Shellfish, Steam, Electric power, Heated water, Proteins, Aquatic microorganisms, Temperature, Activated sludge, Fisheries, Carp, Clams, Ponds, Running waters, Fresh water, Brackish water, Economics, Cycling nutrients, Foods.
Identifiers: Petroleum wastes, Mercenaria mercenaria, Aquaculture, Recycling wastes.

Three waste materials have the greatest potential for recycling through aquatic systems into useful nutrients--petroleum wastes, sewage wastes, and waste heat. Protein developed and sold in France is produced by microorganisms growing on waste low-grade petroleum. Large-scale use of microbiologically derived proteins seems possible. Sewage converted to inorganic materials may provide fertilizer for algal production. Waste heat may assist in providing optimal environmental conditions for biological growth at all trophic levels. In various world situations sewage or sewage products are used to stimulate fishery production. Algae grown in mass aided by water from treated sewage and concentrated by evapodrying technique produces food for chickens. Waste heat from steam electric stations is used to raise carp in latitudes farther north than usual and to extend the growing season in some localities. A waste flue gas was used to supply carbon dioxide gas to mass-culture an algal food supply. Wild or natural water is preferable to pond culture. Running water systems permit dense stocking, waste removal and continued dissolved oxygen renewal. Costs of producing fish protein concentrate through aquaculture plus waste utilization will be subsidized by society's need to recycle its waste materials into useful foodstuffs. (Jones-Wisconsin)

LAND SPREADING, A CONSERVING AND NON-POLLUTING METHOD OF DISPOSING OF OILY WASTES,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Ohio Basin Region.
G. K. Dotson, R. B. Dean, W. B. Cooke, and B. A. Kennar.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 15 p, 4 fig, 4 tab, 20 ref.

Descriptors: *Oils, *Oil waste, *Waste water disposal, *Soil microorganisms, Microorganisms, Bacteria, Fungi, Soils, Efficiencies, Laboratory tests, Test procedure.
Identifiers: *Land disposal.

Land spreading is shown to be economical and comparitively fool proof method of disposing of oily wastes. Although large additions of oil may create toxic conditions for plants the eventual effect upon soil is to provide physical and chemical properties by increasing organic matter and nitrogen content, decreasing volume weight and increasing porosity and moisture holding capacity. Soil microbes can oxidize and decompose large quantity of petroleum hydrocarbons under a wide range of soil and environmental conditions. Natural biochemical decomposition of oil in soil may be accellerated by judicious use of lime and fertilizer, artifical drainage and tillage. Microbiological degradegration of oily wastes take place under a wide range of temperature but oxidation is faster in warm or hot climates than in cold. A typical land disposal practice is described for an oil-water separator sludge consisting of an emulsion with about 20% hydrocarbon, 25% solid and 55% water. Various microbiological studies are reported in regard to the number and types of oil decomposing bacteria and fungi. (Hancuff-Texas)

5G. Water Quality Control

REPORT ON THE FEDERAL-STATE-INDUSTRY COOPERATIVE SAVANNAH RIVER WATER QUALITY STUDIES, 1956-1965.
Public Health Service, Atlanta, Ga. Savannah River Advisory Board.

U S Dept of Health, Education and Welfare, Public Health Service Report, November 1967. 173 p, 25 fig, 11 tab, 19 ref.

Descriptors: *Radioactive waste disposal, *Georgia, *Water quality, Radioactive wastes, Path of pollutants, Water chemistry, Monitoring, Sampling, Water quality control.
Identifiers: Savannah River.

From results of the U.S. Public Health Service studies, South Carolina and Georgia surveillance activities, Du Pont monitoring, and other related surveys and investigations, it is concluded that radioactivity releases to the Savannah River from the Savannah River Plant have been maintained well below the established guides and standards for radioactivity in the environment. The low activity levels attained reflect good waste management practices at the plant. The surveillance now being provided is adequate to take care of public health and other interests. The States are continuing their

cooperative program, comparing results with those obtained in Du Pont monitoring program. (Knapp-USGS)

MATHEMATICAL MODELLING OF WATER QUALITY CHANGES IN A RIVER BASIN,
Hydraulic Research Inst., Brno (Czechoslovakia).
Vladimir Novotny.
Fifth International Water Pollution Research Conference, San Francisco, July 26-Aug 1, 1970, p I-5/1 - I-5/7. 4 fig, 5 ref. Preprint.

Descriptors: *Impaired water quality, *Mathematical models, *Natural streams, *Self-purification, Water temperature, Biochemical oxygen demand, Dissolved oxygen, On-site data collections, Digital computers.
Identifiers: *Non-conservative pollutants, Steady state, Dynamic state.

Problems and design are discussed of a suitable mathematical model which would apply for small and medium streams. Water quality as related to non-conservative pollutants in steady state and dynamic state were discussed and modeled. A river network was divided into sections connected by junction and it was assumed that self-purification processes took place in the sections while waste effluent and tributaries were situated at junctions. The input parameters included water temperature, length of section, approximate function of dependence of detention time in section on discharge, the dependence of average depth on discharge, parameters of limiting concentrations of BOD, COD, etc. The dynamic water quality model is more time consuming and needs of greater computer storage capacity than the steady state model. Observed data are in good agreement with the models. (Hsieh-Vanderbilt)

THE CONTROL OF RIVER HEATING BY ACCURATE DIGITAL SIMULATION,
Motor-Columbus Engineering Co., Baden (Switzerland).
P. Bogh, and H. Zund.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 10-14, 1970, Vol. SM-146, No 45, Preprint. 14 p, 4 fig, 4 ref.

Descriptors: *Thermodynamic behavior, *Nuclear powerplants, *Computer programs, Mixing, Cooling water, Cost-benefit ratio, Cooling towers, Model studies, Velocity, Water temperature, Meteorological data, Air temperature, Heat transfer, Hydraulic systems, Digital computers, Solar radiation, Evaporation, Condensation, Convection.
Identifiers: *Switzerland, River geometry.

The thermodynamic behavior of rivers and river systems was carefully investigated in Switzerland, a country without access to the sea and dependent on river cooling for economic nuclear power generation. To approach the problem, it was decided to prepare a digital simulation to reproduce the thermodynamic behavior of the rivers. The program specially developed for this application allowed for the variation of all basic parameters in such a way that the comparison between measured and computed river temperatures would permit the improvement of the heat transfer coefficients. The program allowed for tributaries with variable temperatures, several different time-varying meteorological conditions along the river, heat sources with time-variable intensity, variable river geometry, and simulation of the dispersion by having two channels with different water velocities. A time interval of just one half an hour in the simulation permitted a close watch on the important daily temperature variations. The results showed the importance of daily temperature variations in adjusting the heat transfer coefficients. (Osborne-Vanderbilt)

THERMAL STANDARDS IN THE UNITED STATES OF AMERICA,
Federal Water Pollution Control Administration, Duluth, Minn. National Water Quality Lab.
D. I. Mount.
Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 10-14, 1970. Vol SM-146, No 15, Preprint, 5 p.

Descriptors: *Temperature control, *Standards, *Water temperature, Seasonal, Monthly, Aquatic life, Interstate rivers, Hypolimnion, Volume, Mixing, Safety, Water cooling, Anaerobic conditions, Algal control, Spawning, Warm-water fish.

Temperature standards specifying permissible water temperatures for interstate rivers and lakes of the United States have been established. Standards for aquatic life must insure a seasonal temperature cycle, and so twelve maximum monthly temperatures are the minimum to describe desired conditions. In streams, a 5F rise may be permitted as long as the resulting temperature does not exceed the appropriate monthly maximum. In lakes, a 3F rise may be used with an additional requirement that the hypolimnion cannot be warmed or changed in volume. Mixing zones pose a difficult regulatory problem. They are difficult to restrict as to size and shape especially because the effects of mixing zones on receiving water depends, in part, on the number of mixing zones and the size of the lake or river. Where cooling devices are required, the standards do not specify the type to be used. The frequency that devices will not meet the standards has not been well defined except in a general way. If no safety margin is permitted, standards must be more complex in order to insure acceptable conditions. (Osborne-Vanderbilt)

DETROIT SEWER MONITORING AND REMOTE CONTROL.
Detroit Metropolitan Water Services, Mich.

In: Combined Sewer Overflow Abatement Technology, A Compilation of Papers Presented at the Federal Water Quality Administration 'Symposium on Storm and Combined Sewer Overflows,' p 219-290, June 22-23, 1970. 33 fig, 4 tab. FWQA Project 11020 FAX.

Descriptors: *Overflow, *Remote control, *Regulated flow, *Sewers, Storm drain, Water pollution control, Flood control, Instrumentation, Computers, Cost, Urbanization.
Identifiers: *Combined sewers, *System monitoring, Storm flow anticipation, First flush interceptor, Selective retention, Selective overflowing.

Detroit is faced with the problem of preventing pollution of the Detroit and Rouge Rivers from its combined sewer system overflows. As an alternative to undertaking a dubiously effective sewer separation program, estimated to cost in excess of two billion dollars, the Detroit Metro Water Department has installed the nucleus of a sewer monitoring and remote control 'System' for controlling the pollution from the combined overflow from many small storms at a cost of slightly over two million dollars. The 'system' includes telemetering rain gages, sewer level sensors, overflow detectors, a centrally located computer and data-logger, and a centrally located operating console for controlling pumping stations and selected regulating gates. Installation has been virtually completed and now enables applying such pollution control techniques as 'storm flow anticipation,' 'first flush interception,' 'selective retention,' and 'selective overflowing.' An evaluation of the effectiveness of this initial installation will serve as the basis for determining what additional pollution control facilities are required, what suburban monitoring and remote control is essential, what computer related equipment for pump and valve control can be used for more effective pollution control, what automatic sampling and analysis will be more valuable in the synchronous operation of the sewerage system and what design parameters should be used in the construction of new or supplemental sewers or treatment facilities. SAN FRANCISCO BAY IS NOW PRE-SHRUNK,
Thomas H. Harris.
In: All clear, Winter 1969, p 17-20, 3 photo, 1 map.

Descriptors: *Water pollution control, *Water quality control, *Entropy, Inter-agency cooperation, Sewage treatment, Standards, Financing, Attitudes.
Identifiers: *San Francisco Bay, Bay Conservation and Development Commission, Environmental quality.

The once shrinking San Francisco Bay is staging a comeback. Since the initiation of a pollution control program in 1956, $400 million have been spent jointly by the Federal and State governments. Progress has been slow but it can be seen in oil free waters, more abundant fish and shellfish, and in a reduction in the flow of organic material. The San Francisco Regional Water Quality Control Board, chiefly responsible for the program has set new standards for turbidity and discoloration of receiving waters, and limits have been set on thermal pollution from power plants and industrial sources. Planned actions include requirements that all ships and watercraft be equipped with self-contained sewage holding systems and with provisions to connect to dockside receiving tanks. A 30 year, $2 billion, joint collection and tertiary treatment system for the entire Bay Area is also envisioned. The problems are not all solved, however. San Francisco still has an antiquated combined storm drain-sewer, and in many areas sewage is only given primary treatment. Water quality standards are not being met at most discharges and existing standards are also outdated. All of these programs need tremendous public spending in order to be successful. Vocal citizens and conservationists have caused the establishment of a permanent body, the Bay Con-

servation and Development Commission, to legislatively protect the Bay. It remains to be seen whether the public is willing to put their money where their mouths have been. (Marriott-Chicago)

WATER POLLUTION: GREATER CALUMET AREA-INDIANA-ILLINOIS.
League of Women Voters of Chicago, Ill.

League of Women Voters of Chicago, Chicago, April, 1966. 16 p, 35 ref, 2 fig (Mimeographed).

Descriptors: *Pollution abatement, *Illinois, *Indiana, *Pollutant identification, *Water users, *Industrial wastes, Sewage, Waste treatment, Federal Water Pollution Control Act.
Identifiers: *Greater Calumet Area, *Metropolitan Sanitary District of Greater Chicago, *Public Health Service, *Federal Water Enforcement Conference, Thomas J. O'Brien Locks, Calumet River, Water quality criteria, Lake Michigan Basin, Illinois River Basin.

The water pollution problems of the Great Calumet Area are reviewed utilizing resource material, a summary of a U.S. Public Health Service Report (Dec. 1964) and a resume of the 1965-66 Federal Water Enforcement Conference held in Chicago. The Greater Calumet Area is defined, and definitions of pollution are given for the area within the Metropolitan Sanitary District of Greater Chicago and for the remainder of Illinois. While there is no specific federal statute that defines pollution, Congress has legislative authority, and the Federal Water Pollution Control Act gives the federal government responsibility for control and prevention. Findings and conclusions of the U.S. Public Health Report are reviewed. With regard to water users, facts are included concerning municipal water supply, industrial water supply, waste disposal and assimilation, waterborne commerce, recreation, and aesthetics. Industrial and sewage wastes are concluded to be principal pollutants although others are mentioned as significant at times. Findings regarding the percentage of each in the Illinois River Basin and the Lake Michigan Basin are listed. The purpose, legal basis, and conferees at the Federal Enforcement Conference held in March 1965 at Chicago are mentioned. Review is included of testimony from federal, state and MSD representatives. Interstate abatement efforts are agreed to be inadequate and eight standards for immediate remedial action recommended. Included are evaluation of water quality criteria, necessity of at least secondary treatment, minimization of industrial discharges, development of time schedules for constructing waste treatment facilities, sampling of industrial effluent, closing of Thomas J. O'Brien locks on the Calumet River and surveillance of the recommendations by conferees. (Preckwinkle-Chicago)

OPTIMAL TAXING FOR THE ABATEMENT OF WATER POLLUTION,
Cornell Univ., Ithaca, N.Y.
Jerome E. Hass.
Water Resources Research Vol 6, No 2, p 353-365, April 1970.

Descriptors: *Water pollution, *Taxes, *Water quality, *Economic evaluation, Planning, Optimization, Cost, Treatment costs, River basin, Waste disposal, Dissolved oxygen, Management, Income, Mathematical studies, Model studies, Organic waste, Streamflow, Flow rate, Rivers, Total cost
Identifiers: *Dantzig-Wolfe algorithm, *Miami River, *Externalities, Income redistribution.

This paper is concerned with the use of taxes to internalize the costs of pollution. The analysis considers the role of a central authority and provides justification for the imposition of pollution taxes to elicit optimal treatment behavior from each polluter within a basin. The author then derives a rudimentary river basin model that incorporates the fundamental hydrological characteristics of the basin, the imposition of dissolved oxygen standards, and the effects of treatment of organic waste and low flow augmentation on the dissolved oxygen content of a river. This is a mathematical programming model which must be solved by the central authority. The analysis further demonstrates how the Dantzig-Wolfe non-linear decomposition algorithm can be used to achieve the standards imposed at minimum cost to society and to determine the tax structure required to achieve this solution. (Murphy-Rutgers)

DEVELOPING A HYDRO-QUALITY SIMULATION MODEL,
Utah Water Research Lab., Logan.
Neal P. Dixon, David W. Hendricks, A. Leon Huber, and Jay M. Bagley.
Available from NTIS as PB-194 065, $3.00 in paper copy, $0.65 in microfiche. Utah Water Research Laboratory Report PRWG67-1, June 1970. 87 p, 58 fig, 20 tab, 77 ref, 8 append. FWPCA Project 16090 DWR---6/70.

Descriptors: *Systems analysis, *Simulation analysis, *Model studies, *Water quality, *Reservoirs, River basins, Dissolved oxygen, Biochemical oxygen demand, Conductivity, Water temperature.
Identifiers: *Computer requirements, *Program options, *Utah State University.

The development of a river basin simulation model comprising dissolved oxygen, temperature, specific electrical conductance, and basin hydrology submodels is demonstrated. The system model is the device for studying practical questions involving some measure of efficiency - whether this be pollution minimization by treatment and flow regulation, maximizing water use with the quality constraint, maximizing economy efficiency, or in developing more comprehensive water laws. These questions can be ascertained by simulation of altered conditions, sensitivity analysis, or some optimization technique. Although the model in this report was developed for a specific prototype system, the Little Bear River in Utah, the approach, the methods and the conceptual framework can be transferable to other systems. RAPID-FLOW FILTER FOR SEWER OVERFLOWS.
Rand Development Corp., Cleveland, Ohio.

Available from NTIS as PB-194 032, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration Research Series, August 1969. 82 p, 10 fig, 12 tab, 4 ref. append.

Descriptors: *Storm drains, *Sewers, *Overflow, *Solid wastes, *Filters, Research and development, Model studies, Storm runoff.
Identifiers: *Rapid-flow filter, *Combined sewer overflows, Suspended solids, Settleable solids.

In a pilot installation up to about 65% of solids from overflows of combined sewer systems were removed by using lump coal as a rapid-flow filter. The lump coal was sized to three-fourths by one and one-fourth inches, free of fines, and about eight inches in depth. The overflow is directed onto the filter bed in such a manner that the filter bed is not displaced. When plugged, or upon a routine basis, the filter bed is replaced; the spent bed, composed of coal and solids, is incinerated or landfilled or disposed of by whatever manner is locally in use which does not pollute the atmosphere or surface or underground waters. The potentially most valuable contribution in the work was the finding that conventional sewage sampling does not provide a representative indication of the nature of large solids content. A recommendation for an improved sampling procedure is made. (Woodard-USGS)

ENVIRONMENTAL QUALITY AND THE ILLINOIS LAWYER,
John L. DeLaurenti.
Illinois Bar Journal, Vol. 50, p 605-615 (1970). 7 p.

Descriptors: *Illinois, *Environment, *Environmental effects, *Conservation, Resource development, Administrative agencies, Legal aspects, Pollution abatement, Water pollution, Air pollution, Soil contamination, Thermal pollution, Governments, Federal government, State governments, Local governments, Air pollution effects, Regulation, Water pollution effects, Coordination.
Identifiers: *Associations.

The Board of Governors of the Illinois State Bar Association has authorized the creation of an Environmental Control Law Section. A few of the environmental problems recognized by the Section council are: (1) air pollution; (2) water pollution; (3) lethal contamination from pesticides; (4) nuclear radiation; (5) noise; (6) land use; (7) continuing need for historic conservation activities; (8) scrap, junk and solid wates; and (9) population density. A brief discussion of each problem is presented. Most of these problems are under study by various federal agencies, often working without coordination. The lack of agency coordination also exists at the state and local level. The problem of direction and control within Illinois agencies is examined. One of the recent international developments has been the passage of Canadian legislation proscribing the use of the pesticide DDT except in emergency cases. The role of the legal system and lawyers in solving environmental problems will be one of developing a new set of standards which are workable and practical, yet effective. (Powell-Florida)

REPORT TO THE CITY OF FLINT, MICHIGAN ON SANITARY AND STORM SEWER SYSTEMS.
Metcalf and Eddy, Inc., Boston, Mass.

Report to Department of Public Works and Utilities, City of Flint, Michigan, September 12, 1969. 159 p, 11 fig, 12 tab, 11 ref.

Descriptors: *Sanitary engineering, *Sewers, *Sewerage, *Flow separation, *Infiltration, *Drainage systems, *Drainage practices, *Drainage engineering, *Urbanization, *Municipal wastes, *Pollution abatement, *Storm runoff, *Water pollution control, Sewage treatment,

reatment facilities, Flood protection, Flood plan oning, Construction costs, Future planning.
dentifiers: *Combined-sewer separation, *Sanitay sewers, Basement flooding.

he report describes the study procedures and resents the findings, conclusions, and recommenations of an engineering investigation of the dequacy of the sanitary sewer and storm sewer ystems and the waste water disposal facilities of he City of Flint. The sewer systems performed heir present functions satisfactorily; however, ajor problems were: (1) basement flooding, (2) iver pollution, and (3) potential flooding from fuare stormwater discharges from adjoining ownships. In addition to recommendations for ystem improvements and expansion of existing acilities, several far-reaching and unconventional ecommendations were made. One of these is to eparate the downtown combined-sewer system by onstructing a new storm sewer system in this area nd converting the existing combined-sewer to a eparate sanitary sewer. This construction, estiated to cost $2 million, should be effective in educing river pollution and basement flooding om overflows of the present combined-sewer. nother recommendation is to remove all connecons to sanitary sewers from roof drains, foundaon drains, and parking lots. The City should enact egislation to prohibit future connections to the anitary sewer system from foundation drains or ther sources of surface water or groundwater. pecial field investigations of surface and groundater infiltration into existing sewers are also ecommended. A $30,644,000 construction and mprovement program is proposed. The need for ooperation between Flint and Genesee County is tressed, particularly for rainfall and runoff data ollection and flood plain conservation. (Poertner)

HE IMPACT OF THE DEEP TUNNEL PLAN ON THE WATER RESOURCES OF NORTHEAST ILLINOIS.
Harza Engineering Co., Chicago, Ill.; and Bauer Engineering, Inc., Chicago, Ill.

Report to Metropolitan Sanitary District of Greater Chicago, Chicago, Illinois, February 1969. 49 p, 13 fig, 3 ref.

Descriptors: *Tunnels, *Underflow, *Beneficial se, *Underground storage, *Drainage programs, Drainage effects, *Drainage engineering, *Storm unoff, *Surface runoff, *Urbanization, *Water onservation, *Flood control, *Water supply, Water table, *Water resources development, Water pollution control, *Lake Michigan, Sewers, *Resource allocation, *Groundwater echarge, Drainage systems, Navigation, Deep vells, Water allocation.
dentifiers: *Chicago, *Metropolitan Sanitary District of Greater Chicago, *Combined sewer overlows.

The anticipated consequences are described of implementation of the proposed innovative plan for liminating flooding and reducing pollution of waterways from combined sewer overflows in the ervice area of the Metropolitan Sanitary District of Greater Chicago. The plan proposes the conruction of the vertical shafts, and excavation of unnels and storage areas in solid rock deep eneath the ground surface for temporary storage of stormwater runoff which presently floods basenents and streets when sewer capacities are exeeded. Upon cessation of a storm the stored water would be pumped to the ground surface and then to ne of the District's waste water treatment plants or tertiary treatment. The capture of this runoff would make available for beneficial uses an estinated 260 cfs of water. In addition, implementaion of the plan should make possible a 230 cfs eduction in the 945 cfs presently diverted from ake Michigan for maintenance of sanitary condiions in the area's waterways. These savings would ncrease the available water supply by 490 cfs. This s one-half of the forecasted additional water supply that will be required by the year 2000. Other beneficial effects are discussed including: improvements in navigation on the Illinois Waterway, elimination of stream pollution from combined-sewer overflows, and recharge of the area groundwater supply. The basic principles of the plan are discussed, and an evaluation of the plan by the Illinois State Water Survey is included. (Poertner)

POLLUTION AND FLOOD CONTROL, A PROGRAM FOR CHICAGOLAND.
Harza Engineering Co., Chicago, Ill.; and Bauer Engineering, Inc., Chicago, Ill.

Report to Metropolitan Sanitary District of Greater Chicago, Chicago, Illinois, February 1968. 39 p, 7 fig, 2 tab, 5 ref.

Descriptors: *Drainage programs, *Drainage engineering, *Water pollution control, *Flood control, *Tunnels, *Underflow, *Storm runoff, *Surface runoff, *Urbanization, *Lake Michigan, *Drainage systems, *Underground storage, *River regulation, *Sewers, Construction costs, Waste water, Water conveyance, Water quality control, Water pollution treatment, Hydroelectric power.
Identifiers: *Combined sewer overflows, *Chicago, *Metropolitan Sanitary District of Greater Chicago.

A general description is presented of an innovative program for control of water pollution and flooding in the service area of the Metropolitan Sanitary District of Greater Chicago. The report describes the objectives, functions, operation and characteristics of the proposed system, construction time schedules, and estimated construction costs. The plans provide for the construction of vertical shafts to convey overflows, from each of the 400 overflow points of the existing combined sewers, to high velocity conveyance tunnels excavated in rock several hundred feet beneath the ground surface. The overflows would be stored temporarily in a huge reservoir to be excavated in rock 850 feet below Lake Calumet. Upon cessation of overflow and during off-peak hours, the stored water would be pumped to a surface reservoir and then to a treatment plant for treatment prior to discharge to the waterway. The $1,270,000,000 project is proposed to be constructed in 5 construction zones within a 300 square mile area during a 10-year period. The first zone would be completed by early 1973 if construction is begun in early 1970. Hydroelectric power generation is proposed as a part of the system operatin. Cost comparisons with three alternative solutions are given. The engineers estimate that the proposed system can be completed to meet water quality standards of the State of Illinois by the 1977 time limit. (Poertner)

DYNAMIC PROGRAMMING AND ESTUARINE WATER QUALITY CONTROL,
Rice Univ., Houston, Tex. Dept. of Environmental Science and Engineering.
Robert T. Keegan, and J. Venn Leeds, Jr.
Water Resources Bulletin, Vol 6, No 2, p 235-248, March-April 1970. 14 p, 5 fig, 2 tab, 12 ref.

Descriptors: *Dynamic programming, *Optimization, *Estuaries, *Water quality control, *Mathematical models, Constraints, Stochastic processes, Dissolved oxygen.
Identifiers: Algorithm, Langrangian problem, Allocation problems, Galveston Bay System.

An optimization algorithm that allowed one to consider multidimensional water quality models, area growth and various control or decision alternatives for the Galveston Bay System was developed. The problems were formulated as allocation problems and were solved using dynamic programming. The solution to the allocation of resources problem of minimizing (or maximizing) a given scalar valued function of the positive N-vector w subject to constraints upon the use of the resources was obtained by solving the Langrangian problem for a given set of Langrangian multipliers Control or decision variables were included at each activity. The general deterministic water quality problem was formulated to minimize cost of waste treatment and of distribution subject to constraints on quality and to constraints on the maximum amount of waste to be discharged. To illustrate the algorithm the simplest permissible model was used. Stochastic effects and the use of a two-dimensional model were included. Data from the Tracor report on Galveston Bay were selected in order to simulate, to some extent, the water quality of the Houston Ship Channel. The dissolved oxygen deficit resulting from the complete discharge of the wastes was shown . (Kriss-Cornell)

AERATION OF OXYGEN-DEFICIENT IMPOUNDMENT RELEASES,
New Mexico State Univ., Las Cruces.
R. E. Speece.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970, Preprint. 11 p, 8 fig, 5 ref.

Descriptors: *Aeration, *Oxygen demand, *Impoundments, *Dissolved oxygen, Water quality, Hypolimnion, Nitrogen, Bubbles, Injection.
Identifiers: *Water releases, U-tube aeration.

Commercial oxygen is presently competitive with conventional aeration systems in river and impoundment aeration. In addition complete dissolved oxygen saturation can easily be achieved using commercial oxygen whereas conventional aeration becomes increasingly uneconomical above about 40% saturation. In-place hypolimnion

aeration accomplished by injecting small bubbles of commercial oxygen deep in the hypolimnion can provide for complete absorption of the oxygen. Localized mixing for distribution of the dissolved oxygen within the hypolimnion is created by the rising bubbles before they are completely absorbed. Provision to inject into the penstocks of a high dam in combination with inplace hypolimnion aeration can provide a polishing system for positive DO control in the discharge. U-tube aeration with air injection appears to be most advantageous for DO addition where a warm water fishery is involved. It can produce a completely saturated water easily and economically even though it initially contains low DO levels. Intermediate levels of saturation are easily produced by regulating the U-tube depth and rate of air injection. U-tube aeration with air injection does not lend itself to applications where dissolved nitrogen must be below 104%. Aeration of oxygen defficient impoundment releases for improvement of water quality appears to be feasible on a large scale without destratifying the impoundment. Thus the reserve of colder water in the hypolimnion is kept intact for control of downstream temperatures. (Hancuff-Texas)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE: VOLUME I - INTRODUCTION.
Texas Water Development Board, Austin.

Available from NTIS as PB-193 862, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Report 118, May 1970. 83 p, 16 tab, 29 fig, 7 ref, append. OWRR Project C-1377 (No 1975) (1).

Descriptors: *Simulation analysis, *Optimization, *Computer programs, *Planning, *Management, Systems analysis, Reservoirs, Water resources, Texas.
Identifiers: Transfer links.

The research project developed applied new and existing techniques to the planning of complex water and related land resource systems of the Trans-Texas Division of the Texas Water Plan, a system of major proportions that involved many reservoirs, canals, and pumping facilities spanning the state of Texas. The planning problem posed was how best to develop such a system, given the necessity to meet the predetermined demand schedule over the 50-year planning horizon. Such questions as: when should elements of the system be constructed and available for service; how large should they be; how much water should be imported; and others were posed. To provide the planner with some objective and reliable means for answering such questions and for investigating systematically the alternatives presented, the systems approach technique used utilized four specialized computer programs: Stage Development, Simulation Program I, Simulation Program II and the Allocation Program. The screening procedure which used these four programs was divided into four distinct phrases: Element Sizing and Reservoir Operating Rules, Initial Screening using the Stage Development Program, Secondary Screening to refine the schedule and improve element sizes, and Final Screening using the Allocation Program where actual inputs and demands over the planning horizon were used and constraints imposed. The significant conclusion given was that the approach, developed and tested, for the screening of alternative water resource development plans, was efficient and feasible. A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE: VOLUME II-A - SIM-I - PROGRAM DESCRIPTION.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 086, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol II-A - SIM-I Program Description, August 1969. 143 p, 13 fig, 12 tab, 4 append. OWRR Project C-1377 (No 1975) (2).

Descriptors: *Simulation analysis, *Computer programs, *Reservoirs, *Conduits, *Optimization, Design data, Management, Texas, Water storage, Water transfer.
Identifiers: Stage-development program.

A full description of SIM-I; the annual stage-development and seasonal operation of the predefined multi-basin water resource storage and transfer scheme of the Texas Water Plan, was given. The program computed seasonal spills and deficiencies, storage levels, river flows, and pump-canal transfer rates, and then computed costs for pump power, imported water, and staged construction of storage and transfer facilities. System geometry, cost data, and hydrologic data were input parameters. SIM-I was an efficient method for evaluating the operational feasibility and costs of alternative system configurations and constraints for the generalized multi-basin system of reservoirs and conduits. The program was designed to operate as a stand-alone analysis tool or to operate as a subprogram in the stage-development program. Simulation of the system operation was described by a series of steady state solutions, one for each time step, that satisfy continuity for all storage elements. Data requirements, program capabilities, and program descriptors were given for the system. (See also W70-09511) (Kriss-Cornell)
W70-09512

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE: VOLUME II-B - SIM-II PROGRAM DESCRIPTION.
Texas Water Development Board, Austin, Texas.

Available from NTIS as PB-194 087, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol II-B - SIM-II Program Description, Aug 1969. 120 p, 5 fig, 14 tab. OWRR Project C-1377 (No 1975) (3).

Descriptors: *Simulation analysis, *Optimization, *Computer programs, *Cost, *Time, Water transfer, Management, Texas.
Identifiers: Nodes, Links.

SIM-II was a computerized procedure designed to simulate and optimize certain behavioral characteristics and aspects of the large scale surface water distribution system of the Texas Water Plan. The computer program simulated the storage response of the system while at the same time minimized the total cost of material transfer within the complicated network. A solution was produced for each finite time interval with analysis moving forward in a step-wise fashion. SIM-II was more flexible and realistic than SIM-I but with higher cost of operation. It used less computer time than the Allocation Program but solutions were only a series of suboptimal time step solutions, not solutions over an entire time span. Six solution steps were followed and two primary analytical tasks were performed: simulation of storage levels and determination of intersystem transfers to meet storage levels at minimum cost. SIM-II could simulate and optimize a network with up to 30 nodes and 45 links. Mathematical descriptors, data requirements, program capabilities and program descriptions were given. (See also W70-09511) (Kriss-Cornell)
W70-09513

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE: VOLUME II-C - ALLOCATION PROGRAM DESCRIPTION.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 088, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol II-C - Allocation Program Description, Aug 1960. 168 p, 12 tab, 9 fig. OWRR Project C-1377 (No 1975) (4).

Descriptors: *Optimization, *Computer programs, *Reservoirs, *Canals, *Networks, Flow, Cost, Time management, Texas.
Identifiers: *Allocation program, Out of kilter algorithm.

An Allocation Program was used to find the minimum cost way of transferring water through a network of reservoirs and canals, the sizes of reservoirs and canals, and reservoir operating rules for use in Simulation programs. The problem was structured as a network flow problem and then solved by the 'Out of Kilter Algorithm'. The results included, for the time period simulated, all canal and river flows, reservoir storage levels, import quantities, and power needs. The marginal costs of the canal and reservoir sizes were also determined. A trial and error process sized the facilities and was used to check the timing of their construction. A complete description of the program was given. (See also W70-09511) (Kriss-Cornell)
W70-09514

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE: VOLUME II-D - STAGE DEVELOPMENT PROGRAM DESCRIPTION.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 089, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol II-D - Stage Development Program Description, Aug 1969. 89 p, 9 fig, 10 tab. OWRR Project C-1377 (No 1975) (5).

Descriptors: *Optimization, *Simulation analysis, *Project planning, *Time, *Cost, Variability, Reservoirs, Canals, Management, Texas.
Identifiers: *Stage development.

The Stage Development PROGRAM, AS PART OF THE OVERALL Texas Water Plan, was used to estimate the sequence of project construction over a 50 year planning horizon in order to produce the least costly system of reservoirs and canals, and satisfy the demand for water. The planning horizon was divided into 3 periods consistent with the political and physical constraints. Three different calculations involved: (1) net hydrologic balance giving storage needs as a function of time; (2) random sampling of possible construction start times of system elements with the costs of each element estimated using simulation; and (3) a deterministic sequential search using simulation to improve a given set of possible start times. The entire simulation was thought of a s a system response function: th independent variables of the function were reservoir and canal construction times and the dependent variables were the present value of construction and operation costs of the water resource project and cumulated project shortages over the planning horizon. Simulation and Allocation programs were used. (See also W70-09511) (Kriss-Cornell)
W70-09515

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE - VOLUME III - DATA MANAGEMENT.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 090, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol III - Data Management, Aug 1969. 229 p, 10 fig. OWRR Project C-1377 (No 1975) (6).

Descriptors: *Data processing, *Simulation analysis, *Optimization, *Computer programs, Data storage and retrieval.

Data management activities for the Texas Water Plan were developed to assist in data preparation for the system's simulation study. It provided the user with a problem-oriented and easily used set of computer programs for supplying most of the information required by the simulation and optimization programs. Four computer programs resulted: Curfit-I, Tapewrite II, Update I, and Portgen I. They functioned in a way designed to insure the proper generation of a single comprehensive tape file capable of supplying input to the simulation and optimization programs. The programs consisted of computer coded instructions that read data cards containing information prepared by the user on problem-oriented input data forms. The programs were used separately but could function as an integrated set of programs. All four programs were described in detail and mathematical descriptions were used. (See also W70-09511) (Kriss-Cornell)
W70-09516

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE - VOLUME IV - USERS MANUAL.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 091, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol IV - Users Manual, Aug 1969. 195 p, 16 fig. OWRR Project C-1377 (No 1975) (7).

Descriptors: *Computer programs, *Simulation analysis, *Optimization, *Data collection.

The Users Manual provided a reference document that describes how to use the following computer programs: Curfit I, Tapewrite II, Update I, Portgen I, SIM-I, SIM-II, Allocation Program and Stage Development Programs. The descriptions for each of the programs included: (1) statements of purpose; (2) explanation of capabilities, limitations, and assumptions; (3) presentation of problem-oriented input forms; (4) descriptions of the data required on the input forms; (5) discussion of the card sequencing requirements; (6) presentation of examples of printer output generated by each of the programs; and (7) a description of the contents of the common input tape file used with the SIM-I, SIM-II, Allocation and Stage Development Programs. The descriptions reflected the capability of the programs which were debugged and tested on the UNIVAC 1108 using a single comprehensive example problem. (See also W70-09511) (Kriss-Cornell)
W70-09517

A COMPLETION REPORT ON SYSTEM SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE - VOLUME-V - STOCHASTIC DEMAND PROGRAM DESCRIPTION.
Texas Water Development Board, Austin.

Available from NTIS as PB-194 092, $3.00 in paper copy, $0.65 in microfiche. Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol V - Stochastic Demand Prog Descrip, Aug 1969. 48 p, 3 fig, append. OWRR Project C-1377 (No 1975) (8).

Descriptors: *Stochastic processes, *Computer programs, *Irrigation design, Agriculture, Demand, Synthetic hydrology, Runoff, Texas, Management, Simulation, Optimization.

The construction of a stochastic technique for the generation of areawide demands was investigated and recommendations for implementation of a resultant computerized procedure were presented. The study, by Dr. G. K. Young of Water Resources Engineering, Inc. represented a first attempt to develop a procedure to generate stochastic agricultural demands for irrigational water on a unit acre basis for prespecified cropping patterns, soil conditions, irrigation efficiencies and effective rainfall assumptions. The soil moisture accounting technique used by the Texas Water Development Board served as a comprehensive source of information concerning irrigation computations and predictions. It was concluded that a specially tailored version of the technique be employed, in conjunction with stochastic hydrology and an artificial data generator to calculate synthetic demands. An additional conclusion was that runoff data should be incorporated into the stochastic generating process. Stochastic hydrology and irrigation prediction techniques were synthesized by a two-step procedure to calculate synthetic demands. The stochastic procedures were developed in conjunction with the simulation and optimization programs but no attempt was made to insure their direct compatability with each other. (See also W70-09511) (Kriss-Cornell)

A COMPLETION REPORT ON SYSTEMS SIMULATION FOR MANAGEMENT OF A TOTAL WATER RESOURCE - VOLUME VI - RESEARCH ACCOMPLISHMENT AND COST SUMMARY.
Texas Water Development Board, Austin.

Completion Report of the Texas Water Development Board and Water Resources Eng, Inc, Vol VI - Research Accomp and Cost Summary, Aug 1969. 11 p, 1 fig, 8 ref, 1 append. OWRR Project C-1377 (No 1975) (9).

Descriptors: *Computer programs, *Costs, *Research, Water Resources planning, Texas, Water management (Applied), Scheduling.

A computer-oriented planning system for use in the planning of large, multi-basin systems of reservoirs and connecting river reaches and pump-canals of the proposed Texas Water System was summarized. Nine interrelated computer programs and the approach for using these programs were developed. They were of five types: Data Management Programs, Simulation Programs, Stage Development Programs, Allocation Programs, and Stochastic Demand Programs. The purpose of all five types and their corresponding subdivisions were reviewed. A detailed project schedule was given where the first significant step was taken in June of 1967. 'Conceptual approaches' to the solution of the water development problems in Texas were submitted by seven firms. A 'Consulting Panel' was formed by the Board that defined the framework of the needed research and provided guidance to the research staff. A Systems Engineering Group was created to provide for developing an 'in-house' capability of using results of the first year's research and to conduct future studies and complete the computer-oriented planning system by 1972. The specifications of the research project proposed for the fiscal year 1970 were given along with the estimated expenditures, a list of research education and publication benefits, and the research staff. W70-09519

FINAL PROGRESS REPORT DELAWARE ESTUARY AND BAY WATER QUALITY SAMPLING AND MATHEMATICAL MODELING PROJECT.
Delaware River Basin Commission, Trenton, N.J.

Available from NTIS as PB-193 799, $3.00 in paper copy, $0.65 in microfiche. Delaware River Basin Commission, May 1970. 105 p, 10 tab, 27 fig, 10 ref. FWQA Project 16090 DCL...5/10.

Descriptors: *Mathematical models, *Dissolved oxygen, *Biochemical Oxygen Demand, *Pollution abatement, *Water quality, Water pollution, Oxygen sag, Organic wastes, Waste water treatment.
Identifiers: *Parameters of biochemical oxygen demand, Carbonaceous biochemical oxygen demand, Nitrogenous oxygen demand.

This is a report on a demonstration grant from the Federal Water Pollution Control Administration. The principal contents are comparisons of water quality parameters for the Delaware Estuary with those previously estimated for years ending 1963. Data on water quality were also obtained for a number of major pollution sources. Comparisons show that previous mathematical models for the Delaware Estuary can still be used to verify dissolved oxygen levels. Current levels of dissolved oxygen fail to meet the standards established by the Commission. It is stated that in the future, regulation of carbonaceous raw waste of industry and municipalities will be sufficient to meet these standards, but no basis for this prediction is outlined in the report. This report provides background for further analysis of economically feasible alternatives programs on the Delaware River. (Whipple-Rutgers)

A NOTE ON THE RELATION BETWEEN BINARY AND MULTIPE CHOICE PROBABILITIES,
Presidency College, Calcutta (India); and London School of Economics and Political Science (England).
S. K. Chakrabarti.
Econometrica, Vol 37, No 4, p 726-727, Oxtober 1969. 2 ref.

Descriptors: *Probability, Mathematical studies.
Identifiers: *Binary choice, Ranking.

At the end of his classic paper, 'Threshold in Choice and the Theory of Demand.' Nicholas Georgescu-Roegen raised a significant problem. Namely, 'What axioms are logically necessary and experimentally justified, to relate the multiple choice probability to that of the binary choice.' In this note a simple ranking postulate is proposed as a possible answer to this situation. This article may prove of interest to the researcher in the water area concerned with mathematical models making use of the theory of probability in the context of threshold variables. (Loeb-Rutgers)

STOCHASTIC STABILITY OF SHORT-RUN MARKET EQUILIBRIUM: COMMENT,
Rutgers - The State Univ., New Brunswick, N.J. Bureau of Conservation.
E. Roy Weintraub.
Quarterly Journal of Economics, Vol LXXXIV, No 1, p 161-167, February 1970.

Descriptors: *Stability, *Equilibrium, Prices, Supply, Risks.
Identifiers: *Stochastic stability, *Market equilibrium, *Shocks, Discrete time model, Linear stochastic model, Walrasian stability, Marshallian stability, Random shocks, Dynamic analysis.

Comments are made on a recent article by Stephen J Turnovsky in which random disturbances were introduced into a cobweb model and which showed that stochastic parameters were crucial for the analysis of stochastic stability. This note shows that the techniques of stochastic stability analysis used by Turnovsky in the case of discrete time systems can be carried over to continuous time to generalize the usual Marshallian and Walrasian stability conditions. A second purpose of this note is to present briefly some salient features of stochastic stability theory. This may prove helpful in analyzing equilibrium and stability in the water resources area where the problem is analyzed via a cobweb model or via simple multiplicative and additive continuous time stochastic systems that reflect risk or uncertainty in the water demand and supply functions. (Loeb-Rutgers)

EXTERNALITIES AND OUTPUT TAXES,
Washington Univ., Seattle.
Lowell R. Basset, and Thomas E. Borcherding.
The Southern Economic Journal, Vol 36, No 4, p 462-464, April 1970. 1 fig, 5 ref.

Descriptors: *Taxes, Supply.
Identifiers: *Externalities, *Output, Inferior input, Short-run, Long-run, Output tax.

It is demonstrated that under widely used assumptions a tax on output will always cause a long-run reduction in the amount of the externality supplied by the industry whether the input producing the externality is inferior or normal to the firm. Further, the authors extend the analysis of an output tax to a general model, namely an n-input, competitive-market model with imperfectly elastic factor supply functions facing the taxed industry. In this case comparative statics results are not necessarily determinate; however, this ambiguity does not arise because of the presence of an inferior factor but because of the general problem of complementarity. This analysis may prove applicable to the water area when analyzing the effect on the externalities created by a water related industry when a tax is imposed upon the output of that industry. (Loeb-Rutgers)

FIRST ORDER CERTAINTY EQUIVALENCE,
California Univ., Berkeley.
E. Malinvaud.
Econometrica, Vol 37, No 4, p 706-718, October 1969. 7 ref.

Descriptors: *Risks, Probability, Value, Decision making.
Identifiers: *Certainty equivalence, Decision, Quadratic payoff, Dynamic problem, Instruments, Payoff function, Strategy.

The classical certainty equivalence theorem states that the optimal decision in a risky situation is the same as in some associated riskless situation. It holds true under rather specific conditions; quadratic payoff, and linear relations between instruments and results. When these conditions are not met but the various functions involved are differentiable, an approximate property can still be stated. The property is proved and discussed for the following well known dynamic problem: when information accumulates over time how should one choose the sequence of values to be given to some instruments. This paper may prove helpful to the theoretical problems in decision making in the water area. (Loeb-Rutgers)

RIVER FLOW FORECASTING THROUGH CONCEPTUAL MODELS: PART 2 - THE BROSNA CATCHMENT AT FERBANE,
Institute of Hydrology, Wallingford (England).
P. E. O'Connell, J. E. Nash, and J. P. Farrell.
Journal of Hydrology, Vol 10, No 4, p 317-329, June 1970. 13 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, Computer programs, Rational formula, Simulation analysis, Model studies, Hydrographs, Hydrograph analysis, Precipitation (Atmospheric), Runoff forecasting, Routing, Hydrologic budget, Water balance, Parametric hydrology.
Identifiers: Brosna watershed (Ireland), Ferbane (Ireland).

An attempt to model the runoff process on the Brosna catchment is described. The Brosna catchment covers some 458 square miles in the center of Ireland and drains into the Shannon. The catchment is very flat except where some glacial deposits provide some relief. Two lakes cover 10 square miles at the upper end of the catchment. The underlying carboniferous limestone is covered by boulder clay which supports grazing land and some peat bogs with a little woodland. There is no noticeable evidence of substantial groundwater movement across the topographical boundary. The model accounts for 80-85% of the initial variance. Interdependence among the parameters must be avoided if the optimum values of the parameters are to be well defined. Much better results could be achieved by further elaboration of the model. ON LINEAR PROGRAMMING IN A MARKOV DECISION PROBLEM,
Yale Univ., New Haven, Conn.
Eric V. Denardo.
Management Science, Theory, Vol 16, No 5, Jan 1970, p 281-288, 8 p, 20 ref. NSF Grant GK-13757.

Descriptors: *Markov processes, *Linear programming, *Optimization, Decision making, Planning, Analytical techniques.
Identifiers: Iteration algorithm, Choice.

Numerous water resources models incorporate Markow processes. An undiscounted Markov decision model with an infinite planning horizon was described. The model was analyzed by application of a linear program first proposed by Manne for a special case of the model. A brief description and comparison of a single-chain policy iteration routine with a complex multichain policy iteration algorithm which computed an optimal policy was given. It was shown that Manne's single-chain linear program found the ergodic chain that optimized the gain rate over all chains, regardless of chain structure. This solves optimization problems in which the decision-maker has his choice of policy and of starting state. It was then shown how to embed the single-chain program in a decision procedure that finds a gain maximizing policy efficiently in all cases, simple or complex. A Markov renewal programming model was introduced with finite states or regeneration points. A program to generalize Manne's program to the Markov renewal model was used as the primary tool in a procedure described for computing a gain optimal policy. A second program was considered which was analogous to linear programming for discounted Markov decision problems. (Kriss-Cornell)

A FRACTILE APPROACH TO LINEAR PROGRAMMING UNDER RISK,
Iowa State Univ., Ames. Dept. of Economics.
J. K. Sengupta, and J. H. Portillo-Campbell.
Management Science, Theory, Vol 16, No 5, Jan 1970, p 298-308. 11 p, 7 tab, 15 ref. NSF Project GS-1810/420-21-17.

Descriptors: *Linear programming, *Risles, Theoretical analysis, Stochastic processes, Optimization, Variability, Probability, Profit.
Identifiers: Computational analysis, Empirical analysis, Fractile criterion.

The implications of a fractile approach to linear programming under risk through maximizing a given fractile of the distribution of profits under linear programming restrictions were examined both theoretically, computationally and empirically. In recent years the water resources linear programming models have increasingly incorporated concepts of risk and uncertainty through the various approaches of probabilistic programming; e.g., chance-constrained programming stochastic programming etc. An investigation of the implications of some of the simple methods of risk programming using three optimization criteria, e.g., expected value, the fractile and the portfolio criterion was given. In the expected value criterion

he expected profit level was maximized, whereas he portfolio criterion minimized (i.e. variability) of total profit subject to some minimum expected profit. The fractile criterion sought to maximize the alpha-fractile of the cumulative probability distribution of profits with the value of alpha preassigned by the decision maker. Advantages of the fractile criterion applied to linearprogramming problems under risk were illustrated and the approach was discussed under the assumption that he profit function was normally distributed. (Kriss-Cornell)

EXPERIMENTAL DESIGNS FOR COMPUTER SIMULATION EXPERIMENTS,
Princeton Univ., N. J.; and Duke Univ., Durham, N. C.
. S. Hunter, and T. H. Naylor.
Management Science: Theory, Vol 16, No 7, March 1970, p 422-434. 13 p, 1 fig, 2 tab, 31 ref. NSF Grant GS-1926.

Descriptors: *Simulation analysis, *Computer program, *Mathematical models, Design, Optimization, Analytical techniques.
Identifiers: Practical problems.

Within the context of two simulation experiments with an inventory model, the paper discussed factorial, franctional factorial, rotatable, and response surface designs. Careful attention to experimental design questions prior to conducting a simulation experiment was given. Experimental designs were available for: (1) investigating the relationship of the response to the factors in order to determine the underlying mechanisms governing the process under study and (2) finding the combination of factor levels at which the response variable is optimized. These designs were not only economical but provided a structure for the investigator's learning process. A full description of a simulation model was given and the following four activities were described: formulation of a computer program, validation, experimental design, and analysis of simulated data. An example model was used and two different types of simulation experiments were described - an explanatory model and an optimization model. A number of practical problems which arise in designing simulation experiments were described as the problem of sample size, the multiple response problem, the problem of nonlinearity, the problem of convergence, and the problem of constrained optimization has application to water resources simulation modeling. (Kriss-Cornell)

EFFECT OF THREE VOTING RULES ON RESOURCE ALLOCATION DECISIONS,
Pittsburgh Univ., Pa. Graduate School Business.
Jacob G. Birnberg, Louis R. Pondy, and C. Lee Davis.
Management Science: Application, Vol 16, No 6, Feb 1970, p B356-372. 17 p, 8 tab, 25 ref.

Descriptors: Resource allocation, Decision making, Budgeting, Capital, Laboratory tests, Model studies, Variability.
Identifiers: Voting rules.

The effect of the voting rule adopted by a capital budgeting committee on the allocation of resources among divisions was examined. The results of a laboratory experiment indicated that different voting rules have different characteristics measured in terms of the size of the total budget allocation made and the interdivision variability. In addition, an attempt was made to ascertain the techniques used by the groups to reach a decision. Four possible models were developed: the random choice model, the long run cooperative model, the short run competitive model, and the gaming model. None of the four models offered provided an adequate explanation of the observed behavior. However, a mixed model consisting of two of the approaches did provide a reasonable explanation for the observed behavior. (Kriss-Cornell)

A SIMULATION MODEL OF CAPITAL BUDGETING UNDER UNCERTAINTY,
Texas Univ., Austin.
Rodolfo Salazar, and Subrata K. Sen.
Management Science: Application, Vol 15, No 4. Dec 1968, p B161-B179. 19 p, 7 fig, 5 tab, 24 ref.

Descriptors: *Simulation analysis, Capital costs, *Budgeting, Investment, *Stochastic processes, *Linear programming, *Risks, Mathematical models, Management, Constraints.
Identifiers: Weingartner's Basic Horizon model.

A simulation model of capital budgeting under uncertainty is described. It analyzed the effects of two types of uncertainty which influence the cash flows of the potential investment projects. Techniques of simulation and stochastic linear programming (using Weingartner's Basic Horizon model of capital budgeting) were employed to compute the expected return (with an associated measure of the risk involved) of different portfolios of projects. The manager could then select the portfolio which was closest to his personal risk-return preference. The model provided a practical guide to management in the entire process of project search, portfolio generation, and portfolio evaluation which characterizes the capital budgeting decision. Several formal mathematical programming techniques recently proposed for handling uncertainty were mentioned: Stochastic linear programming, linear programming under uncertainty and chance-constrained programming. The approach taken in this paper utilized concepts of decision trees simulation, and stochastic linear programming. Has numerous applications to water resources capital budgeting problems. (Kriss-Cornell)

AN APPROACH TO LINEAR PROGRAMMING WITH 0-1 VARIABLES,
Keio Univ., Tokyo (Japan).
Shiyuo Senju, and Yoshiaki Toyoda.
Management Science: Application, Vol 15, No 4, Dec 1968, p B196-B207. 12 p, 7 fig, 6 tab, 2 ref, 1 append.

Descriptors: *Linear programming, *Variability, *Decision making, *Optimization, Mathematical models, Profit.
Identifiers: Integer programming.

Not infrequently water resource planning alternatives are presented as fixed; i.e., a project is to be built to its specified capacity or not at all. The article presented a simple approach to obtaining approximate solutions to decision making problems in which one seeks to choose the optimal package from a large number of indivisible independent proposals. The fundamental concept was to make some ordinal scales among proposals. Steps of calculation were illustrated by examples of choosing the optimal mix of orders, one of which involved 60 candidate proposals with 30 restricting conditions. The problem was formulated in mathematical terms and was a special case of the interger programming problem often called the 'Knapsack Problem'. A simple numerical example was used to illustrate the problem of choosing the optimal package of orders so as to maximize the total profit, with an order either fully accepted or not accepted with no in-between condition. A two-dimensional vector notation expressed the relations between proposed orders and limiting conditions. Improvements of the procedure and some generalizations were made. An example with four restricting conditions and a large scale example were also given. The advantages of the method were presented in the conclusion. (Kriss-Cornell)

MARKOV CHAINS AND EMBEDDED MARKOV CHAINS IN GEOLOGY,
Northwestern Univ., Evanston, Ill. Dept. of Geological Sciences.
William C. Krumbein, and Michael F. Dacey.
Report available from NTIS as AD-704 748, $3.00 in paper copy, $0.65 in microfiche. Northwestern University, Department of Geological Sciences Technical Report No 12, April 1970. 18 p, 42 ref. ONR Contract No NR 389-150 and 389-153.

Descriptors: *Hydrologic data, *Data processing, *Statistical methods, *Markov processes, Stochastic processes, Statistics, Mathematical studies, Simulation analysis, Synthetic hydrology, Geology, Hydrology, Data collections, Bibliographies, Reviews, Stratigraphy, Sedimentation.
Identifiers: Geological data.

Geological data are structured as first-order, discrete-state discrete-time Markov chains in two main ways. In one, observations are spaced equally in time or space to yield transition probability matrices with nonzero elements in the main diagonal; in the other, only state transitions are recorded, to yield matrices with diagonal elements exactly equal to zero. The mathematical differences in these two approaches are reviewed here, using stratigraphic data as an example. Simulations from chains with diagonal elements greater than zero always yield geometric distributions of lithologic unit thickness, and their use is recommended only if the input data have the same distribution. For thickness distributions lognormally or otherwise distributed, the embedded chain is preferable. The mathematical portions of this paper are well known, but are not readily available in publications normally used by geologists. One purpose of this paper is to provide an explicit treatment of the mathematical foundations on which applications of Markov processes in geology depend. (Knapp-USGS)

A DYNAMIC MODEL OF WATER QUALITY MANAGEMENT DECISION-MAKING SYSTEMATIC ANALYSIS OF THE MANAGEMENT EFFECTIVENESS OF THE WATER QUALITY CONTROL BOARD SYSTEM OF CALIFORNIA,
Engineering-Science, Inc., Oakland, Calif. Research and Development Lab.
Richard M. Males, William E. Gates, and Junius F. Walker.
Available from NTIS as PB-194 335, $3.00 in paper copy, $0.65 in microfiche. Engineering-Science, Research and Development, Final Report, May 1970. 44 p, 11 fig. OWRR Project C-1496 (no. 1989).

Descriptors: *Decision-making, *Behavior, *California, *Administrative decision, *Water quality control, *Simulation analysis, *Systems analysis, *Social change.
Identifiers: *Enviromental system dynamics, *Dynamics of social systems, *Industrial dynamics, *Behavioral science.

Techniques of behavioral science and systems analysis were utilized to analyze the internal decision-making structures of the Regional Water Quality Control Board of California. The Board was treated as a three-component entity which responds dynamically to information inputs from pressure groups. The decision-making process was taken as consisting of functional areas: (1) generation of pollution; (2) perceived level of actual pollution; (3) desired level of water quality; (4) desired rate of adjustment between existing and desired quality; (5) negotiation of response between interest groups. Based on the above framework, a computer simulation model of the decision-making process was developed. Data for the model were obtained from partially structured interviews and from case studies. The model is capable of characterizing behavior of the decision-making process as a function of a number of physical and behavioral

parameters. Informal, rather than formal objectives govern the operation of the Board. The regional board system of California is effective insofar as it can achieve cooperation on the part of those dischargers holding strong vested interests in the area. Long delays between problem identification and resolution are inherent in the system.

LAKE MICHIGAN BASIN STUDY: MICHIGAN SECTION.
League of Women Voters of Michigan, Detroit.

Available from the League of Women Voters of Michigan, 4612 Woodward Ave, Room 317, Detroit, Michigan, 48201. Price-30 cents. League of Women Voters of Michigan, Detroit, Michigan, January 1968. 36 p, 1 dwg, 17 ref, (Mimeographed).

Descriptors: *Lake Michigan, *Michigan, *Administrative agencies, *Hydrology, *Geology, *Water resources development, *Water supply, *Pollution abatement, *Flood control, *RIrrigation, *Navigation, *Watershed Protect. and Flood Prev. Act, *Recreation, *Fish, *Wildlife.
Identifiers: *Western Michigan Lake Shoreline, *Upper Peninsula-Eastern Area, *Lower Peninsula-Northwestern Area, Act 253.

The Michigan section of the Lake Michigan is described in terms of physical characteristics and water-related activities. Geological and hydrological conditions are reviewed including information regarding lake current, lake levels, water quality, tributary streams in Michigan and aquatic life. In 1960 there were more than 2.5 million people in this section of Lake Michigan. The economy of the basin is considered in three areas: Western Michigan Lake Shoreline, Upper Peninsula-Eastern Area, and Lower Peninsula-Northwestern Area. Agriculture, and to a lessening degree logging, have dominated the basin as a whole; the use of Lake Michigan water for irrigation has been of little significance. Water supply for approximately 650,000 comes from Lake Michigan. Principal sources of water supply are listed as are state and federal agencies with responsibilities in this connection; it is concluded that groundwater is being depleted faster than it is being replenished. A variety of pollution sources and efforts at abatement are reviewed. Included is discussion of sanitary disposal systems, industrial waste, large and small craft, and appropriations. Magnitude of flooding and projects and agencies dealing with it are listed; the same is done for irrigation. Power generation using hydroelectric coal-fired, and eventually nuclear steam generation systems is discussed with reference to its effect on water. Commercial navigation has been and will continue to be of great significance to the area; discussion of eight harbors is given. Watershed projects stemming from Act 253 and PL 566 are indicated. Finally listed are facilities and available resources for boating, camping, fishing and hunting. (Preckwinkle-Chicago)
W70-09622

LAKE MICHIGAN BASIN STUDY-ILLINOIS SECTION.
League of Women Voters, Detroit, Mich. Lake Michigan Inter League Group.

League of Women Voters, Chicago, 1968. 31 p. (Mimeographed)

Descriptors: *Lake Michigan, *Illinois, *Water resources development, *Water utilization, *Pollution abatement, *Administration, *Geology, *Flood control, *Recreation, *Navigation, *Irrigation, *Watershed management, Electric power.
Identifiers: *Chicago, Geography, Illinois Sanitary Water Board, Chicago Water Board, Metropolitan Sanitary District, Northeastern Illinois Planning Commission, North Shore Sanitary District, Lake diversion.

The Illinois section of the Lake Michigan basin is described with summaries of geological and geographical characteristics of the area. Efforts at pollution abatement, flood control, irrigation and water use in power generation and recreation are discussed, and finally outline of administrative organization, navigation, watershed management, and international and interstate commissions is made. The Chicago area's effect is emphasized because of its great population concentration and the problems which arise with regard to water supply, transportation, and waste disposal. Limitations on lake diversion serve as an example here. Indicated as especially important are the Sanitary Water Board, the Chicago Water Board and the Metropolitan Sanitary District along with an advisory agency, the Northeastern Illinois Planning Commission. A study of water supply needs published by this latter agency is reviewed with projections for each of the six counties included. Pollution abatement efforts directed toward the North Shore Sanitary District and industrial polluters are discussed as are the efforts of a number of federal and interstate agencies and state agencies. The magnitude of the flooding problem is discussed with reference especially to sewer overflow. With regard to recreation, federal agencies' responsibilities are summarized. Because of the numerous local, regional, and state agencies concerned with water resources development, an effort is also made to summarize their responsibilities. Navigation is reviewed in terms of facilities and pollution problems. Watershed management problems are indicated and practices and programs to deal with them mentioned. Finally described are five commissions dealing with interstate and international concerns. Preckwinkle-Chicago
W70-09623

LAKE MICHIGAN BASIN STUDY: WISCONSIN SECTION.
League of Women Voters, Detroit, Mich. Lake Michigan Inter-League Group.

League of Women Voters, Wisconsin, 1968. 10 p, 11 ref. (Mimeographed).

Descriptors: *Lake Michigan, Wisconsin, Geology, Population, Water resources development, Legislation, Water supply Pollution abatement, Flood control, Electric power, Irrigation, Navigation, Watershed management, Industrial wastes, Sewage treatment, Pulp wastes, Fishing, Wildlife.
Identifiers: *Northeastern Wisconsin, Southeastern Wisconsin, Milwaukee, Green Bay.

The Wisconsin section of the Lake Michigan basin is described with brief summaries of physical characteristics, population characteristics, economic characteristics and water related activities and characteristics. Included are descriptions of water supply, pollution abatement, flood control, power generation, irrigation, navigation, watershed management, recreation, fish and wildlife. Because of regional differences the northeastern and southeastern sections of Wisconsin are considered separately. The northeastern section centers around Green Bay. Population in this section is expected by 2020 to nearly double the 1960 level of 778,000. Principal occupations are listed and because of the importance of lumber the waste load from pulp and paper is an important contribution to pollution. The southeastern section has a population of 1,674,000 and with a 59.9 increase expected between 1963 and 1990 it is one of the nation's fastest growing large metropolitan regions. Six major and five minor watersheds are listed with groundwater as contributing to the water supply. In much of the region, flooding is a recurring problem and with continued urbanization this is expected to increase. Approximately 59 of urban developed area is served by facilities from Lake Michigan. Commercial shipping, confined to the Milwaukee Harbor area, is described as are recreational areas. State control of water resources brought about by 1966 legislation is discussed. Finally, the work of Southeastern Regional Planning is reviewed. Included is a statement from the agency pinpointing municipal sewage plants as the most important sources of pollution in the region. (Preckwinkle-Chicago)
W70-09624

LAKE MICHIGAN BASIN STUDY: INDIANA SECTION-1.
League of Women Voters, Detroit, Mich. Lake Michigan Inter-League Group.

League of Women Voters, Indiana, 1968. 9 p, 1 map, 5 ref. (Mimeographed).

Descriptors: *Lake Michigan, *Indiana, *Geology, *Population, *Water resources development, *Water supply, *Pollution abatement, *Electric power, Navigation, Administration, Watershed management, Recreation, Flood control, Irrigation, Industrial wastes, Sewage treatment.
Identifiers: *Lake Michigan basin, *St. Joseph river basin, Burns Ditch, Indiana Dunes.

The Indiana section of the Lake Michigan basin is described with summaries of physical characteristics, population, and economy. Groups active in water resources development are listed and discussion given to water supply, pollution problems, flooding, irrigation, power generation, navigation, watershed management, and recreation. In addition to the Lake Michigan basin, the St. Joseph river basin is included because of its indirect concern with the lake. The Lake Michigan basin is of glacial composition with northerly drainage and topographical conditions producing creeks and small rivers. A number of these are described along with Burns Ditch construction. Greatest population is in northern Lake County with Primary Metal Industries employing 61.9% of the regions industrial workers. Water supply is judged to be adequate for some time with open water of Lake Michigan of excellent quality. Industrial wastes, municipal sewage and combined sewer overflows are principal pollution sources; the quality of major lakes, harbors, and rivers in the region is reviewed. Flooding is of limited importance and irrigation even less. Steam generation and the possibility of nuclear energy are closely related to water as is navigation especially with large industry. Watershed and recreation plans are reviewed with the Indiana Dunes especially important. Although less dense, the St. Joseph River with 408,130 in 1960 was almost two thirds as populous as the Lake Michigan basin. With numerous lakes, rivers and water at shallow depths water supply is no problem. Plans, criteria and standards regarding sewage treatment are reviewed; analyses have indicated poor river conditions at times. Although there are several dams in the region, most power is from fossil fuel with steam generation. (Preckwinkle-Chicago)
W70-09625

POLITICAL AND SOCIAL ACCOMMODATION AS A BASIC ELEMENT IN PLANNING.
Colorado State Univ., Fort Collins.
Norman Wengert.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John A. Straayer, editor, Policy Science Paper No. 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 55-71. 1 ref.

Descriptors: *Planning, *Administration, Social values, Attitudes, Political aspects.
Identifiers: *Political accommodation, *Social accommodation, Goals, Policy.

The need to approach political and social accommodation from a new viewpoint is enphasized. The concept of accommodation in planning has typically been approached from a negative viewpoint; i.e., accommodation implied non-rational action. Accommodation is seen in terms of flexibility of planning, the recognition of wider interests and views, and innovative planning. Planning can be thought of representing a kind of rationality in relating ends (a complex goal and value structure) to means, with the stress upon instrumental rationality and not on absolute sets of principles or conclusions. Motivation is also discussed as a factor stressing the need for accommodation in planning. Motives for executing a particular public program tend to be quite heterogeneous, a fact often overlooked by officials deeply involved in programs, who tend to think of public support as being unitary and with a single motive. A final consideration is the need to relate planning in the theoretical and conceptual sense to the realities of the democratic system. Problems such as different community goals in different social groups, disenfrancisement of minority groups, and lack of public institutions formulate and articulate public goals. (See also W70-09627). (Davis-Chicago)

COMPREHENSIVE WATER RESOURCE PLANNING: THE NEW APPROACH.
North Carolina Univ., Chapel Hill.
Maynard M. Hufschmidt.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No. 1, Department of political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 97-113.

Descriptors: *Planning, *Water resources, *Methodology, River basin development, Economic efficiency, Urbanization, Inter-agency cooperation.
Identifiers: *Comprehensive water resource planning, Economic development, Political equity, Environmental quality, Multi-sector planning.

Six major points regarding the status of comprehensive water resource planning are made. First, the present pattern of comprehensive river basin planning is not obsolete in many important respects. Second, the historical preoccupation with economic development as a rationale for water resource undertakings is much less important today than it once was. Third, in terms of plan formulation and analysis, the past concern for ecenomic efficiency as the single most important objective is being displaced by a concern for a broader set of objectives, e.g., equity and environmental quality. Fourth, the scale, scope, and content of water resource planning activities today are to some extent inadequate and obsolete, failing to deal with urban-metropolitan and urbanizing areas. Fifth, water resource planning must increasingly be carried out in a context of multi-sector planning. Sixth, water resource agencies must develop new patterns of working relationships with state and local agencies and with other federal agencies and programs. (See also W70-09629). (Davis-Chicago)

WATER RESOURCES PLANNING IN A METROPOLITAN NATION.
Georgia Inst. of Tech., Atlanta.
Guy J. Kelnhofer.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No. 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 185-190.

Descriptors: Urbanization, *Planning, Cities, Decision making, Political aspects, Water quality, Aesthetics, Institutions, Institutional constraints.
Identifiers: *Metropolitan water resource management, *Water resource planning, Metropolitan areas.

The United States has become an urban nation. As a result, the traditional governmental machinery and the set of assumptions and values which underlie it may not be applicable to the conditions of life in the modern metropolis. As a result, many new demands are being made upon water resources planning. First, a new measure of public investment decisions is how it affects people; and in what people can participate in the decision-making process. Second, urban interests rather than rural interests are the focus for water resources planning. Third, new considerations of water use are rising to prominence, considerations of quality and aesthetics. Fourth, change, flexibility, and responsiveness have become critical criteria in the public's evaluation of its management systems. Finally, agencies, such as the Corps of Engineers, will have to develop the ability to meet change confidently. To achieve this adaptability it is necessary to develop a highly-sensitive and smoothly-functioning internal planning capability. (See also W70-09630). (Davis-Chicago)

CHALLENGES OF THE URBAN METROPOLITAN ENVIRONMENT TO THE WATER RESOURCES PLANNER.
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheaffer.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No. 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 191-201. 13 ref.

Descriptors: *Planning, *Water resources, *Urbanization, Cities, Education, Multiple purpose, Research and development.
Identifiers: *Metropolitan water resource management, Urban environment, Regional integration, Comprehensive planning, Chicago, Muskegon County, Michigan, Little Calumet River.

Three basic concepts are discussed in attempting to provide a basis for this discussion of metropolitan water resource management. First, metropolitan areas are defined as sociological units embracing the central city and the surrounding urban sprawl. Second, the potential roles of water resource planners are described. A planner's role is a multiple one: he can be an educator and provide technical assistance; he can be a catalyst, and imaginatively trigger programs and developments, some of which are usually thought of to be unrelated to water resource management; and he can be the manager, taking sole responsibility for managing water with very little influence from anyone else. Third, metropolitan water resource management is described by a set of characterizing concepts: public-private involvement, multi-purpose planning, multiple means programs, research to keep abreast of technological and social change, techniques of regional integration, and the incorporation of water resources planning into comprehensive planning. Three case studies are used to illustrate how water planning can be related to the urban picture: the Chicago deep tunnel project, the Little Calumet Basin, the Muskegon County, Michigan waste water plan. PROBING THE RELATIONSHIPS BETWEEN THE CHARACTERISTICS OF SOCIAL AND PHYSICAL SYSTEMS,
Colorado State Univ., Fort Collins.
Duane W. Hill, and Charles L. Garrison.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 219-234. 1 ref.

Descriptors: *Methodology, Social needs, Social aspects.
Identifiers: *Interdisciplinary studies, Social system, Physical system.

Attention is focused on a search for ways of obtaining better quality information which can be used to generate more adequate answers to pressing questions. A basic difficulty has been the isolation of the various physical science and social science disciplines from each other. Consequences which changes in the physical system may have for the social system, and vice-versa, remain largely outside the purview of scientific investigation. The state of the interdisciplinary art is discussed emphasizing the interdisciplinary needs of social science. Several characteristics of social investigators are analyzed including: non-technical and non-scientific character, non-systematic and impressionistic techniques, non-functional descriptive orientations, low interest and low skills in sophisticated data collection, and progress toward scientific development. The interdisciplinary researcher will find that the descriptive yields of the social analysts are the most plentiful and ready for use. He will also find that a solid basis for experimental investigation has been laid, and if that basis is developed thoughtfully and carefully, it will yield a highly useful body of information. COMMUNITY EDUCATION FOR PARTICIPATION IN WATER RESOURCE PLANNING,
San Mateo Coll., Calif.
J. William Wenrich.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 235-246. 3 ref.

Descriptors: *Planning, *Education, *Water resources, *Decision making, Communication, Social values.
Identifiers: *Water resource planning, *Citizen participation, Susquehanna River Basin Project, Public hearing procedure.

A basic problem in water resource planning is the meaningful involvement of local interests in the planning process and decision making regarding planning. The problem is complicated by the increasing technical complexity of the decisions to be made. Also, ther is often a failure to distinguish effectively between technical decisions and value judgments. Existing techniques, notably the public hearing procedure, have failed in many instances to develop meaningful public participation in the planning of water resource development. Meaningful citizen participation in water resource planning decisions depends on establishing more effective means for two-way communication between water resource agencies and the public during the planning process. Research in this direction is described utilizing the Susquehanna River Basin Project as a case study. (See also W70-09633) (Davis-Chicago)

THE IRON LAW OF ENVIRONMENTAL DISORDER: A PESSIMISTIC NOTE ON COMPREHENSIVE PLANNING,
Colorado State Univ., Fort Collins.
John A. Straayer.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 247-255. 7 ref.

Descriptors: *Planning, *Decision making, *Environment, *Methodology, Political aspects, Social aspects.
Identifiers: *Comprehensive planning, Environmental disorder, Environmental problems.

Comprehensive environmental planning has to do with devising methods and arrangements for controlling large portions of the environment. Given this definition, it is argued that comprehensive environmental planning is impossible. Emphasis should be placed on various levels of short term, lo-

calized and incremental muddling. There is an 'Iron Law' affecting decision making in the American political system which precludes effective solution of large scale environmental problems. Four interacting factors underlie this theory of environmental disorder: (1) the existence of multiple decision centers in the American political system; (2) the nature of contemporary environmental problems; (3) the nature of decision making in situations where demands outstrip resources; and (4) an ideology which supports local and decentralized decision-making prerogatives. As long asthese factors continue to exist, decisions which preclude comprehensive environmental planning will continue to be made. (See also W70-09626) (Davis-Chicago)

THREE APPROACHES TO ENVIRONMENTAL RESOURCE ANALYSIS,
Harvard Univ., Cambridge. Landscape Architecture Research Office.
Raymond K. Belknap, and John G. Furtado.
Available from the Conservation Foundation, Washington, D.C., 20036, Price: $2.00. Washington, D.C., Conservation Foundation, November 1967. 102 p, 21 fig, 43 ref.

Descriptors: *Planning, *Land management, *Land resources, *Land management, *Optimum development plans, Ecology, Multiple-purpose projects, Natural resources, Resource development.
Identifiers: Environment resource analysis.

This study selected three outstanding approaches developed to identify, analyze, and evaluate the natural and man-made resources that make up the physical environment and to outline their procedures. The three approaches examined are those expounded by G. Anous Hills, Philip H. Lewis, and Ian L. McHarg. More particularly, the study examined: (1) How the three individuals identified environmental and spatial patterns beyond single-factor analysis and simple spatial location; (2) how they identified and evaluated the key elements and forces that lend quality to the physical environment; (3) how they reviewed the analysis material for incorporation into the planning process; and (4) whether they treated environment as a resource per se or only in terms of the given planning purposes. (Davis-Chicago)

WATER PROBLEMS,
Geological Survey, Menlo Park, Calif.
H. E. Thomas.
Water Resources Research, Vol 1, No 3, p 435-445, Third Quarter 1965. 11 p, 2 tab, 14 ref.

Descriptors: *Water resources, Legal aspects, Political aspects, Technology, Environment, Constraints, Storage, Flow, Attitudes, Benefits, Costs, Management.
Identifiers: *Water problems, Physical constraints, Cultural constraints, Customs, Technological constraints, Socioeconomic problems, Economic constraints.

Man's effort to adapt to or modify his environment has generated water problems. As a first approximation the author classifies the constraints that cause these problems as follows: (1) Physical constraints, caused by the environment, specifically as it affects the storage and flow of water; (2) cultural constraints, resulting from customs and mores; (3) technological constraints, resulting from man's varying ability to modify his environment; (4) economic constraints, resulting from comparison of the benefits that may be received from water with the cost of realizing these benefits. Economic constraints become significant where there is choice among several alternatives of action. For example, choices must be made by administrators and consumers of water supplies as water becomes a scarce commodity in places where it had been previously abundant. Economic constraints may dictate the allocation of funds and other resources to water development. (Loeb-Rutgers)

THE THERMO-ECONOMICS OF SEA-WATER CONVERSION,
California Univ., Los Angeles.
Myron Tribus, and Robert Evans.
Water Resources Center Contribution No 61, Rept 62-53, 1963. 241 p, 44 fig, 21 tab, 32 ref, 8 append.

Descriptors: *Costs, *Fresh water, *Sea water, Technology, Flash distillation, Thermodynamics, Velocity, Conductors, Heat, Condensers, Vapor compression distillation, Freezing, Electrodialysis, Reverse osmosis, Equipment.
Identifiers: *Sea-water-conversion, *Optimum energy-technique, *Thermo-economics, Cost equation, Basic unit costs, Primary unit costs, Brine recycling, Load factor, Nonlinear systems, Conductance, Information theory, Multi-effect distillation, Solar energy, Available energy costs, Equipment costs, Expected value.

In this report, the economic and technological aspects of saline-water demineralization are set forth in concise form as they appear in the light of an intensive study of the underlying principles of thermodynamics and economics. These principles are digested into a compact technique which the authors call the 'optimum-energy-technique.' The optimum-energy-technique promises to be a faster, simpler, and surer method of studying and optimizing sea-water-conversion systems relative to other methods in current use. Application of the optimum-energy technique are given in this report for the following saline-water demineralization processes: multistage flash distillation, multi-effect distillation, vapor compression distillation, freezing, electro-dialysis, reverse osmosis, solar energy, and low-temperature-difference distillation. The optimum-energy-technique shows the relative importance of the many technological factors of sea-water conversion primarily according to their effects on two critical unit costs; the costs of available-energy and equipment, and the equipment conductance cost. The expected value of the latter cost may be used for judging the merits of various research proposals. The optimum-energy-technique should, via illuminating the combined economic and technological aspects of sea-water conversion, prove to be useful for planning or appraising systems of sea-water rectification. NEW DIMENSIONS FOR TRANSNATIONAL MARINE RESOURCES,
Resources For the Future, Inc., Washington, D.C.
Francis T. Christy.
American Economic Review Vol LX, No 2, p 109-113, May 1970.

Descriptors: *Oceans, *Water resources, *Management, *Economic aspects, Continental shelf, Ocean circulation, Sea water, Water law, Fishing, Mining, Capital, Labor, Costs, Prices, Economic feasibility, Fisheries, Conservation, Economic impact.
Identifiers: *Exclusive rights, *property rights, Economic systems.

The author feels that the growing value of marine resources and the increasing incentive of nations to appropriate these resources makes the oceans a potential source of major conflict between states. Social scientists have an important role to play in the formulation of new rules and institutions governing the appropriation of the sea's resources. The paper studies the differences between resources of land and those of the sea. It is impossible to assign exclusive rights to the sea or to control the amounts of capital and labor applied to the resource. In the exploitation of the sea's resources there is a confrontation between economic units operating under different wage/price structures and different value systems. The difficulty of managing the sea's resources is explained as well as the problems posed by the occurrences of the resources in three dimensional space. The paper concludes with a statement stressing the urgency of an early solution to these problems. (Murphy-Rutgers)

INTRODUCTION TO THE ECONOMY AND CHARACTER OF THE WABASH BASIN,
Iowa Univ., Iowa City.
Ronald R. Boyce.
In: Regional Development and the Wabash Basin, p 9-45, University of Illinois Press, Urbana, 1964. 15 fig, 11 tab.

Descriptors: *Water resources, *Flood damage, Economics, Industries, Population, Employment, Water quality, Water utilization, Demand, Navigation, Recreation, Benefits, Costs.
Identifiers: *Wabash Basin, Urban activities, Traffic density, Water problems, Flood prevention.

This paper discusses general problems in the Wabash Basin, population characteristics, basic urban activities, and water resources. The discussion of the water resources of the Basin would be of interest to the water researcher in this area as well as other areas of the US. The author presents possible development plans for the area in addition to the navigational and recreation use of the water. Recreation appears to be a major water resource benefit which would be drived from water impoundments in the Wabash Basin. Flooding is a major water problem and presents a major reason for water resources development. However, the values of the many possible benefits from a water impoundment can only be determined by an investigation of potential water benefits and concomitant costs. Flood prevention measures and a discussion of future study needs conclude this paper. (See also W70-09657) (Loeb-Rutgers)
W70-09656

INDUSTRY AND WABASH BASIN DEVELOPMENT,
Illinois Univ., Urbana.
Howard G. Roepke.
In: Regional Development and the Wabash Basin, p 59-78, University of Illinois Press, Urbana, 1964. 11 fig, 1 tab.

Descriptors: *Industries, Economics, Maps, Employment.
Identifiers: *Wabash Basin, *Development, Economic growth, Manufacturing, Industrial development.

This paper presents a consideration of the role of manufacturing in the economy of the Wabash Basin. Industry is one of the leading means of support for the Basin, and it is likely that much of the opportunity for future economic growth lies in this field. The analysis in this paper takes two forms. First, largely by the use of maps, the present extent, distribution, types, and growth of industry in the Basin is examined. This illustrates the extent to which industrial development has already taken place. Second, as the Basin is not a completely self-contained unit, certain trends affecting manufacturing in the United States as a whole and their possible effect on further development in the Wabash Basin are presented. This information might be relevant to other river basins where multi-level economic development plans are under investigation. (See also W70-09658) (Loeb-Rutgers)
W70-09657

RECREATION AND WABASH BASIN DEVELOPMENT,
Illinois Univ., Urbana.
Alfred W. Booth.
In: Regional Development and the Wabash Basin, p 79-88, University of Illinois Press, Urbana, 1964. 1 fig, 1 tab.

Descriptors: *Recreation, Recreation demand, Regions, Demand, Planning, Recreation facilities.
Identifiers: *Wabash Basin, Regional development, Recreation development.

Modern programs of regional development, particularly those which are water-oriented, are giving increasing attention to outdoor recreation. This is a response to a demand created by a mobile, wealthy society, with much free time, which has come to regard opportunities for outdoor recreation as a necessary ingredient in a 'better way of life.' Thus, any area or regional development program today must plan to satisfy this need. Furthermore, if the region has the potential, the planning program should also include provisions for capitalizing on these assets by planning for recreation-centered economic activity. The Wabash Basin is in the category of regions in which there is not only a strong demand for recreation activity, but in which there is also a potential for recreational development which could satisfy regional needs as well as forming the basis for, at least, a modest recreational industry serving an extraregional market. SOME OBSERVATIONS ON THE BUDGET CONCEPT,
National Planning Association, Washington, D.C.
Gerhard Colm, and Peter Wagner.
Review of Economics and Statistics Vol 65, No 2, p 122-126, May 1963.

Descriptors: *Budgets, *Economic evaluation, *Decisionmaking, Government, Financing, Forecasting, Planning, Debt, Management, Costs, Benefits, Capital costs.
Identifiers: *Program analysis, *Financial analysis, *Program Budget, Capital Budget.

Various budget concepts are analyzed in the light of the different purposes a budget must serve. The National Budget in particular is dealt with but relevancy exists for the water resources area because observations on the different types of budgets needed for different purposes are applicable to any program subject to rigorous analysis. The author distinguishes three purposes of a budget; program analysis, financial analysis and economic analysis. For these purposes there is a need for a program budget, a statement of cash receipts and payments, and a national economic budget. The first type of budget is of most importance in water resources and the author discusses those characteristics of this budget that would increase the quality of decision making and provide a more efficient allocation of resources. (Murphy-Rutgers)

ON DIFFERENT METHODS FOR ALLOCATING RESOURCES,
Yale Univ., New Haven, Conn.
Martin Shubik.
Kyklos Vol XXIII, Fasc 2, p 332-337, 1970.

Descriptors: *Prices, *Resources, *Economic evaluation, *Distribution, Government, Economic efficiency, Resource development, Taxes, Costs, Resource allocation, Administration, Economic justification.
Identifiers: *Public goods, *Voting, *Market mechanism, *Externalities.

Price theory deals with the use of a price mechanism in solving the production and allocation of resources among a population. However, society must deal with the production and distribution of the product of jointly owned scarce resources within a society. For this purpose the price mechanism alone has been found to be deficient. This situation is faced by water resources as a public good. The author discusses eight different mechanisms which may be used for the allocation of resources: (1) The economic market with a price system. (2) Voting procedures. (3) Bidding. (4) Bargaining. (5) Allocation by higher authority, fiat or dictatorship. (6) Allocation by force, fraud or deceit. (7) Allocation by custom, including gifts and inheritance. (8) Allocation by chance. The analysis concludes that the problems of large-system implementation and of external economies and diseconomies point away from a larger functioning of the price system. The conclusion of this article is of general interest to theoretical research in the public good nature of water projects. (Murphy-Rutgers)
W70-09664

MICRODATA, ECONOMIC RESEARCH, AND THE PRODUCTION OF ECONOMIC KNOWLEDGE,
National Bureau of Economic Research, New York.
F. Thomas Juster.
American Economic Review Vol LX, No 2, p 138-148, May 1970.

Descriptors: *Optimization, *Research and development, *Economics, *Data collections, Statistics, Pollution, Cost, Government, Measurement, Income, Forecasting, Resource allocation, Social aspects.
Identifiers: *Microdata, *Economic research, Research design, Private returns.

An attempt is made to show that the generation of precise sets of micro-observations growing out of the analytical requirements of a specific research problem is likely to provide a much more promising method of expanding economic knowledge than the application of more sophisticated, analytical and statistical techniques to existing data. The author demonstrates the gap which exists between private and social returns to alternative research strategies which prohibits normal market forces from bringing about the necessary reallocation of research resources. The budgetary implications of the research strategy outlined are shown to be formidible with the most significant returns from that strategy not appearing for many years. The large amount of economic research being conducted in the water resource area could be aided by the application of the principles described in the article. (Murphy-Rutgers)
W70-09665

WATER-SUPPLY STRINGENCIES-FEATURES, ANTECEDENTS AND OBSTACLES TO RESOLUTION,
Geological Survey, Carmel, Calif.
Arthur M. Piper.
Boston College Industrial and Commercial Law Review, Vol 9, No 3, p 633-646, Spring 1968. 14 p, 34 ref.

Descriptors: *Water supply, *Water resources development, *Water law, Institutions, Governments, Legislation, Social aspects, Legal aspects, Economics, Water quality, Water yield, Water costs, Water shortage, Planning.
Identifiers: Water resources law.

It can generally be stated that present practices of water-supply management involve acquired habits some of which run counter to the realities of hydrology. These habits all too often take the form of policies and decisions which look towards selected effects rather than comprehensive objectives. Specifically, a resolution of foreseeable stringencies of supply must contend with illogical concepts for allocating available supplies among uses both present and prospective with circumscribed and, in many instances, inadequate institutional concepts, and with inflexible water law. It can thus be said that any success in resolving foreseeable stringencies at a still relatively early time--and thus precluding a later generation of more complex stringencies--may be measured in terms of breaks from traditional concepts and procedures. Solutions both bold in scale and novel in purpose are required. (Knapp-USGS)

INPUT-OUTPUT ANALYSIS OF WATER USE FOR NEBRASKA INDUSTRIES,
Nebraska Univ., Lincoln. Water Resources Research Inst.
A. W. Epp, and Maurice Baker.
Available from NTIS as PB-193 798, $3.00 in paper copy, $0.65 in microfiche. Technical Research Project Completion Report, August 1970. 15 p, 5 ref.

Descriptors: *Costs, *Irrigation, *Benefits, Nebraska, Analysis, Water rates.
Identifiers: Water productivity, Industry location.

The input-output analysis indicated that water was of minor importance to industry in deciding where to locate. Site selection by industry is based upon more important factors than water costs. A doubling of water costs for five heavy water using industries would increase cost of products less than one percent. Water costs in the meat packing and dairy processing industries were of minor importance. Those plants which purchased water from municipal water systems generally realized a greater productivity from water than those who had their own wells. The net benefits from irrigation with limited quantities of water were greatest when 21,000 acres were irrigated with direct stream diversion. Other alternatives considered were 21,000 acres with storage, 10,500 acres direct diversion. The net benefits ranged from minus (-) $128,000 for the 10,500 acres with storage to $284,000 for the 21,000 acres with direct diversion. The cost-supply study included three areas representing direc diversion, on-stream storage and off-stream storage types of projects. Nearly 65 percent of the water in the on-stream storage system was delivered to the farm while the other two

systems delivered only 52 to 53 percent of the water diverted. The cost per acre-foot of water supplied was $15.54, $20.33, and $22.58 for the direct diversion, off-stream storage and on-stream storage respectively. The on-stream storage system was able to deliver 0.072 acre-feet per dollar cost while the other two delivered 0.055 and 0.060 acre-feet per dollar cost for the off-stream storage and direct diversion respectively.

SOME ANALYTICAL RESULTS ON TAX DEPRECIATION,
American Telephone and Telegraph Co., New York.
Peter B. Linhart.
Bell Journal of Economics and Management Science Science Vol 1, No 1, p 82-112 Spring 1970.

Descriptors: *Depreciation, *Public utilities, *Government, *Economic evaluation, Mathematical studies, Taxes, Capital, Model studies, Debt, Rate of interest, Planning, Forecasting, Rate of discount, Costs.
Identifiers: *Accelerated tax depreciation, *Utility regulation, Firm growth rate, Flowthrough, Normalization, Rate of return.

This paper is an attempt to shed some light on the debate concerning the conflict between regulatory bodies and those utilities that would like to use accelerated tax depreciation as a source of working capital through normalization. It provides an analytical framework within which the effects of various depreciation policies on utilities, their customers and the Federal Treasury can be examined with some precision and generality. The main emphasis is on regulated utilities and the author shows that following a switch from straight-line book and tax depreciation to accelerated tax depreciation, with flowthrough, very substantial rate increases will always be required after a fixed interval, regardless of the firm's growth rate. Since most water utilities are of the regulated type described in the paper, the author's conclusions should be of interest to the water utility manager. (Murphy-Rutgers)

6D. Water Demand

INDUSTRIAL USE AND COMMUNITY SUPPLIES OF WATER IN ALABAMA,
Auburn Univ., Ala. Water Resources Research Inst
Donald R. Street, Robert R. Criss, Robert L. Burks, and James H. Baker.
Available from NTIS as PB-193 796, $3.00 in paper copy, $0.65 in microfiche. School of Business, Research Series I, January 1970. 111 p, 55 ref, 6 append. OWRR ProjectB-012-ALA (1).

Descriptors: *Water use, Industrial water, Water supply, Water allocation (Policy), Domestic use.
Identifiers: *Alabama, Alabama Water Improvement Commission.

This report identifies present and potential areas of conflict between water users in the State of Alabama. Even though at the present time there is an adequate supply of water for most industrial as well as community uses, the authors foresee major conflicts in the near future. They came to this conclusion after detailed study of water usage data collected from major industrial water users and from municipalities of over 100 persons in Alabama. Since Alabama has no comprehensive water resources usage law the authors urge the state legislature to evaluate water usage data and to formulate legislation which would lead to a more rational distribution and conservation of Alabama's water resources. CITY OF NEWARK V DEP'T OF HEALTH (ADMINISTRATIVE DETERMINATION OF WATER POTABILITY).

109 N J Super 116, 262 A2d 718-725 (1970).

Descriptors: *New Jersey, *Standards, *Water quality control, *Administrative decisions, Regulation, Public health, Judicial decisions, Legal aspects, Legislation, Local governments, Political aspects, Public benefits, Public rights, Social aspects, State governments, Potable water, Water purification, Water quality, Water pollution, Turbidity, Reservoir storage, Water treatment, Water supply, Flocculation, Administrative agencies.

Defendant Department of Health ordered plaintiff city and nearby municipalities to build a water treatment facility which would elevate the purity of their mutual water supply to defendant's minimum standards. Plaintiff brought action for a declaratory judgement, contending that such standards exceeded the authority delegated to defendant by the legislature in that the legislature had conferred upon defendant authority to determine only standards of water potability. Plaintiff argued that such authority did not include the determination of requirements as to purity of color, degree of turbidity and the like. The court held that the statutory language of the legislature indicated a broad delegation of powers to defendant in the area of public health, including the specific authority to regulate the purity of potable water and to enforce such regulation by administrative order. Furthermore, when dealing with statutes that promote public health, courts traditionally apply a liberal construction regarding supervisory and regulatory powers. The only test is whether such acts are reasonably related to the ends sought. The court held that defendant's standards of purity easily met that test. (Clarke-Florida)

LAKE FRONT EAST 55TH ST CO V CITY OF CLEVELAND (SUBSEQUENT GRADUAL ACCRETIONS AS NOT AFFECTING BOUNDARIES DETERMINED UNDER TORRENS ACT).
36 NE2d 196-197 (Ohio Ct App 1961).

Descriptors: *Ohio, *Accretion (Legal aspects), *Boundaries (Property), *Shores, Real property, Land, Land forming, Judicial decisions, Remedies, Boundary disputes, Regulation, Standards, Movement, Fluctuation, Legal aspects, Cities, Local governments, Relative rights.
Identifiers: *Torrens Act.

Plaintiff corporation had previously initiated an action under the Torrens Act, seeking and receiving a decree in which the location, direction and approximate length of the shore line to his property was determined. In later years the shore line was advanced by gradual accretions. Plaintiff brought this action to acquire title to the accretive land, as well as to obtain a change of his boundaries. In a per curiam opinion, the court held that plaintiff's rights were limited to the lands within the boundary lines established by the Torrenization proceedings. The court stated that the established rule of law required that once boundaries had been determined under the Torrens Act, such boundary lines did not change and were not affected by subsequent events. (Finman-Florida)
W70-09547

DOWNES V CROSBY CHEMICALS, INC (PUBLIC RIGHT OF ACCESS UPON NON-NAVIGABLE CREEK).

234 So 2d 916-922 (Miss 1970).

Descriptors: *Mississippi, *Non-navigable waters, *Ownership of beds, *Public rights, Navigation, Streams, Riparian rights, Streambeds, Navigable waters, Banks, Judicial decisions, Beds under water, Relative rights, Access routes, Legal aspects, Boating, Usufructuary right, Legislation, Remedies, Bodies of water.

In an action to quiet title and enjoin a trespass, plaintiffs contended that defendants had no right to enter upon a creek, the bed of which was owned by plaintiffs. Defendants asserted that they, as members of the general public, had a right to enter the creek with boats. The court held that the general public has a right to enter upon public streams regardless of who owns the bed of such streams. However, a public stream is one which is navigable as defined by statute or one which is navigable in fact. No statute was here applicable and the evidence showed that the creek was a small stream with relatively little water and with numerous obstacles, drifts, and jams. The stream was not navigable in fact nor by statute and, as such, was not a public stream upon the general public had a right to enter. The decree permanently enjoining defendants from further trespass upon plaintiffs' creek was affirmed. (Snow-Fla)
W70-09553

BOSTON EDISON CO V GREAT LAKES DREDGE AND DOCK CO (DAMAGES FROM DREDGING OF NAVIGABLE RIVERS).
423 F2d 891-897 (1st Cir 1970).

Descriptors: *Dredging, *Navigable rivers, *United States, *Transmission lines, River beds, Powerline carriers, Channel improvement, Stream improvement, Rivers, Beds under water, Underground, Legal aspects, Remedies, Judicial decisions, Federal government, Projects, Communication, Electrical networks, Administrative agencies, Damages.

Plaintiff brought an action against the United States and its dredging contractor for damages to plaintiff's power cables under a navigable river. Plaintiff contended that defendants were negligent in conducting dredging operations. Plaintiff's cables had been installed under the river pursuant to a permit issued by the Secretary of the Army, who had been authorized by Congress to make regulations for the use of the navigable waters of the United States. The government contended that a provision of plaintiff's permit exculpated the government from liability for damages caused by operations of the government in improving navigation. Plaintiff argued that, in light of the enunciation of governmental policy in the waiver of sovereign immunity by the Federal Tort Claims Act, the insertion of such provision was beyond the power validly delegated to the Secretary. The court held that governmental immunity still existed as to discretionary acts and that the Secretary's decision to dredge was such a discretionary act. Thus, the disclaimer of liability by the Secretary did not contradict any governmental policy and was not in excess of his delegation to make regulations. The exculpatory provision being valid, the summary judgment dismissing plaintiff's claim against the government was affirmed. (Snow-Fla)
W70-09555

GARDEN CONSTRUCTION CO V UNITED STATES (ACTION FOR THE WRONGFUL TAKING OF PROPERTY WITHOUT COMPENSATION).
423 F2d 273-277 (Ct Cl 1970).

Descriptors: *United States, *Drainage, *Easements, *Eminent domain, Pipes, Judicial decisions, Legal aspects, Cities, Federal government, Local governments, Streams, Diversion, Roads, Road construction, Surface drainage, Drainage practices,

ainage systems, Drainage effects, Damages, ater management (Applied), Surface runoff, ains, Ditches.

fendant United States installed a drainage pipe its property which, pursuant to an approved n, discharged water into a county roadbed utting its land. Since the stream was eliminated m use, plaintiff, to provide drainage to the coun- pursuant to its obligations in the creation of an ustrial park, was required to grant the county an sement across other parts of its land and to lay peline to drain off water in the roadbed which d accumulated after being discharged from de- ndant's property. Plaintiff contended that defen- nt's acts which caused the water to accumulate d which required plaintiff to grant an easement d lay pipelines, amounted to a taking of its pro- rty without compensation. The court held that ce there was no direct invasion of plaintiff's land drainage water, since defendant was duly per- tted to empty water into the roadbed, and since ch water was carried away by pipes and a ainage easement which was compelled by the unty and not defendant, it could not be con- ded that plaintiff's costs and damages resulted m a taking by defendant of plaintiff's property. arnett-Fla)

RISH OF JEFFERSON V UNIVERSAL EETING CO (RIPARIAN RIGHT TO USE OF NKS OF NAVIGABLE STREAM).
4 So 2d 88-93 (La Ct App 1970).

escriptors: *Louisiana, *Beds, *Banks, *Naviga- e rivers, Mississippi River, Regulation, Judicial cisions, Legal aspects, Levees, Riparian land, parian rights, Cities, Boats, Reasonable use, ores, Overflow, Public rights, Streams, Legisla- n, Administration, Usufructuary right, Zoning.
entifiers: *Batture land.

aintiff parish passed an ordinance zoning certain tture land for single-family residence. Defendant ased land on the batture for the purpose of moor- g its barges. Plaintiff brought suit to enjoin the mmercial use of the batture in violation of its or- nance. The lower court dismissed the suit, hold- g the ordinance to be unreasonable, arbitrary, d discriminatory. The appellate court affirmed. ne court stated that the use of the banks of vigable rivers is a public right. Everyone has a ee right to land and moor his vessels, although the nks belong to those who own the adjacent land. ne court held that the batture in question was thin the bank of the Mississippi River and that e riparian owner owned the batture subject to the rvitude of public use, i.e. that use which is in- dent to the nature and navigational character of e stream. The riparian owner could use the bat- re in any reasonable manner, provided he did not riously obstruct or impede the public use of the nks. The restriction of the batture to use as a sin- e-family residence was an unconstitutional use of e zoning power in conflict with the laws of the ate. (Barnett-Fla)

ILL V PORTER (PROPERTY LINES OF IPARIAN LANDOWNERS ON OPPOSITE IDES OF ABANDONED RIVERBED).

50 SW2d 306-308 (Ark 1970).

escriptors: *Arkansas, *Avulsion, *Boundaries Property), *Ownership of beds, Soil erosion, iver beds, Navigable rivers, Non-navigable aters, Valleys, Topography, Cutoffs, Riverflow, Thalweg, Accretion (Legal aspects), Boundary disputes, Real property, Dredging, Banks, Judicial decisions, Land tenure, Riparian land, Riparian rights.

As a result of a cut-off dredged by the Army Corps of Engineers, the Arkansas River abandoned its original channel. A boundary dispute arose between the riparian landowners on opposite sides of the abandoned river channel. Plaintiff landowner contended that the boundary should be a line through the channel equidistant from the channel's banks. Defendant landowner contended that the boundary should have been fixed along the thalweg of the river at the moment it became nonnavigable. The trial court accepted plaintiff's contention. On appeal, the Supreme Court of Arkansas stated that the state's title rests on navigability, and once the navigability ceases, the rights of the riparian owners attach to the beds. The court also cited with approval a previous United States Supreme Court decision wherein it was stated that when a river channel is changed by accretion, the boundary follows the course of the stream, but if the change is caused by avulsion, the boundary remains in the middle of the old channel. The court, in reversing the trial court, held that here the channel alteration was caused by avulsion, and once the river became non-navigable, the boundary line should have been fixed along the thalweg of the abandoned channel. CITIZENS COMM FOR HUDSON VALLEY V VOLPE (AUTHORITY TO ISSUE PERMITS FOR CAUSEWAY CONSTRUCTION).
425 F2d 97-107 (2nd Cir 1970).

Descriptors: *Hudson River, *Permits, *Federal government, *Administrative decisions, Highway effects, Bridge construction, Remedies, Rivers and Harbors Act, Environmental effects, Highways, Landfill, Dredging, Conservation, Water law, Legal aspects, Dikes, Natural resources, Recreation, Aesthetics, Administrative agencies, Judicial decisions.
Identifiers: *Army Corps of Engineers, Causeways.

Plaintiff citizen groups brought actions to enjoin defendant Army Corps of Engineers from issuing a permit authorizing the state to conduct a dredge and fill operation for an expressway project and to revoke the state's existing permit. Plaintiffs contended that the proposed expressway would adversely affect the local environmental and scenic resources and that the Corps of Engineers had exceeded its authority in approving the project since it contained dikes and causeways, which, by federal statute, could not be constructed without the consent of Congress and the approval of the Secretary of Transportation. Defendant argued that plaintiffs had no standing and that the Corps of Engineers did not have to consider the necessity of further federal approval before acting. The court held that civic groups concerned with preservation of natural, scenic and historic resources had standing to seek review of the Corps' decision. The court further held that the Corps of Engineers could not ignore the prospect of future federal approval. The court affirmed the district court's order revoking the state's dredge permit and enjoining issuance of a new permit without first obtaining the consent of Congress and the approval of the Secretary of Transportation. UNITED STATES V CERTAIN LAND IN THE COUNTY OF WORCESTER, STATE OF MARYLAND (VALUATION OF EASEMENTS IN CONDEMNATION SUIT).

311 F Supp 1039-1059 (D Md 1970).

Descriptors: *United States, *Maryland, *Easements, *Condemnation value, Condemnation, Compensation, Eminent domain, Economic impact, Beaches, Coasts, Shores, Harbors, Piers, Coastal structures, Docks, National parks, Federal government, Parks, Public lands, Land use, Judicial decisions, Legal aspects, High water mark, Low water mark.

The United States, plaintiff in condemnation suits brought for the establishment of a national park on an island off the coast of Maryland, sought to value certain reserved easements as nominal. Defendants, trustees of a liquidated landowners' corporation formed by the original individual owners of the island, argued that the easements were of more than nominal value. The easements included private use of the beach by members of the corporation, reservation of certain sites for a pier, a fuel dock, and a harbor site. The United States District Court of Maryland held that beach front property may be privately owned only to the high water mark, that the portion of the beach between high and low water marks is owned by the state for public use, and therefore that easements for the private use of the beach were only of nominal value. However, the remaining reserved commercial easements were held to be of more than nominal value. (Barker-Fla)

INTERESTS AND INTEREST GROUPS IN THE WATER POLICY PROCESS.
Colorado State Univ., Fort Collins.
Daniel M. Ogden.
In: Focus on Change: Intergovernmental Relations in Water Resources Planning, John Straayer, editor, Policy Science Paper No. 1, Department of Political Science, Colorado State University, Fort Collins, Colorado, January 1970, p 77-95.

Descriptors: *Political aspects, *Water resources, *Planning, *Resource development, Preservation, Institutions, Decision making, Regulation.
Identifiers: *Water resource policy, *Interest groups, Water resource politics, Pressure group system, Conflict resolution, Policy.

Politics is the critical ingredient in natural resources development decisions. Good engineering plans and economic analysis can determine whether a development is possible but politics decides whether it will be done. Water resource politics has been primarily interest group politics. Water issues are rarely settled on partisan political grounds. Water resources politics in the United States is based on two political foundations, the American political party and the pressure group system. The important characteristic of political parties is that they are based on consensus and compromise and as such are diffuse in direction

and goals. Three types of pressure groups, or political groups not seeking office, can be identified: service groups, political action groups, and goal groups. Pressure groups base their activity on the successful exploitation of access to political power holders. Three different thrusts in water politics are identified: a preservation thrust, a development thrust, and a regulationist thrust. A key to understanding politics in water resources decision-making is viewing politics as a process of conflict resolution. (See also W70-09628). (Davis-Chicago)

QUALITY OF THE URBAN ENVIRONMENT: THE FEDERAL ROLE,
Urban Inst., Washington, D.C.
Elizabeth H. Haskell.
The Urban Institute Publication 102-6, Washington, D.C., May 1970. 78 p, 4 graphs, 3 charts, 1 append.

Descriptors: *Federal government, *Planning, *Administration, *Institutions, Standards, Resource allocation, Regulation, Inter-agency cooperation, Coordination, Institutional constraints, Political aspects, Technology, Population.
Identifiers: *Urban environment, *Environmental quality, *Policy, Environmental problems, Resource policy, Goal, Urban ecology.

A number of recommendations are made regarding the role of the federal government in maintaining the quality of the urban environment. (1) National resource policy will benefit more people if its rural resource orientation is changed to an emphasis on scarce urban resources; air, water, and open space. (2) A comprehensive environmental quality policy stressing the following is needed: (a) study and publicize the interdependency of environmental systems, (b) reduce duplication of federal environmental quality activities and promote rational allocation of resources among the several programs, (c) assure that various environmental quality standards, planning and subsidy programs mesh, and (d) set a framework for identifying and managing the conflicts between environmental quality activities and environmental uses that substantially affect that quality, sponsored either by the public or private sectors. (3) Federal agency organization should reflect the following: (a) programs structure should match the structure of the problem, (b) programs involving similar goals can often profit from administrative proximity, (c) an organizational structure should promote administrative efficiency, and (d) organizational changes should take account of political realities. (4) Regional management of the environment is necessary to effectively deal with environmental problems. (5) Careful attention needs to be paid to the development of clear policy goals. (6) A prevention strategy rather than a reaction strategy is necessary. (7) A review of new technology would provide new insights into future problems. (8) A rational population policy has become a necessity and (9) An understanding of urban ecology must be developed. (Davis-Chicago)

ARNOLD'S INN, INC V MORGAN (PRESCRIPTIVE RIGHT TO FORESHORE BECAUSE OF LANDFILL).

310 NYS2d 541-550 (Sup Ct 1970).

Descriptors: *New York, *Landfill, *Ownership of beds, *Prescriptive rights, Shores, Marinas, Intertidal areas, Riparian rights, Local governments, Easements, Judicial decisions, Public lands, Public rights, Land tenure, Water law, Adjudication procedure, Relative rights, Remedies, Navigation, Fishing, Swimming, Access routes, High water mark, Low water mark
Identifiers: *View, Injunction (Mandatory)

Plaintiff restaurant owner sought an injunction to compel defendant marina operator to remove landfill which alledgedly cut off the restaurant patrons' view across the bay and thereby interfered with plaintiff's riparian rights. Plaintiff town filed action against the marina operator claiming the landfill trespassed upon the publicly owned shore. After reviewing the nature of the jus publicum, the right of the public to navigate the waters over the foreshore, and the jus privatum, the right of the foreshore's owner, the court dismissed plaintiff restaurant owner's claim, finding that plaintiff's riparian rights included access to the water for navigation, fishing, and bathing, but not an easement of view. As to the plaintiff town, defendant contended that he had acquired title to the public land by prescription. However, the town argued that there could be no adverse possession against a governmental authority. The court held that prescriptive rights may arise against a town where the land is alienable as was the case here; however, the evidence refuted defendant's possession of the land for the requisite prescriptive period. The court therefore granted the relief sought by the town and ordered defendant to remove the landfill. (Liptak-Florida)

WHY A NATIONAL WATER COMMISSION,
National Water Commission, Washington, D.C.
Theodore M. Schad.
In: Water Spectrum, Issues, Choices, Actions, Vol. 1, No. 2, Fall-Winter 1969-70, p 26-31. 5 photo.

Descriptors: *Water policy, *Water resources development, *Water management, *Planning, *Environmental effects, Economics, Socail aspects, Aesthetics, Administration, Legislation, History, Water conservation, Water demands, Water utilization, Water quality, Institutions.
Identifiers: *National Water Commission, Policy decisions, National water program, Alternatives.

Changes in national water policy are needed to assure that new demands for water will be met and to place limits on irreparable damage to our environment. The Nationa Water Commission was established to review present and anticipated rational water resource problems and alternative solutions. Advantages and disadvantages of solutions are studied with consideration of the economic and social consequences of water resources development on regional growth, on institutional arrangements, and on aesthetic values. The National Water Commission has outlined four general study areas as background for its deliberations and policy recommendations: (1) delineation of future problems and needs, (2) appraisal of existing water activities, (3) consideration of ways to improve existing institutions, and (4) analysis of objectives for the national water program. The article includes a resume of the history of the National Water Commission and its members, and a discussion of the authorizing legislation. Descriptions of the kinds of reports and studies presently being undertaken are given. It is hoped that the Commission's report and recommendations will be helpful in implementation of water policy decisions that reflect national objectives and that will not merely provide a program for economic development of the Nation's water supplies but will, also provide a program that protects the quality of the environment. THE CONSTRUCTION OF TRUST: AN EXPERIMENT IN EXPANDING DEMOCRATIC PROCESSES IN WATER RESOURCES PLANNING,
Michigan Univ., Ann Arbor. Dept. of Resource Planning and Conservation.
Spencer W. Havlick.
In: Water Spectrum, Issues, Choices, Actions, Vol. 1, No. 2, Fall-Winter 1969-70, p 13-19. 4 photo.

Descriptors: *Water management, *River-basin development, *Water resources development, *Planning, Community development, Institutions, Decision making, Methodology, Attitudes, Evaluation.
Identifiers: Susquehanna Experiment, Susquehanna River Basin, Atlantic Coast.

An experiment by the Corps of Engineers designed to improve trust in agency activities through increased communication and citizen participation in a multi-state comprehensive river basin planning study. Two major objectives of the Susquehanna experiment were: (1) to formulate alternative development and management strategies and present these to the public for preliminary consideration and (2) to incorporate preferences, or additional suggestions, of the 'recipient' citizenry in plans to accomodate the present and projected water-related needs. The research design and methodology sought first to identify the 'water resource influentials' in each county and community studied. These people were then involved in information workshops and public forums. The format of these workshops and forums is discussed in detail. Preliminary findings are given. The workshops were effective in directly influencing the planning staff, especially on localized adjustments. There were problems in differentiating between technical decisions and value judgments regarding the desirability of various alternative solutions. In conclusion, the engineering profession needs, in general, to create a greater sensitivity to citizen expectations in water resource planning. (Marriott-Chicago)

WATER PLANNING: MAKING A MESH OF THINGS,
Water Resources Council, Washington, D.C.
Henry P. Caulfield, Jr.
In: Water Spectrum, Issues, Choices, Actions, Vol. 1, No. 1, p 27-29, Summer 1969.

Descriptors: *Water Resources Planning Act, *Water management, *River basin development, Water resources, Assessments, Evaluation, Water conservation, Water utilization.
Identifiers: *Water Resources Council, Coordination.

The structure, functions, and activities of the Water Resources Council, established under the Water Resources Planning Act, are described. Principle members of the Council are the Secretaries of the Interior; Agriculture; the Army; Health, Education, and Welfare; Transportation; and the Chairman of the Federal Power Commission. Associate members are the Secretary of Commerce and the Secretary of Housing and Urban Development. Other Agency heads are asked to participate when topics touch on their responsibilities. Council functions are: (1) to maintain a continuing study and make a periodic assessment of the adequacy of the Nations' water supply; (2) to establish principles, standards and procedures for Federal participation in the preparation of comprehensive regional or river basin plans--and for the formulation and evaluation of Federal water and related land resources projects; (3) to review comprehensive river basin plans prepared by river basin commissions or interagency committees and transmit them together with the Council's recommendations, to the President for transmittal to Congress. Actions initiated as a result of these functions are given in some detail. (Marriott-Chicago)

SKOWYSZ V CITY OF VENTNOR (RIGHT OF CITY TO SELL PUBLIC BEACH).

110 N J Super 340, 265 A2d 554-561 (1969).

Descriptors: *New Jersey, *Beaches, *Accretion (Legal aspects), *Public lands, Cities, Legislation, Governments, Planning, Public benefits, Public

ights, Legal aspects, Water law, Coasts, Sands, hores, Recreation facilities, Bulkhead line, Jetties, ulkheads, reclamation, Coastal structures, Judi- ial decisions, Local governments.

laintiff taxpayers brought suit against defendant ity to set aside an ordinance authorizing the sale of ertain beach front land. Plaintiff also sought to en- oin the sale of the land. Plaintiffs argued that the nd in question was held by the city for public use s a recreation area and, as such, could not under, ew Jersey statute, be sold. Defendant argued that proposed plan for the construction of jetties ould through reclamation create new land below ie existing bulkhead and that the existing beach roperty would no longer be needed for public use. his, it was contended, exempted the sale from the atutory prohibition. The Superior Court of New ersey, reviewing a trial court decision for defen- ant, held that the proposed creation of new beach d not constitute reclamation, but was accretion, us falling outside of the statutory authority for le by a municipality of land no longer held for the ublic. The court ruled that reclamation contem- ates the construction of a new bulkhead and a lling-in of land, whereas accretion is merely an ad- tion to existing shore line. (Barker-Florida) 70-09650

NITED STATES V LOUISIANA (TEXAS OUNDARY CASE).

THE EXECUTIVE FUNCTION IN WATER RESOURCES PLANNING,
Delaware River Basin Advisory Committee, Trenton, N.J.
Walter M. Phillips.
In: Regional Development and the Wabash Basin p 157-165, University of Illinois Press, Urbana, 1964.

Descriptors: *Planning, *Water management, Water resources development, River basins, Delaware, Water resources, Governments, Local governments, State governments, Federal governments.
Identifiers: *Executive function, Political jurisdiction.

The thesis of this paper is that the executive role is essential in water resource planning, management, and development. The fact of multiple political jurisdictions exercising authorities over interstate rivers, coupled with normal complexities of three-level government-local, state, and federal-and further coupled with the diffusion of agencies dealing with water at both the state and the federal levels, has frustrated the executive process required for coherent dealing with water in many such river basins. To establish this point systematically would require an exhaustive treatise. This paper illustrates the water problems of the Delaware and describes the new governmental machinery created by the inter-state federal compact for the exercise of certain executive, quasi-judicial, and quasi-legislative functions relating to the waters of the Delaware. (See also W70-09656) (Loeb-Rutgers)

TOWN OF HEMPSTEAD V OCEANSIDE SMALL CRAFT MARINA, INC (ACTION BY TOWN TO RECOVER FAIR RENTAL VALUE OF ITS UNDERWATER LANDS USED BY DEFENDANT MARINA).

311 NYS2d 668-674 (Sup Ct 1970).

Descriptors: *New York, *Cities, *Marinas, *Beds under water, Rent, Recreation facilities, Boats, Docks, Inland waterways, Navigable waters, Leases, Ownership of beds, Riparian rights, Legal aspects, Judicial decisions, Access routes, Riparian land, Recreation, Structures, Piers, Tidal effects, Silting, Permits.

Plaintiff town sought to charge rent for defendant marina's use of underwater land belonging to the town. Because the marina owned the riparian land adjacent to the town's beds, it claimed the right to use the beds without rent as a matter of riparian right. The court held that the town could not charge rent for its underwater lands which were used primarily for access from defendant's docks to its upland riparian property. However, the court found that the operation of the marina in charging rent for the use of its docks and other facilities was a distinct activity. The town was therefore entitled to charge rent for that portion of its beds which were being used to support a commercial docking activity. Emphasizing that the case in no way impinged upon the right of the town to require a permit for the use of its property, the court held the town entitled to fair rental. (Caldwell-Florida)

KNOX COUNTY V MONCIER (INVERSE CONDEMNATION SUIT BROUGHT BECAUSE OF FLOODING CAUSED BY HIGHWAY CONSTRUCTION).
455 SW2d 153-158 (Tenn 1970).

Descriptors: *Tennessee, *Condemnation, *Flooding, *Highway effects, Damages, Road construction, Drainage, Highways, Flood damage, Floods, Land use, Legal aspects, Remedies, Drainage patterns, Payment, Judicial decisions, Legislation, Administrative agencies, Flooding, Land tenure.
Identifiers: *Inverse condemnation.

After the initiation of construction of a nearby highway, plaintiff's property was flooded. The State Highway Department subsequently made an effort to improve the drainage of plaintiff's land, but the property was later flooded again. Plaintiff filed suit seeking inverse condemnation of the property, claiming that the highway's alteration of his land's drainage patterns had made it unusable. Defendant county argued that the statutory one-year limitation on such suits began to run on the date of the original flooding and that plaintiff's suit was therefore barred. The court rejected this argument, holding that in view of the work done by the Highway Department after the first flood, the plaintiff could reasonably have thought the injury only temporary. The statute was triggered only when plaintiff knew or should have known that the injury to his property was permanent. The court held that this knowledge was not chargeable to plaintiff until after the second flood, and that his suit was not barred by the statute of limitations. (Caldwell-Florida)

STATE V JOHNSON (STATUTE RESTRICTING USE OF PLAINTIFFS' MARSHLAND HELD UNCONSTITUTIONAL).

265 A2d 711-717 (Me 1970).

Descriptors: *Maine, *Legislation, *Wetlands, *Land development, Marshes, Administrative agencies, Remedies, Land use, Landfills, Conservation, Legal aspects, Coastal marshes, Shore protection, Judicial decisions, Relative rights, Zoning, Reasonable use, Natural resources, Land classification, Property values, Land tenure.
Identifiers: *Constitutionality, *Police power.

A Maine conservation statute severely restricted the use which could be made of coastal wetlands. When plaintiffs' application to fill their marshlands for commercial development was denied, they sought to have the statute declared unconstitutional. The court found that the procedures provided by the statute were not deficient, but that the act as applied to defendants was an unreasonable exercise of the police power. The court found that the land was valueless without the requested fill. It was reasoned that to leave plaintiffs with commercially valueless land in order to uphold the restrictions imposed by the statute would be to charge plaintiffs with more than their just share of the cost of the statewide conservation program. The deprivation of reasonable use of plaintiffs' land was held unconstitutional. (Caldwell-Florida)

PUBLIC ACCESS TO BEACHES,
Steve A. McKeon.

Stanford Law Review, Vol. 22, p 564-586 (1970). 22 p, 135 ref.

Descriptors: *Beaches, *Public rights, *Access routes, *Recreation demand, Land tenure, Beneficial use, Recreation, Public benefits, Seashores, Intertidal areas, Littoral, Easements, Land use, Administrative agencies, Regulation, Land development, Legal aspects, Judicial decisions, Legislation, Prescriptive rights, Right-of-way, Social aspects, Relative rights.

Private ownership of beaches often conflicts with increasing public need for beach recreation areas. Intertidal portions of beaches are universally publicly owned, but the dry-sand areas are the desirable areas for recreation. Public rights can be established in privately owned beach property by the creation of beach parks through condemnation or through creation of easements into the dry sand beach area. Subdivision exactions offer one method of easement creation; beachfront developers can be required to dedicate a portion of the property to public use in the same manner as such developers are required to dedicate property for use as streets. In litigation to confirm rights based on public use, courts have generally favored recognition of the public right of access. Theories of implied dedication through the owner's inaction in the face of continued public usage have been employed. California courts have required only 5 years of public use to create an implied dedication. The common-law doctrine of customary rights has also been used in this regard. (Caldwell-Florida)

DEVELOPMENT OF INTERNATIONAL RIVER BASINS: REGULATION OF RIPARIAN COMPETITION,
Nitza Shapiro-Libai.
Indiana Law Journal, Vol. 45, p 20-55 (1969). 35 p, 127 ref.

Descriptors: *River basin development, *International law, *International waters, *Water resources development, River basins, International commissions, Governments, Riparian land, Treaties, Water allocation (Policy), Natural resources, Legal aspects, Relative rights, Water rights, Water utilization, Competing uses, Consumptive use, International Joint Commission, Equitable apportionment, Water demand, Priorities, Adjudication procedure, Political aspects.

Because of disagreements between nations, many river basins which straddle international boundaries remain underdeveloped, even though the technological tools for development are available. The author contends that the function of international law in this area should be to transfer to the legal plane the level of achievement attained on the technical plane. Outmoded oncepts of territorial supremacy and integrity hamper international river basin development. The territory supremacy principle gives each nation exclusive jurisdiction over the segment of the river within its boundaries. The territorial integrity principle is the opposite side of the coin, each nation being prevented under international law from altering the natural conditions within its own territory to the injury of a neighboring nation. The author argues that the best approach is to consider the river basin as a unit, using the principle of equitable apportionment to allocate water among nations sharing the river basin. Competing uses could thus be reconciled. International commissions could act as adjudicating agencies, and the peaceful development of water resources would be aided. (Caldwell-Florida)

THE FEDERAL-STATE OFFSHORE OIL DISPUTE,
James W. Corbitt, Jr.
William and Mary Law Review, Vol. 11, p 755-770 (1970). 15 p, 122 ref.

Descriptors: *Oil, *Federal jurisdiction, *State jurisdiction, *Ownership of beds, Continental shelf, Exploitation, Oil industry, Legal aspects, Judicial decisions, Submerged Lands Act, Coasts, Permits, Law of the sea, Legislation, Political aspects, Resource development, Resource allocation, Income, Leases, Boundaries (Property), Beds under water.

The ownership of offshore ocean beds has been historically a source of dispute between federal and state governments. Supreme Court cases awarding all ownership rights to the federal government were overruled by Congress when the Submerged Lands Act was passed. This act vested ownership of the beds, to a distance of at least three miles, in the coastal states. However, this Act has not resolved the difficulty as no feasible method of drawing a line between state and federal ownership has been devised. The author contends that no such 'absolute' solution is possible. The solution suggested by the author is one of wealth division, whereby the revenues derived from the exploitation of the offshore beds would be divided between the state and the federal governments. The underlying cause of the ownership dispute is the desire of each level of government to retain for itself the revenues from the seabed, and an equitable division of these revenues would accomplish a feasible solution. (Caldwell-Florida)

THE SOURCE AND SCOPE OF PUBLIC AND PRIVATE RIGHTS IN NAVIGABLE WATERS,
Leighton L. Leighty.
Land and Water Law Review, Vol. 5, p 391-440 (1970). 50 p, 224 ref.

Descriptors: *Navigable waters, *Public rights, *Federal jurisdiction, *Water rights, Non-navigable waters, Recreation, Riparian rights, Prior appropriation, Tidal waters, Ownership of beds, Legal aspects, Judicial decisions, Navigable rivers, Transportation, Treaties, Admiralty, Recreation, Inland waterways, Land tenure, Federal government, State jurisdiction, Regulation, Usufructuary right, Federal-state water rights conflicts.
Identifiers: *Constitutions.

The federal test of navigability is whether the body of water in question is in fact navigable or suitable for reasonable commercial use. Federal jurisdiction prevails over state control if the body of water is considered navigable, and this can make considerable difference in allocation of public and private rights. Federal controls over navigable waters have been exercised in areas of legitimate national concern. The federal test for navigability is mandatory only where ownership of beds of navigable waters is determinative. State owned beds may be disposed of under state law. Rights tg surface use, as opposed to bed ownership, is generally determined by state law. The author contends that the navigability test of determining private and public rights may well have outlived its usefulness. The general welfare, war powers, and commerce clause provisions of the Constitution give Congress an adequate base for jurisdiction over waters important enough to warrant national control. Determination of rights as to other waters should be left to state law. (Caldwell-Florida)

THE TRANSFER OF WATER RIGHTS FOR USE IN THE OIL INDUSTRY,
Paul S. Galeotos.
Land and Water Law Review, Vol. 5, p 441-448 (1970). 8 p, 32 ref.

Descriptors: *Water rights, *Industrial water, *Water utilization, *Oil industry, Riparian rights, Prior appropriation, Competing uses, Beneficial use, Leases, Land tenure, Water allocation (Policy), Economics, Priorities, Water contracts, Legal aspects, Natural flow doctrine, Diversion, Reasonable use, Water demand, Judicial decisions, Riparian land, Remedies, Consumptive use.

The author of this comment contends that water rights must be made freely transferable in order to stimulate industrial growth. Otherwise new industries will be unable to obtain needed water. In states following the prior appropriation doctrine unappropriated water may be acquired by complying with appropriation statutes. Generally, a lessee may appropriate water rights. In any case, the appropriation must be for a beneficial purpose. Where waters are already appropriated, reallocation problems arise. Resource developers may often purchase water rights from a prior appropriator and change its use--subject only to state law and to the rights of superior appropriators. Statutes unduly restricting change of use hamper industrial development. In riparian-rights states which follow the natural flow doctrine, any substantial withdrawal from a stream is enjoinable by downstream owners. The reasonable use doctrine of riparian law is more flexible. In view of increasing industrial demands, both the appropriation and the riparian rights doctrines need to be liberalized to provide increased flexibility in providing adequate water supplies to all. VALIDITY AND CONSTRUCTION OF ANTI-WATER POLLUTION STATUTES OR ORDINANCES.
Annot, 32 ALR3d 215-316 (1970). 102 p.

Descriptors: *Pollution abatement, *Water pollution, *Legislation, *Judicial decisions, Water pollution control, Water resources development, Legal aspects, Governments, Administration, Water law, Non-structural alternatives, Pollutants, Water quality control, Water pollution treatment, Public health, Standards, Riparian rights, Water allocation (Policy), Administrative decisions.

This annotation collects the cases in which the courts have construed or passed upon the validity of statutes or ordinances designed to control or prohibit the pollution of public waters. The annotation also includes administrative regulations or orders that are general anti-pollution measures. The subject of water pollution is within the police power of the state to protect the public health. Anti-water pollution statutes are attacked on various grounds: (1) unlawful taking or similar unreasonableness; (2) local, special or private legislation; (3) lack of authority; (4) unlawful delegation of authority, power or jurisdiction; (5) illegal promulgation; and (6) arbitrary classifications. Administrative regulations and ordinances regarding water pollution have been more prone to invalidation than have statutes. In constructing anti-water pollution measures, certain elements of specific violation have been examined by the courts: (1) the polluter, (2) the intent, (3) the pollutant, (4) the causation, (5) the pollution, and (6) the waters. Some courts have held that alleged prescriptive rights, alleged reasonable or necessary uses, and alleged financial burdens do not constitute defenses to violation of anti-water pollution measures. (Powell-Florida)

LIABILITY OF UNITED STATES UNDER FEDERAL TORT CLAIMS ACT FOR DAMAGE FROM FLOODING.
Annot, 4 ALR Fed 723-745 (1970). 23 p.

Descriptors: *Flooding, *Federal government, *Remedies, *Legislation, Flood damage, Floods, Flood protection, Legal aspects, Flood control, United States, Judicial decisions, Water policy, Flood forecasting, Adjudication procedure, Water rights, Projects, Federal project policy, Navigation, Irrigation, Wildlife conservation, Drainage programs.
Identifiers: *Governmental tort immunity.

In this annotation cases are collected which discuss the liability of the United States under the Federal Tort Claims Act for property damage resulting from floods or flooding. The cases annotated represent both claims allowed and barred and are

cataloged under: (1) flood control; (2) irrigation, reclamation, and conservation; (3) navigation projects; (4) flood or weather forecasting; (5) wildlife preservation and control; and (6) maintenance of drainage facilities. A claim against the government will not lie where it is determined that it arose out of certain express exclusionary clauses in the Tort Claims Act, namely, a claim arising out of a discretionary function or duty, or a claim arising out of misrepresentation. The discretionary exclusion has precluded recovery: for flood damage claims based on government flood control project activities; irrigation, reclamation and conservation project activities; and various other government programs and projects connected with waterways. The misrepresentation exception has barred flood damage claims under complaints alleging inaccurate or misleading flood or weather forecasting. A statutory immunity for flood damage is also provided in the Federal Flood Control legislation. (Powell-Florida)

TITLE TO SUBMERGED LAND IN FLORIDA,
Richard Sollner.
Florida State University Law Review, Vol. 1, p 1-5 (1970). 16 p.

Descriptors: *Riparian rights, *Florida, *Ownership of beds, *Boundaries (Property), Legal aspects, Tidal waters, Seashores, Navigable waters, High water mark, Beds, Beds under water, Land tenure, Foreign countries, Governments, Judicial decisions, Water law, Navigable rivers, Civil law, Public rights, Treaties, Prior appropriation, History.
Identifiers: Land grants.

In this law review article Spanish law applicable to Florida from 1783-1821 is surveyed. Spanish ordinances have been interpreted to hold that navigable waters and the land thereunder were held by the Crown for public common use, and that grants of tidal waters would be inconsistent with the King's own ordinances. However, there is justification for the conclusion that certain administrative officials were delegated the power to grant private ownership in water bottoms in connection with land grants. Under the Treaty of 1819, in which Florida was ceded to the United States, the United States agreed to confirm and ratify all grants made by the King or his lawful authorities. The treaty of cession transferred only such rights as Spain owned and could convey. The United States would not receive title to the waters and lands under the waters if Spain had validly granted them to others. American interpretation of Spanish law and land grants is reviewed. The Florida Supreme Court has indicated that, in order for a Spanish grant to convey title to submerged land, it must clearly and specifically indicate such intention and be granted for a public purpose or for the advantage of the public. MAGNOLIA APARTMENTS, INC V HANES (CLAIM OF DAMAGE CAUSED BY INCREASED FLOW FROM UPHILL PROPERTY).
174 SE2d 828-832 (NC Ct App 1970).

Descriptors: *North Carolina, *Diversion, *Saturated flow, *Seepage, Flood damage, Alteration of flow, Drainage, Drainage systems, Ditches, Drainage engineering, Damages, Pipes, Storm drains, Surface runoff, Drainage water, Subsurface flow, Natural flow, Obstruction to flow, Railroads, Legal aspects, Pondage, Flow nets, Groundwater movement.

Defendant's land lay uphill from plaintiff's property and was separated from it by a railroad. Plaintiff claimed that a landfill on defendant's property had caused excessive seepage of groundwater onto plaintiff's property, saturating the soil and causing damage. The court held that while defendant could not divert water from its natural course so as to damage another's property, he had the right to increase the flow from his property onto plaintiff's. The evidence was held insufficient to show diversion or anything more than merely increased flow. The real cause of the soil saturation was found to be seepage from an accumulation of water against the railroad embankment on defendant's side. This accumulation was itself caused by broken and stopped-up drainage pipes under plaintiff's property. These pipes normally ran from defendant's land under plaintiff's land to storm drains farther downhill. In absence of any showing that defendant's fill operations had caused the pipes to fail, the action was dismissed. (Caldwell-Florida)

OFFSHORE MINERAL RESOURCES: A CHALLENGE AND AN OPPORTUNITY.
President's Panel on Oil Spills, Offshore Mineral Resources: A challenge and an Opportunity (1969). 17 p.

Descriptors: *Resource development, *Resource allocation, *Mineralogy, *Mineral industry, Federal government, Regulation, Water resources development, Shores, Coasts, Drilling, Administrative agencies, Resources, Conservation, Economics, Research and development, State governments, Local governments, Exploitation, Oil fields, Natural gas, Legal aspects.

The President's Panel on Oil Spills examined four areas: (1) mineral resources and multiple use, (2) pollution and safety, (3) evaluation of offshore resources, and (4) central planning and local interest. The Panel recommended that: (1) a Resource Advisory Board be established to advise on all matters pertaining to the development of resources; (2) prompt efforts be made to incorporate the advice and policies of state and local governments into the plans for development of the federal offshore mineral resources; (3) well-publicized public hearings be held in the areas where offshore resource developments are contemplated; and (4) data necessary for resource evaluation held by private companies, state and local governments and any other parties to exploration and development of offshore mineral resources be made available to those who must make decisions about their exploitation. The Panel also suggested that a class of escrow resources be recognized as a matter of policy. These resources would be placed in escrow for fixed periods of time instead of being extracted at present. (Powell-Florida)
W70-09788

NATIONAL ENVIRONMENTAL POLICY ACT OF 1969.
H R Rep No 91-765, 91st Cong, 1st Sess (1969).

Descriptors: *United States, *Legislation, *Environment, *Ecology, Resource development, Legal aspects, Political aspects, Environmental effects, Federal government, Administrative agencies, Administration, Public health, Public benefits, Non-structural alternatives, Natural resources, Conservation, Land use, Supervisory control (Power), Planning, Water policy.

The purposes of the National Environmental Policy Act are: (1) to declare a national policy which will encourage productive and enjoyable harmony between man and his environment; (2) to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; (3) to enrich the understanding of the ecological systems and natural resources important to the nation; and (4) to establish a Council on Environmental Quality. A declaration of national environmental policy is presented. The organization, duties and functions of the Council on Environmental Quality are enumerated. A statement of the House managers at the Senate House conference is set forth. (Powell-Florida)

ACT NO 769 (DISPOSAL FROM WATERCRAFT OF LITTER AND UNTREATED SEWAGE PROHIBITED).
Acts of Alabama, Act No 769 (1969).

Descriptors: *Alabama, *Sewage disposal, *Sewage, *Boats, Sewage treatment, Legislation, Legal aspects, Environmental sanitation, Water resources development, Regulation, Pollution abatement, Water pollution control, Waste disposal, Waste storage, Waste treatment, Marinas, Navigable waters, Permits, Regulation, Administrative agencies, Ships.
Identifiers: *Toilets.

The discharge of litter, untreated sewage from marine toilets, and other materials from a watercraft into Alabama waters is prohibited. The treatment of sewage discharged by marine toilets is required. The State Board of Health is authorized to adopt rules and regulations for the discharge of sewage and litter from watercraft, including permit requirements for manufacturers of marine toilets and devices. Marinas are required to furnish litter or trash receptacles for use by watercraft occupants. (Powell-Florida)

ACT NO 773 (TRANSFER OF PUBLIC WATER SYSTEMS: PROCEDURES).

Acts of Alabama, Act No 773 (1969).

Descriptors: *Alabama, *Water districts, *Water works, *Municipal water, Utilities, Regulation, Legislation, Legal aspects, Water supply, Administration.

Every public corporation which is organized in Alabama pursuant to authorization by a municipality and which owns a water system, and every municipality in Alabama in which any part of such water system is situated, is authorized to transfer and convey such systems to any other public corporation. The governing body of each transferor municipality and each transferor public corporation must authorize the conveyance of the water system through appropriate resolutions. The procedure for transfer of a water system accompanied by a lien is set forth. The form for publishing notice of a water system transfer is also prescribed. (Powell-Florida)
W70-09791

ACT NO 472 (STATE DOCKS DEPARTMENT AUTHORIZED TO CONSTRUCT AND MAINTAIN INTERNAL IMPROVEMENT FACILITIES; VARIOUS POWERS AND PURPOSES).
Acts of Alabama, Act No 472 (1969).

Descriptors: *Alabama, *Administrative agencies, *Docks, *Supervisory control (Power), Water resources development, Facilities, Engineering structures, Legis.ation, Legal aspects, State governments, Multiple-purpose projects, Right-of-way, Condemnation, Construction, Project purposes, Watercourses (Legal), Water conservation, Water utilization, Maintenance, Permits, Navigable waters, Streams.

This Alabama legislation authorizes the State Docks Department to promote and aid the commercial flow of agricultural products and the use of the waterways of the state. The Department is also

authorized to engage in works of internal improvement by promoting, developing, constructing, maintaining and operating within the state or along navigable streams and waterways all manner of facilities consistent with the 1969 Docks Amendment. The Department has the power to acquire rights-of-way and property necessary for the construction of facilities by gift, lease, purchase, negotiation, or condemnation. The Department may revoke any license granted by the state and may permit upland owners to occupy any part of the space between the high water mark and the low water mark of any navigable waterway or along the banks of any river, stream or waterway. (Powell-Florida)
W70-09792

AN ACT TO AMEND THE ALABAMA WATER MANAGEMENT ACT.
Acts of Alabama, Act No 442 (1969).

Descriptors: *Water districts, *Alabama, *Administration, *Water management (Applied), Legislation, Legal aspects, Drainage systems, Water conservation, Water utilization, Water resources development, Agricultural engineering, Civil engineering, Eminent domain, Flood protection, Flood control, Right-of-way, Taxes, Assessments, Adjudication procedure, Supervisory control (Power).

The procedure for the organization of a water management district is prescribed. Upon the filing of a petition signed by a majority of the landowners owning more than one-third of the land in a proposed district, the probate court of the county in which the lands are located appoints a civil or agricultural engineer. The duties of the engineer are enumerated. A probate court hearing is conducted for the benefit of those realty owners affected by the proposed district. The water management district, once incorporated by the probate court, is authorized to exercise the powers of eminent domain for the purpose of securing adequate outlets, floodwater retarding structure sites, and such other necessary rights-of-way. The district is authorized to perform all acts necessary and proper for the carrying out of the district's purpose. The method of allocating costs and levying taxes to defray the organizational expenses of the district is set forth. (Powell-Florida)

SEWAGE FACILITIES--PERMITS--INSPECTION.
Penn Gen Laws Act No 43 (1970) (amending Pub Laws 1535).

Descriptors: *Pennsylvania, *Sewage disposal, *Sewerage, *Permits, Sewage, Environmental sanitation, Sewage districts, Legislation, Legal aspects, Sanitary engineering, Sewage treatment, Pipelines, State governments, Regulation.

The Pennsylvania Sewage Facilities Act is amended to include the definition of 'individual sewage system': a single system of piping, tanks or other facilities serving one or two lots and collecting and disposing of sewage in whole or in part into the soil of the property or into any waters of this Commonwealth. 'Rural residence' is defined as a structure occupied or intended to be occupied by not more than two families on a tract of land of ten acres or more. An individual or community sewage disposal system shall not be installed without a permit indicating that the site and the plans and specifications of such system are in compliance with the provisions of the Pennsylvania Sewage Facilities Act. Enumerated municipal and county departments are exempted from the permit requirement. (Powell-Florida)
W70-09794

ACT NO 479 (LEASE OF STATE HELD MINERAL, OIL AND GAS RIGHTS UNDER WATER).
Acts of Alabama, Act No 479 (1969)

Descriptors: *Leases, *Alabama, *Natural resources, *Beds under water, Conservation, Water resources development, Legislation, Legal aspects, Regulation, Exploitation, Oil fields, Mining, Navigable waters, Streams, Bays, Bayous, Lakes, Lake beds, Gulf of Mexico, Lagoons, Estuaries, Mineralogy, Oil, Natural gas.

Under the provisions of this Act, all lands proposed to be leased for oil, gas or mineral exploitation shall be leased only upon the basis of competitive bids. The procedure for the competitive bidding, as conducted by the Director of Conservation, is set forth. All revenue accruing from the lease of the bed of any navigable streams, waterways, bays, estuaries, lagoons, bayous, lakes, and any submerged lands in the Gulf of Mexico within the seaward boundary of Alabama shall become a part of the state's general funds. (Powell-Florida)

RIGGS V CITY OF SPRINGFIELD (ACTION TO ABATE TEMPORARY NUISANCE NOT BARRED BY STATUTE OF LIMITATIONS).
96 SW2d 392-400 (Mo Ct App 1936).

Descriptors: *Missouri, *Water pollution, *Sewage, *Remedies, Cities, Municipal wastes, Judicial decisions, Legal aspects, Local governments, Reasonable use, Waste disposal, Sewage treatment, Sewage disposal, Riparian rights, Pollution abatement, Damages, Adjudication procedure, Legislation, Streams.
Identifiers: Nuisance (Temporary), Nuisance (Permanent).

In 1893, defendant city erected a general sewer system whereby the untreated sewage from the city was discharged into a nearby creek. In 1913 and 1928, defendant city installed, remodeled and improved sewage plants. Plaintiff landowners brought an action for damages caused by the alleged failure of the defendant city to properly purify sewage emptying into the creek. The creek ran through the property of plaintiff landowners. Plaintiffs' case theory was that the city had established a temporary nuisance about one year after the completion of the 1928 plant. Defendant contended that the general sewer system had been maintained since 1893, thus giving defendant a prescriptive right to use the creek and barring plaintiffs' action because of the statute of limitations thereon. The Springfield Court of Appeals affirmed the trial court's decision for plaintiffs and held that the complaint was not barred where the nuisance was temporary or abatable and not permanent. The dissenting opinion argued that a permanent injury was created in 1893 and plaintiffs would have been entitled to consequential damages only had they instituted a suit within the statutory period. (Powell-Florida)
W70-09825

AMERICAN RED CROSS V HINSON (ELEMENTS REQUIRED TO ESTABLISH NAVIGABILITY FOR FEDERAL LAW PURPOSES).

122 SW2d 433-435 (Tenn 1938).

Descriptors: *Tennessee, *Jurisdiction, *Navigable rivers, *Overflow, Non-navigable waters, Judicial decisions, Legal aspects, Levees, Flooding, Floods, Navigable waters, Mississippi River, Admiralty, Federal government, Federal jurisdiction, Legislation, State jurisdiction, Water courses (Legal).

Plaintiff widow sued defendant under the Tennessee Workmen's Compensation Law for the accidental death of her husband arising out of and in the course of his employment. The place of the accident was within a levee on the Arkansas side of the Mississippi River, but some distance from the river bank. The area was usually dry land and was covered with water only during flooding. Defendant contended the accident occurred on navigable water and that any recovery by plaintiff must be had under the Federal Longshoreman and Harbor Workers' Compensation Act or the Jones Act. The court agreed with the trial judge that the accident took place on overflowed lands, not navigable waters, and that plaintiff was entitled to recover under state law. To constitute a navigable stream the seasons of navigability must occur regularly and be of sufficient duration to serve a useful public purpose for commercial intercourse. The judgment for plaintiff was affirmed. (Price-Florida)

RAULS V COSTNER (DRAINAGE DISTRICT'S LIABILITY FOR FLOOD WATERS CAUSED BY ERECTION OF NEW LEVEE).

143 SW2d 1090-1094 (Ark 1940).

Descriptors: *Arkansas, *Levees, *Drainage districts, *Flood damage, Dams, Surface drainage, Water injury, Flooding, Compensation, Remedies, Flood control, Judicial decisions, Adjudication procedure, Legal aspects, Water law, Riparian water, Riparian land, Natural flow doctrine, Streamflow, Rivers, Navigable rivers, Surface water, Lakes, Streams, Impounded waters.
Identifiers: *Servitudes.

Plaintiff landowner brought an action against defendant drainage district for damages to plaintiff's land caused by the construction of a new levee. The levee raised the water level adjacent to plaintiff's land, subjecting it to increased flooding at times of high water. Plaintiff contended that his property was protected from flood waters by the old levee but not by the new levee. Defendant argued that there was insufficient evidence to support plaintiff's contentions and that there could be no liability for leaving riparian land exposed to floods, a natural servitude of such land. Reversing a judgment for plaintiff, the court held that a riparian owner takes his land subject to possible flood damage, and a drainage district is not liable for such damage unless it can be shown that the levee has caused the flood waters to be permanently impounded on plaintiff's land. (Liptak-Florida)

STRECKFUS STEAMERS, INC V KEITEL (MISSISSIPPI RIVER EMPLOYEES NOT EXEMPT FROM UNEMPLOYMENT TAX AS AN EXCISE ON THE USE OF THE RIVER).

182 SW2d 587-589 (Mo 1944).

Descriptors: *Mississippi River, *Navigation, *Taxes, *Employment, Missouri, Navigable rivers, Tariff, Boats, Unemployment, Compensation, Insurance, Welfare (Economics), Occupations, Personnel, Administrative agencies, Administrative decisions, Interstate rivers, Transportation, Highways, Ships, Cruises, Judicial decisions, Legal aspects, State governments, Legislation.

Plaintiff steamboat operator sought judicial review of a decision by defendant unemployment compensation commissioner to the effect that plaintiff's employees were subject to state unemployment compensation tax. Plaintiff contended that since both the Missouri constitution and federal law provide that the Mississippi River is a public highway

d that use of the river should be free to all thout any tax, duty, or toll, his employees who erated boats on the river were exempt from the x. Defendant contended that the tax was on em-oyment, not navigation of the river, and hence s not a toll for use of the river but a general tax posed on all citizens engaged in any kind of em-oyment. Reversing a lower court judgment for aintiff, the Supreme Court of Missouri held that e fact that plaintiff's employees happened to ork on the river did not convert the unemploy-ent tax into a tax upon the use of the river, nor d it exempt them from the imposition of the tax. iptak-Florida)
70-09912

ENTUCKY GAME AND FISH COMM'N v IRNETT (STATE FISH COMMISSION'S LIA-LITY FOR FLOOD DAMAGE CAUSED BY RECTION OF DAM FOR FISH HATCHERY).
0 Ky 786, 163 SW2d 50-53 (1942).

escriptors: *Kentucky, *Dams, *Flood damage, ish hatcheries, State governments, Administra-e agencies, Backwater, Water injury, Compensa-n, Condemnation, Condemnation value, minent domain, Streams, Judicial decisions, Legal pects, Adjudication procedure, Water law, blic rights, Property values, Land appraisal, oding, Damages, Access routes.

aintiff landowner brought an action against de-ndant state game and fish commission for mages resulting from defendant's construction of lam and a fish hatchery. The construction caused rtial flooding of plaintiff's land and the destruc-n of a creek ford which was plaintiff's means of gress and egress. Plaintiff argued that he was enti-d to damages and an injunction restraining de-ndant from maintaining the dam. Defendant con-ted the proof of damages. Affirming a judgment r plaintiff on the damages and for defendant on e injunction, the Court of Appeals of Kentucky ld that conflicting proof of damages was properly bmitted to the jury. As to the injunction, the urt pointed out that the damage award was tan-mount to a condemnation and, upon satisfaction the judgment, defendant would be vested with e right to maintain the dam in its present condi-n. (Liptak-Florida)
70-09913

UST V CITY OF NEWPORT (CITY'S LIABILI-Y FOR WATER DAMAGE TO PROPERTY LONG NEW ROAD CONSTRUCTION).
4 Ky 567, 145 SW2d 511-512 (1940).

escriptors: *Kentucky, *Road construction, *Set-ment (Structural), *Surface runoff, Diversion, ainage water, Cities, Local governments, Adju-cation procedure, Judicial decisions, Legal pects, Damages, Roads, Paving, Washouts, Sub-lence, Flood damage, Water injury, Surface ainage, Adjudication procedure.

aintiff landowner brought an action against de-ndant city to recover damages to plaintiff's use. The damage was allegedly caused by diver-n of water onto plaintiff's property by defen-nt's street construction. Plaintiff contended that e street was so negligently constructed as to use water to collect on his property, resulting in ttlement and cracking of his floor and walls. De-ndant denied the negligence and offered proof of her causes of plaintiff's damage. Affirming a dgment for defendant, the court held it would not erturn the jury's verdict when there was suffi-ent evidence to support it, especially when the y had viewed the premises. (Liptak-Florida)
70-09931

YLE V ST FRANCIS LEVEE DIST (LEVEE STRICT'S LIABILITY FOR WATER AMAGE CAUSED BY INTERFERENCE WITH URFACE DRAINAGE).
3 SW2d 391-393 (Mo Ct App 1941).

Descriptors: *Missouri, *Repulsion (Legal aspects), *Levees, *Surface runoff, Water injury, Damages, Judicial decisions, Legal aspects, Dikes, Flood control, River regulation, Underseepage, Mississippi River, Surface waters, Drainage water, Rain water, Surface drainage, Standing waters, Cultivated lands, Arable land, Federal government, Administrative agencies, Land tenure, Saturated soils.
Identifiers: *Levee districts.

Plaintiff landowner brought an action against defendant levee district to recover damages for water injury to his property. The damage was allegedly caused by the erection of a new levee which interfered with the natural surface drainage of plaintiff's property. Plaintiff contended that his property had been useful for farming since the construction of the old levee, but that the new levee had interfered with his natural drainage, making his fields soggy and swampy. Defendant denied the injury to the property and argued that the federal government had built the new levee and should be liable for damage caused thereby. Reversing a judgment for plaintiff, the court noted that plaintiff's land was obviously damaged, but held that since defendant had not built and did not own the levee, but merely maintained it, defendant could not be liable for injuries caused by the construction. (Liptak-Florida)
W70-09940

STEWART V CITY OF SPRINGFIELD (CONSTRUCTIVE CONDEMNATION OF A STREAM BY POLLUTION).

165 SW2d 626-631 (Mo 1942).

Descriptors: *Missouri, *Condemnation, *Local governments, *Water pollution, Appropriation, Community development, Eminent domain, Human population, Judicial decisions, Legal aspects, Proprietary power, Public rights, Relative rights, Riparian land, Riparian rights, Riparian waters, Sewage districts, Watercourses (Legal), Pollution abatement, Damages, Sewage, Remedies.
Identifiers: *Nuisance (Legal).

Defendant city built sewers which emptied into and polluted a stream which flowed through plaintiffs' lands. In three separate suits, plaintiffs brought actions against defendant for creating an abatable temporary nuisance. Plaintiffs received judgments in each case. Defendant reserved the right to raise any defenses it might have in future suits. In a fourth suit defendant claimed that it had long since appropriated the use of the creek under its right of eminent domain and that the statute of limitations had run against all of plaintiffs' claims. Plaintiffs asserted that defendant was estopped to use this defense. The court held that since previous judgments could not estop plaintiffs from future claims of permanent damages, they did not estop the city from asserting its permanent appropriation. The court further held that a municapality could, and in this case did, appropriate a stream for sewer purposes without instituting proceedings to condemn it by eminent domain. Normally, riparian owners would be entitled to full compensation for damages to their land caused thereby. In the case, however, the statutory period for filing for such damages had run. (Clarke-Florida)
W70-09979

MADDOX V INTERNATIONAL PAPER CO (PAPER MILL'S LIABILITY FOR FISHKILL CAUSED BY WATER POLLUTION).

47 F Supp 829-832 (WD La 1942).

Descriptors: *Louisiana, *Water pollution, *Pulp wastes, *Fishkill, Commercial fishing, Acid streams, Pollution abatement, Riparian rights, Pollutants, Water pollution effects, Remedies, Legal aspects, Water law, Adjudication procedure, Judicial decisions, Legislation, Riparian waters, Industrial wastes, Pulp and paper industry, Pulp wastes.

Plaintiff fishing camp operator sought damages and an injunction because of defendant paper company's operations which polluted the water, killing the fish and destroying plaintiff's fishing business. Plaintiff contended that defendant paper company, being an upstream owner, was liable for any damage suffered by downstream owners caused by the discharge of acids and other pollutants from defendant's settling basins. Defendant argued that plaintiff could not recover for the death of the fish because fish are property of the state and not subject to private ownership. The court held that, since under the Louisiana Code every act which causes damage to another is the proper subject of reparation, plaintiff was entitled to recover for lost profits. However, with an adequate remedy at law, plaintiff was not entitled to an injunction. The court also noted that defendant's efforts to prevent the pollution would protect it from punishment, but were no defense to an action for damages. (Liptak-Florida)
W70-09980

HAMPTON V NORTH CAROLINA PULP CO (ACTION TO RECOVER FOR FISHKILL CAUSED BY PULP WASTES).
49 F Supp 625-632 (ED NC 1943).

Descriptors: *North Carolina, *Fishkill, *Commercial fishing, *Water pollution effects, Commercial fish, Stream fisheries, Fishing, Spawning, Fish reproduction, Fish migration, Riparian rights, Usufructuary right, Water pollution, Wastes, Pollutants, Water pollution sources, Damages, Judicial decisions, Legal aspects, Remedies.

Plaintiff riparian landowner brought an action against defendant company to recover for lost revenue caused by defendant's destruction of fish. Defendant's pulp plant discharged certain amounts of waste products into the river, and plaintiff claimed his fisheries were deprived of their expected catch. The United States District Court for the Eastern District of North Carolina ruled that plaintiff had no interest in the fish before reduction to acual possession, but had only a right to fish in the river in common with the public. The case was dismissed. (Barker-Florida)
W70-09981

UNITED STATES V FLORIDA POWER AND LIGHT CO (INJUNCTION AGAINST THERMAL POLLUTION).
311 F Supp 1391-1392 (SD Fla 1970).

Descriptors: *United States, *Florida, *Thermal pollution, *Electric powerplants, Facilities, Water pollution, Heated water, Pollutants, Pollution abatement, Temperature, Governments, Legislation, Remedies, Aquatic life, Damages, Judicial decisions, Legal aspects, Adjudication procedure.
Identifiers: *Biscayne Bay.

The United States sought a temporary injunction against defendant power company to prevent further discharge of heated water into Biscayne Bay, Florida. Plaintiff contended that such thermal pollution was dangerous to the marine life of the bay. The United States District Court for the Southern District of Florida held that even though injunctive relief in such a case was proper under the Rivers and Harbors Act, the injunction would not be issued in the absence of a showing of irreparable harm. Such irreparable damage not having been proved, the injunction was not granted. (Barker-Florida)

INTERNATIONAL SHOE CO V HEATWOLE (PRIVATE CAUSE OF ACTION FOR POLLUTION).

30 SE 2d 537-541 (W Va 1944).

Descriptors: *West Virginia, *Water pollution, *Riparian rights, *Riparian waters, Judicial deci-

sions, Legal aspects, Impaired water quality, Nonconsumptive use, Pollution abatement, Streams, Pollutants, Reasonable use, Wastes, Water pollution effects, Industrial wastes, Chemical wastes, Industrial plants, Industrial production, Competing uses, Industrial water, Aesthetics, Jurisdiction, Recreation, Relative rights, Remedies.

Plaintiff landowner, in an action brought before a justice of the peace, sought compensation for damages allegedly caused by defendant industry's discharge of waste into a river abutting plaintiff's property. Damages alleged included discoloration of the water, interference with fishing in the river, and a decrease in value of plaintiff's property. The justice held for plaintiff. Defendants sought a writ of prohibition in the Supreme Court of Appeals of West Virginia to forbid the enforcement of the judgment. Defendants contended that pollution of a stream is a public wrong creating no cause of action enforceable by a riparian owner and that no private damage was done plaintiff. The court held that pollution of a river is a public wrong and, to recover damages, a riparian owner must show damage of a different character than that of the public at large. A riparian owner has not proprietary right in a river's beauty, nor does he have an exclusive right to fish or bathe. Plaintiff would have had a right of action if sediment from defendant's plant had been deposited on his land. However, since plaintiff nowhere alleged that his use of his land was interfered with, the judgment in his favor was improper. A writ of prohibition was issued forbidding enforcement of the judgment. (Dye-Florida)

UNITED STATES V 25.4 ACRES OF LAND (OWNERSHIP OF RIPARIAN LAND CREATED BY LANDFILL--CONDEMNATION PROCEEDINGS).
52 F Supp 75-89 (ED NY 1943).

Descriptors: *United States, *New York, *Land tenure, *Condemnation, Cities, Riparian land, Land, Real property, Eminent domain, Governments, Compensation, Bulkheads, Landfills, High water mark, Low water mark, Ownership of beds, Boundaries (Property), State governments, Judicial decisions, Legal aspects, Boundary disputes.

In a condemnation proceeding, the State of New York and the City of New York objected to the payment of certain awards to the alleged owners of the condemned property. Both governments challenged the titles of the owners and claimed that title had remained vested in the respective governments. A portion of the land in question had originally been underwater, but had been bulkheaded and filled by the predecessors in title of the alleged current owners. The United States District Court, Eastern District of New York, ruled that an examination of both the grants and subsequent possesstion of the land in question showed good title to be in the alleged owners, not in either of the governments. The full condemnation awards were given the owners. (Barker-Florida)

CHICK SPRINGS WATER CO V STATE HIGHWAY DEPT (STATE'S LIABILITY FOR FLOOD DAMAGE CAUSED BY NEGLIGENT CULVERT CONSTRUCTION).
183 SE 27-33 (SC 1935).

Descriptors: *South Carolina, *Flood damage, *Culverts, *Compensation, Highways, Rainfall, Cloudbursts, Legal aspects, State governments, Condemnation, Eminent domain, Judicial decisions, Adjudication procedure, Drains, Drainage effects, Flooding, Floods, Administrative agencies, Storm runoff, Water injury, Highway effects, Highway relocation, Road construction, Roadbanks, Remedies.

Plaintiff water company brought an action for damages against defendant state highway department for flood damage caused by the inability of a culvert, built by defendant, to carry off rain water. Plaintiff contended that the culvert was negligently constructed in the first place, and after one flooding, plaintiff had warned defendant that further flooding was imminent. Plaintiff argued that the failure to enlarge the culvert was a taking of property for public use. Defendant contended that the matter was res judicata since plaintiff had already brought an action for the negligent construction of the culvert which action resulted in a verdict for defendant on the ground that the rainstorm was an unprecedented act of God. Reversing an order sustaining defendant's demmurer, the court held that there is no identity of causes of action when one action is brought for the creation of a nuisance and another is brought for the maintenance of a nuisance. The court reasoned that even if the first rainstorm was unprecedented in defendant's experience, plaintiff's subsequent warnings put defendant on notice and under a duty to maintain the culvert so as to prevent further damage to plaintiff's land. One justice dissented. (Liptak-Florida)
W70-09985

IN RE CAVANAUGH (CITY'S LIABILITY UNDER EMINENT DOMAIN FOR SUBSIDENCE DAMAGE CAUSED BY SEWER CONSTRUCTION).
183 A 360-363 (Pa Super Ct 1936).

Descriptors: *Pennsylvania, *Sewers, *Land subsidence, *Trenches, Condemnation, Eminent domain, Compensation, Adjudication procedure, Judicial decisions, Legal aspects, Cities, Local governments, Excavation, Damages, Settlement (Structural), Storm runoff, Washouts, Remedies, Drainage effects, Cloudbursts, Excessive precipitation.
Identifiers: Causation (Legal).

Plaintiff landowners sought damages for injury to their property caused by defendant city's sewer construction. Defendant had dug a trench adjoining plaintiffs' property and a rainstorm had filled the trench with water. This undermined plaintiffs' property, causing it to subside. Plaintiffs contended that the damage was a direct and unavoidable result of defendant's construction of the sewer. Defendant contended that the damage proceedings were improper because the rainstorm was an act of God and that, as a matter of law, defendant should not be liable unless negligence was shown. Affirming the dismissal of defendant's appeal, the court held that although the question of the propriety of the proceedings was for the court, the question of proximate cause was properly for the jury's determination. Thus, it was proper for the trial court, in reviewing the referee's findings, to determine whether the damage was the necessary result of digging the trench or an act of God. (Liptak-Florida)

PARKS V BENNING (LEASE OF OYSTER BEDS).

188 A 787-790 (Md 1937).

Descriptors: *Maryland, *Oysters, *Leases, *Beds under water, Beds, Ownership of beds, River beds, Governments, Legislation, Relative rights, Land tenure, Riparian land, Rent, Remedies, Judicial decisions, Legal aspects, Water law, Local governments, Third party effects, Shellfish, Commercial shellfish.

Plaintiff riparian landowner sought an injunction against defendant's lease of an oyster bed. A Maryland statute provided for such leases, but only to bona fide residents of the state. Plaintiff claimed that defendant was merely a 'straw man' and that another party, not a resident, was to be the beneficiary of the lease. Defendant argued that his part-time employment by the third party had no relation to the lease of the bed and the fact that the third party, on whose land the beds fronted, had paid the first year's rent was merely coincident with their acquaintance. The trial court enjoin the lease but the Court of Appeals of Maryla reversed, saying that the friendship between t nonresident riparian landowner and the lessee of oyster bed in front of his land did not violate t law which preserved such leases to residents on (Barker-Florida)

STAMFORD DOCK AND REALTY CORP CITY OF STAMFORD (CITY'S LIABILITY FO SEDIMENT DISCHARGE FROM STOR DRAINS AND SEWERS).
124 Conn 341, 200 A 343-346 (1938).

Descriptors: *Connecticut, *Sewers, *Navigatio *Sediment discharge, Local governments, Stor runoff, Drains, Drainage effects, Silts, Sediment Water pollution, Navigable water, Transportatio Cities, Legal aspects, Adjudication procedure, J dicial decisions, Public rights, Municipal waste Canals, River basins, Damages, Compensatio Silting, Remedies.
Identifiers: Governmental immunity.

Plaintiff shipping company sought to enjoin defer dant city from maintaining its storm drains an sewers so as to allow silt and other refuse t discharge into the navigable basin where plainti carried on its business, thereby causing the basin t fill up with sediment and be unfit for navigatio Plaintiff contended that the obstruction of th basin was a public and private nuisance which de fendant should be required to correct. Defendan argued that the maintenance of the storm drain and sewers was a governmental function, that it wa immune to liability for negligence, and that the sil and other refuse were results of acts of God. Af firming a judgment for defendant, the court hel that it could not be said as a matter of law that th damage to plaintiff's property and business was no caused by an act of God. Moreover, governmenta immunity was a good defense against a claim o negligence whether or not the negligence resulte in a nuisance. (Liptak-Florida)
W70-09988

COMMONWEALTH EX REL BARD V DELAWARE DIVISION CANAL CO (RESTRIC TIONS ON CANAL COMPANY'S USE OF PRO PERTY ARE NOT CONDITIONS OF TITLE).

332 Pa 53, 1 A2d 672-677 (1938).

Descriptors: *Pennsylvania, *Canals, *Land tenure, *Navigation, Competing uses, Industrial use (Water), Legislation, State governments, Adjudication procedure, Judicial decisions, Legal aspects, Water law, Water rights, Public rights, Transportation, Real property, Water quality, Highways, Navigable waters, Reasonable use, Consumptive use.

Plaintiff state of Pennsylvania sued defendant canal company for a decree of forfeiture revesting in the state title to land previously conveyed to defendant for use as a canal. Plaintiff contended that the terms of the conveyance limited use of the land to canal purposes and imposed a condition upon the title which should cause a forfeiture. Defendant had discontinued using the property for canal purposes. Plaintiff argued alternatively that the restrictive terms of the deed should be taken as covenants, and defendant should be required to restore the canal to navigable capacity. Defendant contended that mere declarations of purpose do not impose conditions upon title and that later legislation specifically authorized canal companies to use their water supply for other commercial purposes. Affirming a decree in favor of defendant, the court held that attempted restrictions on titles are strictly construed in favor of free alienation and that conditions on titles must be clearly stated. The court further noted that the terms of the deed referred to defendant's status as a common carrier, and defendant was no longer engaged in that business. In

ght of specific enabling legislation, defendant was ithin its rights to make other uses of its water upply so long as defendant did not pollute the aters or otherwise maintain the water supply so as create a nuisance. (Liptak-Florida)

ILGRIM PLYWOOD CORP V MELENDY (LIA-ILITY FOR OBSTRUCTION OF ACCESS OAD CAUSED BY DAM BACKWATER).
A2d 700-703 (Vt 1938).

escriptors: *Vermont, *Access routes, *Dams, Backwater, Lumbering, Roads, Condemnation, ublic utilities, Adjudication procedure, Judicial ecisions, Legal aspects, Public rights, Water law, emedies, Flood damage, Local governments, nited States, Cities, Eminent domain, Real pro-erty, Hydroelectric plants, Streams, Highway relo-ation, Damsites.
entifiers: Injunction.

aintiff lumber company sued defendant board of ublic works to enjoin the closing of a dam which ould cause flooding of the only road leading to aintiff's timber land. Plaintiff contended that no roceedings had been instituted to acquire the right flood the public highway, that the only land itable for an alternate access route to plaintiff's roperty had been acquired by defendant under the ate's eminent domain powers, and that defendant ad represented that an alternate access route ould be provided. Defendant contended that aintiff failed to establish that the flooding was an egal act as to plaintiff and that there was an lequate remedy at law since plaintiff could peti-on the town to provide an access road to the pro-erty. Reversing a decree in defendant's favor, the ourt noted that the obstruction or destruction of a ublic road could be enjoined as a nuisance if aintiff could show some special injury and held at cutting off plaintiff's only means of ingress and ress from his property was such a special injury. he court also noted that the remedy at law was in-lequate since plaintiff would be required to pay a bstantial portion of the cost of a road obtained by tition. However, the court held that injunctive lief should be delayed to give defendant reasona-e opportunity to acquire, if possible, the right to od the road. (Liptak-Florida)

ORTON V BOROUGH OF DORMONT (CI-Y'S LIABILITY FOR DAMAGE CAUSED BY CREASE IN NATURAL FLOW OF SURFACE ATER).

A2d 803-804 (Pa 1939).

escriptors: *Pennsylvania, *Sewers, *Drainage ater, *Riddance (Legal aspects), Eminent main, Damages, Remedies, Compensation, ocal governments, Cities, Legal aspects, Judicial cisions, Water law, Adjudication procedure, Sur-ce waters, Surface runoff, Flood damage, Water jury, Surface drainage, Storm drains, Natural reams, Artificial watercourses, Drainage effects.

aintiff property owner brought an action for mages against defendant city. The claim arose om water damage to plaintiff's farm caused by de-ndant's construction of storm sewers which in-eased the natural flow of surface water across aintiff's land. Plaintiff contended that a city ould be liable for artificial improvements which llect surface water and discharge it onto servient nd with such force as to cause flood damage. De-ndant contended that there was no compensable jury to plaintiff since the sewers were constructed rsuant to the city's lawful authority. On plain-f's appeal from a nonsuit, the court noted that a y could not be held liable for improvements hich merely increased the flow of surface water in natural watercourse. However, the city would be ble if the increased flow were discharged at some int on the servient land where the water would t have been naturally discharged. Therefore, the court reversed the judgment of nonsuit and remanded the case to determine whether the damage to palintiff's land fell within the rule of liability. (Liptak-Florida)

GRAF V CITY OF NEWARK (CANAL COMPANY'S AUTHORITY NOT LIMITED TO NAVIGATION WHEN CONSIDERING CONDITIONAL TITLE).
124 NJL 312, 11 A2d 764-766 (1940).

Descriptors: *New Jersey, *Canals, *Land use, *Land tenure, Cities, Legislation, Judicial decisions, Real property, Highways, Transportation, Navigation, Condemnation, Eminent domain, Compensation, Local governments, Legal aspects, State governments, Public rights.

Plaintiff's ancestor conveyed land to a canal company. The land was to be used pursuant to the canal company's statutory authority. Defendant city acquired the property after the canal company had abandoned the canal, and the city used the property for a public road. Plaintiff sued defendant for damages for taking of the property and contended that the land should have reverted when it was no longer used for navigation. Although the canal company's charter limited its powers to canal purposes, the court held that the canal was a public highway and its use was not limited to transportation by water. The court also noted that legislation authorizing cities to acquire the canal property was tantamount to an amendment of the company's charter, and the state's abandonment of the canal did not presume a relinquishment of the state's rights in the property. WEBBER V POLICE JURY (TITLE TO LAND IN ABANDONED DRAINAGE DISTRICT).
48 F Supp 350-357 (WD La 1943).

Descriptors: *Louisiana, *Drainage districts, *Land tenure, *Canals, Real property, Land, Land use, Administrative agencies, Levees, Drainage, Governments, Public lands, Public rights, Ditches, Administrative decisions, Flood control, Economics, Local governments, Remedies, Judicial decisions, Legal aspects.

Plaintiffs, owners of lands encompassed by a previously abandoned drainage sub-district, sought to have title to a canal and levee on one boundary of the property declared to be in them. Plaintiffs claimed that the title had been transferred by the board of commissioners of the parent drainage district when the smaller project was abandoned. Defendant police jury argued that no such transfer was made and that the original grants of the land in question reserved such land for public use. The United States District Court for the Western District of Louisiana ruled that the parent drainage district had expressly not conveyed the entire canal or the levee to palintiffs and that defendants acted properly in treating the land as publicly owned. Plaintiffs' suit was dismissed. (Barker-Florida)

UNITED STATES V CERTAIN LANDS IN TOWN OF HIGHLANDS (FEDERAL GOVERNMENT'S CONDEMNATION OF LAND CONSTITUTING A LOCAL WATERSHED).
48 F Supp 306-308 (SD NY 1942).

Descriptors: *Condemnation, *Watersheds (Divides), *Federal government, *Water supply, Watershed management, New York, Eminent domain, United States, Governments, Water law, Legal aspects, Legislation, Water rights, Cities, Judicial decisions, Land use, Local governments, Public utilities.

The United States sought to condemn and acquire certain land to be used for expansion of the West Point military reservation. The expansion was pursuant to an act of Congress which provided that nothing in the act should be taken to adversely affect the water supply of a nearby town. The town's only water company intervened in the condemnation proceedings and contended that, although it owned none of the property to be condemned, the property was a large part of the watershed and supplied a large part of the company's and the town's water supply. The company argued that the act's proviso prohibited a taking of such land. The Secretary of War expressly disclaimed any intent to acquire any of the company's rights, title, or interest in any of the land. The court held that the Secretary's disclaimer gave the water company all the protection it needed. The court reasoned that Congress intended to protect the town's water supply and that it could be be assumed that the Army's presence would adversely affect the watershed any more so than that of the present owners. (Liptak-Florida)
W70-09994

GULF OIL CORP V THE BALTIMORE (DREDGE COMPANY'S LIABILITY FOR OBSTRUCTION OF NAVIGABLE CHANNEL).
47 F Supp 770-773 (ED NY 1942).

Descriptors: *New York State Barge Canal, *Navigation, *Channel improvement, *Boulders, New York, Adjudication procedure, Excavation, Channels, Open channels, Navigable waters, Admiralty, Ships, Dredging, Legal aspects, Judicial decisions, Water law.

Plaintiff oil company sued defendant dredge company in admiralty for damages to plaintiff's ship. The ship had collided with a rock left by defendant's dredging operations in the New York State Barge Canal. Plaintiff contended that defendant had a duty, under its contract with the state, to sweep the channel after dredging operations to locate and correct any obstructions to navigation. Defendant contended that the rock might have fallen from the bank and not been dislodged by defendant's dredging operation. Defendant argued further that plaintiff was negligent in not navigating the center of the old channel. The court held that, once plaintiff had shown sufficient facts to make out a case, the burden was on defendant to explain the obstruction in an area which defendant had a duty to keep open for navigation. The court also noted that plaintiff's failure to use the center of the old channel was not negligence since the purpose of dredging and widening the canal was to make it safe for passage at points other than the old center. (Liptak-Florida)
W70-09995

GALLERANI V UNITED STATES (DAMAGE TO WELL FROM CANAL IMPROVEMENT).
41 F Supp 293-294 (D Mass 1941).

Descriptors: *United States, *Massachusetts, *Damages, *Percolating water, Subsurface water, Wells, Canals, Navigation, Legislation, Land tenure, Remedies, Judicial decisions, Legal aspects, Governments, Drawdown, Eminent domain, Compensation, Relative rights.
Identifiers: *Cape Cod Canal.

Plaintiff landowner brought suit against the United States for an alleged 'taking' of his property. The United States had appropriated land adjacent to plaintiff's property for the purpose of improving the Cape Code Canal, and subsequent to the improvement operations, a well on plaintiff's land dried up. The United States District Court for Massachusetts ruled that the taking of the adjacent land was a proper purpose, that there was no property right in the underground percolating waters, and that any injury resulting from the loss of such water through the lawful acts of an adjoining landowner must be considered damnum absque injuria. The United States' motion to dismiss was granted. (Barker-Florida)
W70-09996

OAKLAND CLUB V SOUTH CAROLINA PUBLIC SERVICE AUTH (SUIT TO ENJOIN CONDEMNATION OF PROPERTY FOR A DAMSITE).

30 F Supp 334-341 (ED SC 1939).

Descriptors: *South Carolina, *Condemnation, *Legislation, *Damsites, Remedies, Dams, Hydroelectric plants, Payment, Costs, Federal Power Act, Administrative agencies, Eminent domain, Land tenure, Legal aspects, Project purposes, Reservoirs, Judicial decisions, Damages, Permits, Federal project policy, Compensation, Reservoirs, Reservoir construction, Adjudication procedure.
Identifiers: *Constitutionality, Injunction.

Plaintiff sought to enjoin the defendant public service authority from condemning plaintiff's land for a damsite. As the defendant was acting under authority of both a state statute and the Federal Power Act, plaintiff claimed that the Federal statute pre-empted defendant's condemnation powers under state law. Both this claim and defendant's argument that the state statute was unconstitutional, in not setting up a proper method of payment, were rejected by the court. The court upheld the state law, which provided for compensation to be initially fixed by a panel of referees with the condemnee having a right of a de novo jury trial if he were dissatisfied with the award. The plaintiff also argued that the federal statute only provided for condemnation of 'damsites', which could not include land to be covered by the reservoir backed up by the dam. The court rejected this argument also, holding that the common usage of the term 'damsite' included the resulting reservoir. (Caldwell-Florida)
W70-09997

UNITED STATES EX REL TVA V VOGLE (UNITED STATES' CONDEMNATION OF MINERALS FOR TVA PURPOSES).

28 F Supp 454-455 (WD Ky 1939).

Descriptors: *Tennessee Valley Authority Project, *Condemnation, *Damsites, *Eminent domain, Land use, Federal government, Federal project policy, Legal aspects, Judicial decisions, Mining, Quarries, Dams, Dam construction, Concrete dams, Reservoirs, United States, Legislation, Adjudication procedure, Limestones, Public rights, Public utilities, Land tenure, Compensation.

The United States petitioned to condemn respondent's property for use by the Tennessee Valley Authority. Respondent contested the authority to condemn that part of his property which would not be flooded by the proposed reservoir but would be used to mine limestone rock for construction of the dam. Respondent contended that property not needed directly for the dam was not necessary and could not be condemned. The court held that it could pass only on what constituted a public taking and that the question of the necessity of a particular taking was for the legislature. Therefore, the court was without power to review the government's decision that this property was necessary for the purposes of the Tennessee Valley Authority. (Liptak-Florida)
W70-09998

UNITED STATES V 80 ACRES OF LAND (AUTHORITY FOR CONDEMNATION).
26 F Supp 315-322 (ED Ill 1939).

Descriptors: *United States, *Eminent domain, *Multiple-purpose projects, *Condemnation, Legislation, Governments, Soil converation, Water conservation, Erosion control, Forest management, Project purposes, Forestry, Water pollution control, Flood control, Federal project policy, Public benefits, Administration, Administrative agencies, Economic impact, Compensation, Remedies, Judicial decisions, Legal aspects, Social aspects.
Identifiers: *Constitutionality

In a condemnation proceeding the United States sought to acquire defendants' land which lay within the area to be affected by a project under the National Industrial Recovery Act. Defendants moved to dismiss on the grounds that the statutes were unconstitutional and that the proposed project was not properly within the definition of the public purpose doctrine. The United States District Court, Eastern District of Illinois, found that the project was designed for the purposes of conservation, pollution control, forestation, flood control, and unemployment relief, and was therefore clearly within the scope of public purpose. The court further ruled that the statute was constitutional. The motion to dismiss was denied. (Barker-Florida)
W70-09999

FRANKLIN V UNITED STATES (CONSEQUENTIAL DAMAGES FROM NAVIGATION IMPROVEMENT).

16 F Supp 253-260 (WD Tenn 1936).

Descriptors: *United States, *Mississippi River, *Alteration of flow, *Navigation, Tennessee, Navigable rivers, Projects, Legislation, Structures, Dikes, Obstruction to flow, Riparian rights, Riparian land, Damages, Flood damage, Relative rights, Governments, Channels, Eminent domain, Remedies, Judicial decisions, Legal aspects.

Plaintiffs sought recovery for damages caused their lands by flooding which was the result of a navigational improvement project on the Mississippi River. Defendant United States had erected dikes in the river upstream and across from plaintiffs' lands and had thereby changed the channel so that it was forced against the lands. Plaintiffs argued that the resulting flooding of their property was a taking within the meaning of the fifth amendment. Citing a long line of cases concerning governmental liability for navigation projects, the United States District Court for the Western District of Tennessee ruled that the damages to plaintiffs' lands were consequential, thus relieving the United States from liability. The court accepted the principle that riparian ownership on navigable waters is subject to the obligation to suffer the consequences of an improvement of the navigation by the United States. (Barker-Florida)

STATE V ADELMEYER (STATE'S RIGHT TO FLOW RIPARIAN LAND).
265 NW 838-848 (Wis 1936).

Descriptors: *Navigable waters, *Wisconsin, *Riparian rights, *Compensation, Judicial decisions, Legal aspects, Legislation, Eminent domain, Condemnation, Flow, Natural flow, Riverflow, Dams, Marshes, Land, Arable land, Land forming, Land use, Rivers, Governments, State governments, Riparian land, Flooding, Obstruction to flow, Reclamation, Alteration of flow.

Property owned by defendants comprised what once was a marsh. Defendants privately and individually constructed facilities which changed the course of a river, thus transforming the marsh into usable farmland. Twenty years after this transformation plaintiff state dammed the river, which again created a marsh, for the purpose of establishing a wildlife sanctuary. No compensation was made to landowners whose land was again inundated. Plaintiff sought a declaratory judgment to determine the rights of all parties in the marsh. Plaintiff contended that defendants had no right to change the course of a navigable river. Defendants answered that the state's acquiescence in the change estopped it from complaining or returning the river to its natural course without compensating defendants. The Supreme Court of Wisconsin ruled for defendants. The court found that the landowners' action had increased the navigability of the river and that the uncovered lands had taken on a new value and character. Consequently, the state could not flow such lands, despite the fact that the lands were naturally marsh, without compensating the owners. The measure of compensation was stated to be the difference between the values of the inundated and uninundated lands. (Dye-Florida)

NELSON V DE LONG (DEPRIVATION OF RIPARIAN RIGHTS APPURTENANT TO ALKESHORE PROPERTY).
7 NW2d 342-350 (Minn 1942).

Descriptors: *Minnesota, *Cities, *Lakes, *Regulation, Docks, Real property, Riparian rights, Riparian land, Judicial decisions, Legal aspects, Shores, Navigable waters, Easements, Condemnation, Recreation, Boats, Boating, Boating regulations, Permits, Local governments, Legislation, Navigation, Public rights, State governments, Supervisory control (Power).

Plaintiff, though not a riparian landowner, had been conveyed certain riparian rights which allowed the use of docks, boathouses and the shorefront of a lake. Due to increased usage of the shorefront by plaintiff and others, defendant village mayor undertook to regulate the use of the shores and the adjacent waters by having the city pass an ordinance which prohibited construction of boathouses and other structures. Plaintiff brought action for relief from this ordinance, alleging that such action was an arbitrary exercise of the defendant's power in denial of plaintiff's riparian rights. On appeal from a verdict for defendant, the court held that a riparian owner's rights are qualified, restricted and subordinate to the paramount rights of the public. The exercise of the state's public rights does not deprive the riparian owner of any right, but merely regulates and limits the exercise of existing rights. The state's soverign right to regulate may lawfully be delegated to a municipal corporation. Thus all regulation by defendant was found to be a lawful exercise of the village's governmental power. (Barnett-Florida)

STATE EX REL PRIEGEL V NORTHERN STATES POWER CO (ENJOINING DAM OPERATION AS A PUBLIC NUISANCE).
242 Wis 345, 8 NW2d 350-354 (1943).

Descriptors: *Wisconsin, *Dams, *Power head, *Fishkill, Fish management, State governments, Rivers, Diversion, Canals, Tailwater, Floodgates, Fishing, Streams, Administration, Administrative agencies, Navigable waters, Judicial decisions, Legal aspects, Legislation, Riparian rights, Natural flow, Powerplants, Impounded waters, Regulation, Public rights.
Identifiers: *Injunctions (Prohibitory).

Water from a river was diverted by defendant's dam through its power house. The water was then discharged into a storage pond. In time of flood, defendant opened the floodgates of its dam to allow excessive water to flow into the original river bed. When the gates were closed, fish were occasionally trapped in pools below the dam and were taken illegally or died from exposure. Plaintiff game warden brought action to enjoin the dam's operation as a public nuisance, alleging that the river was navigable, that the public had a right to fish and navigate thereon, and that said dam cut off the public rights in the river and restricted the flow of water in violation of state statute. Defendant answered that the Public Service Commission had conducted a hearing and had determined that the fish loss was insignificant in light of the cost of eliminating the loss. The court found that the state statute regulating the flow of water in the case of dams in navigable streams did not apply where the water was discharged directly into a storage pond. The loss of fish caused by the operation of the dam and the de minimis diversion was insignificant and could not justify the arbitrary enjoining of such operation and diversion as a nuisance. (Barnett-Florida)

OFFMASTER V TAGGART (PUBLIC RIGHT O FISH IN NAVIGABLE WATERS).

06 Mich 432, 11 NW2d 193-197 (1943).

escriptors: *Michigan, *Navigable rivers, *Fish-g, *Public rights, Fish conservation, Fish ocking, Dams, Trout, Judicial decisions, Legal spects, Meanders, Streams, Riparian rights, eneficial use, Riarian land, Ownership of beds, elative rights, Recreation, State governments, avigable waters, Real property, Proprietary ower, Land tenure.

efendants claimed that a stream that crossed their nd was non-navigable and thus not open to public shing. They excavated the channel of the stream here it entered and left their property for the pur-ose of making it impossible for fishermen to enter wading. Plaintiff brought action as a private tizen alleging that the stream was navigable and, eing navigable, was subject to the public's right to ke fish therefrom. Defendant contended that they ad done nothing to impede navigation and that in ny event they had the right to prevent trespasses n their property. The Supreme Court of Michigan, eversing the lower court, held that a stream which ould not be used for boating but had been used for oating logs, and in which the public had been fish-g for 50 years and on which the state had ex-ended large sums of money to stock it with fish as a navigable stream, and riparian owners could ot exclude the public from fishing therein. (Bar-ett-Florida)

OARD OF TRUSTEES V BOARD OF UPR'VSRS (COMPULSORY CONTRIBUTION Y DRAINAGE DISTRICTS FOR MAIN-ENANCE OF COMMON FACILITIES).

9 NW2d 196-201 (Iowa 1945).

escriptors: *Cost sharing, *Drainage districts, Drainage systems, *Iowa, Administrative agen-es, Administration, Judicial decisions, Legal spects, Administrative decisions, Costs, Public enefits, Assessments, Ditches, Outlets, Laterals, qualizing reservoirs, Rivers, Missouri River, Drains, Dikes, Regulation, Operation and maintenance, Financing, Cost allocation.

Plaintiff drainage district's main ditch extended north and south approximately 21 miles. Defendant districts was situated north of plaintiff. Plaintiff contended said districts were outleting their drainage into its main ditch. Plaintiff had certain repairs and maintenance operations performed in its district which were necessary to carry off the combined waters of the various districts. Plaintiff brought suit to compel the upper districts to levy assessments to pay their share of the expense of maintaining the alleged common outlet. Defendants contended that their districts did not outlet into plaintiff's ditch, but rather that they discharged their drainage into nearby natural streams. The lower court held for plaintiff, finding that defendants did in fact outlet into plaintiff's ditch. The Supreme Court of Iowa affirmed, stating that defendants' natural stream outlets did not furnish satisfactory outlets. Moreover, it held that since plaintiff's ditch provided defendants with a deeper and more adequate outlet to discharge their drainage water into, defendants could be compelled to make assessments for the maintenance thereof. HICKS V ANDERSON (LANDOWNER'S RIGHT TO HAVE PROPERTY CONDEMNED AFTER DAMAGE RESULTS FROM STATE ACTION).
182 Va 195, 28 SE2d 629-630 (1944).

Descriptors: *Virginia, *Condemnation, *Flooding, *Administrative agencies, Judicial decisions, Flow, Administration, Legal aspects, Governments, State governments, Eminent domain, Surface runoff, Highways, Roads, Highway relocation, Road construction, Culverts, Surface drainage, Rain, Erosion, Arable land, Land, Damages, Flood damage, Rain water, Remedies.

Plaintiff landowner sought a writ of mandamus to compel defendant State Highway Commissioner to institute condemnation proceedings on plaintiff's property which was injured by floodwaters. Plaintiff contended that the damage resulted from construction of a state road which diverted water onto his land. Defendant contended that the damage resulted from the natural flow of surface water over plaintiff's property. The Supreme Court of Appeals of Virginia held for plaintiff and issued the writ. One of whose property is damaged as a result of highway construction may not sue the commonwealth; his only remedy is through condemnation. A landowner is entitled to compensation for property damage resulting from flowage diverted onto his land by a public highway. (Dye-Florida)

ADAMS V CAREY (DAMAGE TO OYSTER BEDS CAUSED BY FERRYBOAT RUNNING AGROUND).
190 A 815-822 (Md 1937).

Descriptors: *Maryland, *Boats, *Oysters, *Damages, Beds, Navigation, Fog, Channels, Harbors, Navigable waters, Ships, Ownership of beds, Beds under water, Riparian rights, Permits, Legal aspects, Judicial decisions, Relative rights, Remedies, Commercial shellfish, Shellfish, Mollusks.

In a fog defendant's ferryboat ran aground on a shoal and, in an attempt to free itself, damaged plaintiff's oyster beds. The appellate court felt that there was no negligence in attempting to navigate the vessel during the fog, as the ferryboat had a responsibility to get its passengers across the channel regardless of the weather. However, the jury had found that the ferryboat operator did not use reasonable care in his efforts to free the boat from the shoal, which efforts damaged the beds and covered many oysters with sand, and the court declined to disturb this finding. The lower court decision was reversed, however, because of the lower court's failure to give instructions on the effect of defendant's paramount right of navigation, and failure to require the jury to find whether defendant knew or should have known that his actions in freeing the boat would damage the beds. Plaintiff's property rights in the oyster bed were held to be subject to ordinary dangers incident to navigation. Therefore, the fact that the beds were damaged by defendant's ferryboat did not of itself give rise to damages. (Caldwell-Florida)
W70-10008

CONWAY V NEW HAMPSHIRE WATER RES BD (CONSTITUTIONALITY OF LEGISLATION SETTING UP A WATER RESOURCE DEVELOPMENT PROGRAM).
199 A 83-90 (NH 1938).

Descriptors: *New Hampshire, *Legislation, *Administrative agencies, *Water resources development, Project purposes, Public benefits, Hydroelectric power, Flood control, Water storage, Project benefits, Governments, Taxes, Legal aspects, Remedies, Judicial decisions, Water utilization, Hydroelectric project licensing, Costs, Multiple-purpose projects.
Identifiers: *Constitutionality.

Petitioners brought a taxpayers' suit to enjoin expenditure of state funds for a water resource development program. Petitioners claimed that the legislation setting up the program was unconstitutional in that the projects were not for a public purpose. The court rejected the claim, holding that the program did involve a public purpose. Development of hydroelectric power and flood control were specifically pointed to as examples of benefits accruing to the public. The court held that the planned private use of the power, developed from storing water and employed in producing electric energy, was not a forbidden aid to private industry because the private benefits were merely incidental to the public purposes involved. No elements of a commercial enterprise were found in the program, and sufficient standards were laid down by the statute to guide the defendant board in the implementation of the program. (Caldwell-Florida)
W70-10009

MAYOR AND CITY COUNCIL OF HAVRE DE GRACE V MAXA (CITY'S LIABILITY FOR DAMAGES TO RIPARIAN OWNER CAUSED BY NEGLIGENT CONSTRUCTION OF RETAINING WALL).

9 A2d 235-243 (Md 1939).

Descriptors: *Maryland, *Excavation, *Retaining walls, *Riparian rights, Bays, Judicial decisions, Legal aspects, Local governments, Cities, Riparian land, Riparian waters, Water rights, Bulkheads, Concrete piles, Landfills, Land forming, Marinas, Easements, Access routes, Compensation, Value, Real property, Property values, Project planning, Planning.

Plaintiff riparian owner brought action against defendant city to recover damages for injuries sustained when dredged material deposited behind a retaining wall erected by the city in constructing a yacht basin escaped and became deposited along the shore adjoining plaintiff's property, thereby depriving plaintiff of his access to the bay. Plaintiff's evidence showed that the retaining wall was obviously insufficient and that defendant had been warned by its employees that damages to riparian owners were probable. Plaintiff contended that such evidence established defendant's negligence and liability. Defendant contended that it was not liable for the negligence of its subcontractors and that it was immune to liability since it was a municipal corporation engaged in a governmental function. Affirming a judgment for plaintiff, the court held that the subcontractor was only bound to perform according to his contract whereas defendant had a duty to plan the project so that riparian owners would be protected. The court further

held that governmental immunity did not apply to defendant where there was evidence of specific negligent acts. The court also noted that the proper measure of damages was the difference between fair market value before and after the injury, including any damage to plaintiff's personal enjoyment and use of the property. (Liptak-Florida)

UNITED STATES V 2.02 ACRES OF LAND (CONDEMNATION OF WATERFRONT PROPERTY).
51 F Supp 56-61 (SD NY 1943).

Descriptors: *New York, *Land tenure, *Condemnation value, *Eminent domain, Condemnation, United States, Governments, Landfills, Public lands, Cities, Parks, Land use, Military reservations, Military aspects, Grants, Judicial decisions, Legal aspects, Sea walls, State governments, Local governments, Federal government, Compensation.

In a condemnation proceeding the United States sought valuation of certain waterfront lands owned by a city and a county. The state of New York sought to take part in the award on the grounds that the original grant whereby the underwater land was conveyed contained a reverter provision which would become operative if the land were not filled and used for public park purposes. New York claimed that the taking suspended the public use and that title thereby reverted to the state. The United States District Court for the Southern District of New York ruled that the conditions of the grants were not violated when the federal government first leased and then later condemned the lands. Title was held to be in the city and county and the full award was given to them alone. (Barker-Florida)
W70-10011

WILLIS V UNITED STATES (COMPENSATION FOR FLOODING OF RIPARIAN LAND CAUSED BY FEDERAL DAM CONSTRUCTION).
50 F Supp 99-102 (SD W Va 1943).

Descriptors: *United States, *West Virginia, *Dam construction, *Eminent domain, Dams, Damsites, Damages, Flooding, Reservoirs, Navigable rivers, High-water mark, Riparian land, Erosion, Riparian rights, Banks, Boundaries (Property), Water level fluctuations, Compensation, Economic impact, Value, Governments, Remedies, Judicial decisions, Legal aspects, Legislation.
Identifiers: *Tucker Act, *Cribbing.

Plaintiff riparian landowner sought to recover for lands flooded as a result of defendant United States' construction of a dam below his property. Plaintiff contended that the dam construction had raised the water level of the river abutting his property above the ordinary high-water mark and that recovery was authorized by the Tucker Act. Plaintiff further claimed damage to cribbing placed at the old river edge to prevent erosion. The United States claimed that the reservoir level was not above the ordinary high-water mark and that the cribbing had become useless and thus had no value. The United States District Court, Southern District of West Virginia, ruled that the government had raised the water level above the ordinary high-water mark thus flooding plaintiff's land, and that the inundated cribbing was functional. An award for the flooded land taken and the damage to the cribbing was granted to the plaintiff. (Barker-Florida)
W70-10012

GRANT V TENNESSEE VALLEY AUTHORITY (IMMUNITY OF GOVERNMENTAL AGENCY FROM SUIT).

49 F Supp 564-567 (ED Tenn 1942).

Descriptors: *Tennessee, *United States, *Tennessee Valley Authority Project, *Damages, Navigation, Navigable rivers, Tennessee River, Dams, Damsites, Multiple-purpose projects, Project planning, Legislation, Governments, Hydroelectric power, Hydroelectric plants, Project purposes, Flooding, Crops, Benefits, Remedies, Judicial decisions, Legal aspects, Political aspects, Direct benefits, Project benefits.
Identifiers: *Immunity (Governments).

Plaintiff landowner sued the Tennessee Valley Authority for alleged negligence in its operations, by which plaintiff's crops were damaged. Defendant, in a motion for summary judgment for failure to present justiciable facts, claimed immunity from the suit. The United States District Court for the Eastern District of Tennessee ruled that if damage did occur to plaintiff, it stemmed from the government's power over navigation, and that the government is only answerable in damages when it engages in activities as a private citizen. The court further held that defendant was merely an agent of the federal government and thus enjoyed the same immunity from suit. The motion for summary judgment was granted. As dicta, the court noted that plaintiff had actually been benefited by defendant's operations, since without the project's existence, the flood damage would have been greater than it was. (Barker-Florida)
W70-10013

RICHARD V KAUFMAN (DAMAGE TO SPRING CAUSED BY BLASTING OPERATIONS).

47 F Supp 337-339 (Ed Penn 1942).

Descriptors: *Pennsylvania, *Explosions, *Adjudication procedure, *Springs, Explosives, Damages, Spring waters, Subsurface waters, Water sources, Excavation, Hazards, Deformation, Remedies, Judicial decisions, Legal aspects, Tunnel construction, Tunneling, Tunnels.

Plaintiff landowner brought an action to recover for damage to a spring allegedly caused by defendant's tunneling and blasting operations on adjacent property. Defendant construction company argued that the blasting was not the direct cause of the damage to the spring. The trial jury ruled in favor of plaintiff and the U. S. District Court for the Eastern District of Pennsylvania, affirmed, holding that the question as to whether the blasting operations caused the damage to the spring was properly submitted to the jury for determination. Moreover, testimony by two witnesses concerning the flow of the spring was properly admitted. (Barker-Florida)
W70-10014

MUTUAL CHEMICAL CO OF AMERICA V MAYOR AND CITY COUNCIL OF BALTIMORE (RELATIVE BULKHEAD--FILL RIGHTS).
33 F Supp 881-891 (D Md 1940).

Descriptors: *Maryland, *Cities, *Bulkhead line, *Relative rights, Riparian rights, Navigation, Piers, Landfills, Land forming, Airports, Runways, Administrative agencies, United States, Governments, Permits, Regulation, Planning, Banks, Riparian land, Ownership of beds, Remedies, Judicial decisions, Legal aspects, Land tenure, Contracts.

Plaintiff landowners brought suit to have the extent of their riparian ownership along a river established and to enjoin the City of Baltimore from encroaching on those rights. The bulkhead and pier lines in the river had been established by the United States government. The city sought and was granted a permit to fill to those lines in order to build an airport, and an agreement between the city and surrounding landowners was established whereby the relative riparian rights concerning the bulkhead lines were agreed upon. When the city later sought to expand the airport, a new plan, which expanded the city's rights, was proposed to the landowners. Plaintiff's who had acted substantially in reliance on the old plan, brought suit. The United States District Court of Maryland ruled that where the city had adopted a plan for apportioning the harbor line to owners of an irregular shore, a such plan fixed the city's riparian rights, the c could not thereafter adopt a new plan giving its additional riparian rights and curtailing the ripari rights of the other shore owners. The injunctio was granted. (Barker-Florida)

GOODMAN V UNITED STATES (DAMAG FROM GOVERNMENT'S NAVIGATION PRO JECT).
28 F Supp 497-504 (S D Iowa 1939).

Descriptors: *Iowa, *Missouri River, *Floo damage, *Eminent domain, United States, Gover ments, Navigable rivers, Navigation, Projects, Pr ject purposes, Water policy, Damages, Floodin Structures, Piles (Foundations), Diversion stru tures, Sedimentation, Sediment control, Legisl tion, Remedies, Crops, Riparian rights, Judici decisions, Legal aspects, High-water mark.
Identifiers: *Revetments, *Tucker Act.

Plaintiff riparian landowner on the Missouri Riv brought action to recover damages stemming fro a United States government project to improv navigation on the River. The United States ha erected pile dikes and revetments in the River an the resulting higher water level flooded plaintiff land destroying his crops. Plaintiff alleged suc damage was a taking under the fifth amendmer and sought recovery under the Tucker Act for case not sounding in tort. The United States Di trict Court for the Southern District of Iowa rule that, in such an action, recovery can be given onl where the government contemplated damage would result from its activity and an implied con tract can be found. The court further held tha plaintiff's damages were consequential and tempo rary, thus removing the case from the purview o the Tucker Act and making the United States im mune from the suit. (Barker-Florida)

HUMBOLDT LOVELOCK IRR LIGHT AND POWER CO V SMITH (STATE REGULATION OF RIVER WATER DIVERSION).

25 F Supp 571-575 (D Nev 1938).

Descriptors: *Nevada, *Adjudication procedure *Prior appropriation, *Administrative decisions Appropriation, Preferences (Water rights), Priorities, Water rights, Administrative agencies, State governments, Legal aspects, Judicial decisions, Reservoirs, Irrigation water, Hydroelectric power, Livestock, Water demand, Regulation, Intake gates, Diversion, Arid climates, Distribution, Supervisory control (Power).

Plaintiff corporation owned a reservoir constructed for the purpose of impounding surplus and unappropriated waters of the Humboldt River. Subsequent to impoundment the waters were used by the corporation's stockholders for irrigation, livestock and power purposes. Pursuant to his statutorily granted authority to regulate diversions from the Humboldt River, defendant state engineer closed the intake gates to plaintiff's reservoir system. Plaintiff sued, contending that the statutory procedures for such closing denied it due process. The United States District Court dismissed the case, holding that the statute in question did provide such full opportunity to be heard as would satisfy due process requirements. Moreover, the court noted that arid and semi-arid states, in the exercise of their police power, may regulate the manner of appropriation and distribution of water from natural streams for purposes of irrigation. (Marsee-Florida)

ADAMS-MCGILL CO V HENDRIX (OWNERSHIP OF SPRING).
22 F Supp 789-792 (D Nev 1938).

escriptors: *Nevada, *Springs, *Land tenure, Water rights, Boundaries (Property), Relative ghts, Legislation, Surveys, Water utilization, Con- acts, Legal aspects, Grazing, Real property, aims (Contracts).

on default by defendant purchaser on a land ntract, plaintiff vendor brought an action to cover the purchase price. The purchaser de- nded by alleging that a certain spring, the rights which were included in the contract, were not ned and could not be delivered by plaintiff. The urt held that, in light of the great value of spring hts in an arid land and the fact that the rights re protected by statute, such rights could be con- ered as real property. However, the contract tween plaintiff and defendant contained no war- nty clause, and the court found that the plaintiff d only contracted to deliver such rights to the ring as he possessed, which were none. Plaintiff s held to be entitled to recover. (Caldwell- rida)

NNESSEE ELECTRIC POWER CO V TVA ALIDITY OF FEDERAL PROJECTS UNDER IE TVA ACT OF 1933).
F Supp 947-961 (ED Tenn 1938).

scriptors: *Tennessee Valley Authority Project, am construction, *Public utilities, *Hydroelec- plants, Hydroelectric power, Remedies, gislation, Flood control, Project purposes, Legal ects, River basin development, Dams, Compet- uses, Judicial decisions, Administrative agen- s, Federal government, Cities, Electric power duction, Damages, Navigation, State govern- nts, Water storage, Multiple-purpose projects. ntifiers: *Constitutionality.

intiffs, private electric power companies, sought enjoin construction and operation of any TVA droelectric project. Plaintiffs in essence claimed t the TVA Act of 1933 and the acts performed the Authority were unconstitutional. In the irse of a comprehensive discussion of the ckground of the TVA program, the Federal Dis- ct Court found that the purposes of the dams in estion were electric power production, flood ntrol, and National Defense. The Act was held nstitutional under the national defense clause of Constitution and under the power of Congress control navigation under the Commerce clause. conspiracy, coercion, or unlawful competition, alleged by plaintiffs, were found to exist. Both existing and planned operations of the dams re found to be in compliance with the statute. e court held that since the United States had uired the sites and constructed the dams legally, energy produced therefrom was property be- ging to the United States. This property could legally sold just as any other government proper- The complaint was therefore dismissed. (Cald- ll-Florida)

HAGIE V LINCOLN LAND CO (CHARGE OF POINT OF DIVERSION FROM STREAM CLAIMED TO BE ABANDONMENT OF RIGHT TO DIVERT).
18 F Supp 637-641 (D Wyo 1937).

Descriptors: *Water rights, *Prior appropriation, *Wyoming, *Diversion, Priorities, Streams, Ditches, Alteration of flow, Dams, Water utilization, Irrigation, Competing uses, Relative rights, Legislation, Beneficial use, Water supply, Consumptive use, Preferences (Waterrights), Irrigation water, Groundwater movement, Percolation, Land use, Legal aspects, Adjudication procedure.

Defendant had previously established an appropriative right to divert water from the main channel of a stream. When defendant closed his original point of diversion and built a dam farther downstream on his property for irrigation purposes, plaintiff, a downstream landowner, claimed abandonment of defendants' right to divert. The court in holding for the defendant found that plaintiff could not maintain his suit because he could not show that he would be benefitted by a declaration of abandonment. Other intervening riparian owners had unfulfilled priorities which would more than take over any water which defendant would forfeit. The court further found that, even though the original diversion point had been closed, there had been no abandonment. Defendant had built a dam downstream, which caused water to percolate onto his fields, an unusual but effective means of irrigation. The complaint was therefore dismissed. (Caldwell-Florida)
W70-10021

HOLYOKE WATER POWER CO V AMERICAN WRITING PAPER CO (CONTRACT PROHIBITING POWER TRANSMISSION FROM LAND GRANTED).
17 F Supp 895-899 (D Mass 1936).

Descriptors: *Hydroelectric power, *Dams, *Contracts, *Canals, Mills, Water contracts, Electric power, Hydroelectric plants, Transmission (Electrical), Electric power production, Water utilization, Mill dams, Land tenure.

Complainant sought to enjoin respondent from transmitting elsewhere electric power produced on respondent's millsite. Complainant had granted respondent's predecessors in interest the millsite and the right to a certain amount of water power. A clause in the contract provided that the power produced on the millsite was to be used only on the land on which the mill was located, and complainant contended that this clause prohibited transmission of electric power generated on the site to other locations. The court rejected this contention. While stating that electricity was essentially an improved means for the transfer of power and not a separate commodity, the court held that the original limitation had only the purpose of assuring complainant a specified place to deliver the water, and did not prevent respondents from transmitting electric power. SUGGESTIONS FOR A MODEL FLOOD PLAIN ZONING ORDINANCE,
William Hines, J. W. Howe, and Dick Montgomery.
Land and Water Law Review, Vol. 5, p 321-350 (1970). 30 p, 66 ref, 1 append.

Descriptors: *Flood plain zoning, *Legislation, *Flood protection, *Land use, Regulation, Flood control, Flood damage, Flood plains, Rivers, Governments, Public benefits, Legal aspects, Political aspects, Economics, Obstruction to flow, Local governments, Zoning, Project purposes, Floodways, Planning, Data collections, Rational formula, Land classification, Building codes, Structures.

Despite the construction of extensive flood protection devices, annual flood losses have continued to rise. The author contends that flood plain regulations directed toward control of property and structures within flood plains are necessary to reduce flood damage. Such measures would be constitutional as necessary for the public welfare even though they restrict the use of property within the affected area. The model statute suggested by the author would classify the flood plain into three districts: floodways, flood plain districts, and upland districts. Floodways, the river channel and the area immediately adjoining the channel, would be subject to restrictions preventing any use which would obstruct the efficient carrying away of flood waters. The other two districts would be subject to respectively less stringent ristrictions. The delineation of district boundaries, based on the maximum probable flood, may be very difficult, and local authorities should avail themselves of data available from state and federal agencies. ECOLOGY-ITS PLACE IN WATER MANAGEMENT,
Michigan Univ., Ann Arbor. School of Natural Resources.
Stanley A. Cain.
In: Water Spectrum, Issues, Choices, Actions, Vol. 1, No. 1, Summer 1969, p 10-14. 1 photo.

Descriptors: *Ecology, *Environment, *Water management, Water resources, Natural resources, Environmental effects, Watershed management, Sequence.
Identifiers: *Interrelations, *Sequences of change.

The author discusses ecology and its place in the management of natural resources, specifically water resources. The ecological approach is concerned with interrelations among living things and their environment, sequences of change in an environment, and interconnections between one environmental site and another. This approach differs from the traditional cause-and-effect approach

which views elements separately. These ideas are related to water resources management with the stream seen as a creature of the watershed, the entire land surface that provides water drainage into the stream. A change in any part of the watershed may affect a sequence of interrelated changes in the rest of the watershed. Some examples are given where the ecological approach was not used and effects have been detrimental to man's ecology which, in effect, encompasses all ecology. Greater application of ecological foresight to management of water and other related natural resources can help us avoid disasters in the future and assure a more productive environment. ESTUARINE CONSERVATION LEGISLATION IN THE UNITED STATES,
Milton S. Heath, Jr.
Land and Water Law Review, Vol. 5, p 351-390 (1970). 40 p, 61 ref. 1 append.

Descriptors: *Conservation, *Legislation, *Estuarine environment, *Estuaries, Ecology, Wetlands, Water pollution, Aquatic habitats, Coasts, Preservation, Permits, Regulation, Marshes, Administrative agencies, Legal aspects, Judicial decisions, State jurisdiction, Programs, Dredging, Natural resources, Marsh management, Adoption of practices, Adjudication procedure, Florida, California.

Estuarine areas are being threatened by pollution and by physical alterations by man that reduce acreage of estuarine marshes and open waters. Presently, the only federal regulation of activities affecting these areas is the system of permits administered by the Army for projects affecting navigable waters. Several coastal states have legislative programs regulating dredging or filling, establishing bulkhead lines, and setting up zoning criteria. Some states also have provisions for acquiring estuarine areas for public use. Court decisions concerning the validity of state legislation restricting the use of estuarine property have been split. The author examines several state programs for estuarine conservation, including California and Florida. In addition to the provisions listed above, these legislative frameworks include fish and game regulation and use permits. The author presents a suggested state law for control of estuarine areas. This statute would include a broad permit system for any use of these areas and would provide for a comprehensive study of estuarine environment problems. (Caldwell-Florida)

Frederick E. Smith.
Bioscience, Vol 19, No 4, p 317-320, April 1969.

Descriptors: *Ecosystems, *Nutrient requirements, *Transpiration, Soil-water-plant relationships, *Productivity, Ecology, Arid lands, Tropical regions, Grasslands, Forests, Agriculture, Biomass, Aquatic plants, Aquatic productivity, Energy transfer, Erosion, Streamflow.
Identifiers: *Population ecology, *Temperate zones, *Protein production, *Calorie production, *Ecosystem alteration, Nutrient status.

Since we are accelerating ecosystem exploitations, we must recognize their limitations as well as potentialities. Predation increases protein production while plant consumption increases calorie production. An increase in the production of one leads to a decrease in the other. Since world protein deficiency is currently greater than calorie deficiency, grasslands should not be replaced by crops because this leads to a decline in animal protein production. Similar problems exist between water quality and water quantity. Forest ecosystems transpire high quality water and their destruction leads to greater runoff, but of lower quality water. In terrestrial plants 95-99 percent of all utilized solar radiation supports nutrient transport via the mechanism of transpiration. Arid lands suffer least in this respect because soil nutrients are more evenly dispersed with the consequence of many irrigation projects in these areas. However, all such irrigation projects have ultimately failed due to soil salt accumulation. In humid tropical areas, nutrients lie on the surface in low concentrations with consequent high transpiration rates. Agricultural potential is limited because the nutrients soon wash away after destruction of native vegetation. Man's most successful ecological alterations have been the conversions of forests to grasslands. (Casey-Arizona)

Identifiers: *Lineations, *Multispectral photog raphy, Apollo 9.

Four multispectral photographs of east centra Alabama were made by the crew of the Apollo spacecraft. The photographs cover a 6,400 squar mile area (about 80 x 80 miles square) betwee Birmingham, Alabama, and the Georgia Stat boundary. The most significant features observe on the photographs are the relatively straight lon lineations that intersect Appalachian structura axes. Because little or no offset in topographic fea tures is evident along most of the traces, the linea tions are thought to represent fractures. Apparen coincidence of the linear features with areas c known anomalies of streamflow, of large capacit wells and springs, quarry drainage, and dar leakage problems indicate that lineations may hav not only a marked geologic effect but also may b of great hydrologic, environmental, and economi significance. The interpretations made of th photographs indicate the following application (1) Determining areas of groundwater movemen (2) Determining areas where large quantities c groundwater are available; (3) Determining area for making low-flow measurements; (4) Determin ing areas for locations of gaging stations; (5) Loca ing sites of optimum hydrogeologic conditions fo the construction of dams and reservoirs; (6) As a aid in geologic mapping; and (7) As an aid in th study of structural geology of an area. escriptors: *Remote sensing, *Infrared radiation, eophysics, Monitoring, Water pollution sources, hermal pollution, Geology, Solar radiation, Heat ansfer.
dentifiers: Infrared scanners.

he key role of airborne infrared line-scan imaging stems in geophysical exploration and environ-ental control is to record temporal and spatial riations in broadband thermal emission from the rth's surface. Correlation of these variations with nvective heat flow anomalies, resistivity lows, ermal pollution, and occurrence of icroearthquakes is just beginning to pay vidends in volcanology, in exploration, in pollu-on monitoring, and development of geothermal ower sources. In planning precise airborne sur-eys of radiant flux from the earth's surface ac-unt must be taken of background noise created variations in micrometeorological factors and nissivity of surface materials, as well as the diur-l temperature cycle. The effect of the diurnal cle may be minimized by planning predawn aeri-surveys. (Knapp-USGS)

escriptors: *Tracers, *Cobalt radioisotopes, Groundwater movement, Ion exchange, Clay inerals, Laboratory tests, Radioisotopes, adioactivity techniques, Translocation.
dentifiers: Complexes.

series of Co-60 compounds, considered as poten-ally useful tracers of groundwater movement, ere prepared and evaluated in soil column and batch studies. The compounds were: potassium hexacyanocobaltate (III), potassium ethylenediam-minetetraacetato-cobaltate (III), ammonium 12-tungstodi-cobaltoate (III), chloraquotetrammine cobalt (III) chloride, and sodium hexanitrocobal-tate (III),. The performance of the complexes of CN and EDTA were dependent on their environ-ment and more especially on the type and amount of clay present. The EDTA cobalt complex cannot be used in soils that bare basic or where a large fraction of the clay is saturated with Na or Ca. Of the other radioactive tracers tested, none were suited for groundwater tracing because of instabili-ty in aqueous solution, variable anionic structure under acid conditions, or preferential uptake by the clay fraction. Descriptors: *Remote sensing, *Aerial photography, *Florida, *National Parks, *Marshes, Surveys, Computers, Digital computers, Analog computers, Data processing, Data collections, Hydrologic data, Mapping, Vegetation, Spectroscopy, Photogrammetry.
Identifiers: Everglades National Park.

Multispectral data were used to map automatically eight different landscape site units in a portion of Everglades National Park in south Florida. By using various combinations of narrow spectral bands, it was possible to differentiate and map tree islands, sawgrass grasslands, spikerush grasslands, and two different depths of water. The recognition techniques that were developed employed both digital and analog computing equipment, but the emphasis was on fast processing using analog techniques. The output of the computer was in the form of recognition maps printed in several colors and then overlayed to provide a color composite map of the ground features. Data in this form, collected periodically, can be used to determine the direction and extent of successional changes of vegetation and should provide a better basis for water management practices. The multispectral scanning techniques employed in the Everglades have transfer value to other hydrologic situations. (Knapp-USGS)

Descriptors: *Tracers, *Radioisotopes, *Stable isotopes, *Hydrologic cycle, *Meteorology, Tracking techniques, Hydrogen, Deuterium, Tritium, Oxygen, Fallout, Hydrology, Groundwater movement, Surface waters.
Identifiers: Isotope techniques.

In recent years rather comprehensive studies have been made of the occurrence and distribution in time and space of tritium, deuterium and 0-18 precipitation and atmospheric moisture. Tritium has been injected into the atmosphere, especially during hydrogen bomb tests, in enormous quantities as compared with the natural production in the atmosphere. Because of its radioactivity it can be used as a tracer in the circulation of water in nature, and can, under special circumstances reveal features of the circulation which are otherwise not easily studied. Deuterium and 0-18 in natural waters are subject to fractionation processes during their transport between the earth's surface and the atmosphere. These processes are sometimes easily interpreted and can yield valuable information on particular parts of the water circulation. However, the fractionation processes are often complicated by subsequent mixing processes in the atmosphere, which makes interpretation more difficult. (See also W70-09868) (Knapp-USGS)

HYDROGEN ISOTOPES IN HYDROLOGICAL STUDIES IN ICELAND,
Iceland Univ., Reykjavik.
B. Arnason, and Th. Sigurgeirsson.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Goedesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM 83/3, p 35-47, 1967. 13 p, 6 fig, 10 ref.

Descriptors: *Tracers, *Deuterium, *Tritium, *Groundwater movement, *Hot springs, Surface waters, Precipitation (Atmospheric), Thermal water, Thermal springs, Sampling, Radiochemical analysis.
Identifiers: Iceland.

The deuterium content in monthly samples of precipitation at Reykjavik, Iceland, has been measured continously for the past 8 yr. The results show considerable fluctuations for individual months and a slight annual variation. Numerous water samples from cold springs in south-west Iceland show no time variation in deuterium content, whereas samples taken from streams in the same area show a small variation. Cold springs and rivers have similar deuterium content as the total yearly precipitation in their recharge area as judged from monthly samples. Because the time variations are small, these sources are very useful indicators of the mean deuterium content in the precipitation and its variation with geographical position. A map shows how the deuterium content varies with the distance from the sea and how the distribution is modified by the landscape. Samples of steam and liquid water from some boiling boreholes show that equilibrium is achieved between deuterium concentrations in the vapor and the water phase. This makes it possible to calculate the deuterium content of the recharge water for a hot spring from deuterium measurements of the water phase alone, if the base temperature of the recharge water is known. The thermal waters do not change in deuterium content during passage underground. (See also W70-09868) (Knapp-USGS)

Descriptors: *Sediment load, *Suspended load, *Nuclear meters, Radioactivity techniques, Stream gages, Sediment transport, Instrumentation.
Identifiers: Nuclear sediment meters, Sediment concentration gages.

Three sediment concentration gages, utilizing the attenuation of transmitted gamma rays as a measure of density, were compared in laboratory tests. Two of the gages used Cd-109 as the radioactive source and one employed Am-241. The effects of each probe on stream velocity and sediment concentration gradients within the sampling area were considered. The precision and accuracy of the laboratory measurements were calculated and calibration curves were obtained under both static and dynamic conditions. A minimum detectable sediment concentration of less than 500 ppm was obtained with the Am-241 gage developed by the IAEA laboratories. The Cd-109 gage developed for remote, unattended, automatic operation was the least sensitive to small changes in sediment concentration. In their present state of development, these nuclear-sediment concentration gages supplement rather than compete in their use and performance. Each gage will provide the hydrologist with information not now obtainable by conventional means or will provide more information at a lower expenditure than is now possible. QUANTITATIVE ANALYSIS OF TOTAL CARBON DIOXIDE IN SEA WATER: A NEW EXTRACTION METHOD,
Scripps Institution of Oceanography, La Jolla, Calif.
C. S. Wong.
Deep-Sea Research, Vol 17, p 9-17, 1970. 2 fig, 11 ref.

Descriptors: *Analytical techniques, *Carbon dioxide, *Sea water, *Methodology, Infrared radiation, Sampling, Laboratory tests, Pacific Ocean, Tropic, Depth, Analysis, Calibration, Gravimetric analysis.
Identifiers: Vacuum extraction, Infrared analysis, Extraction procedure, Sodium carbonate.

Total carbon dioxide is defined as the sum of carbon dioxide concentration and all other carbon species in solution, which react with dilute acid to form carbon dioxide. Concentration of total carbon dioxide in seawater has been determined to a precision of plus or minus 0.15% standard deviation and an accuracy of about plus or minus 0.2% by a new method employing vacuum extraction and infrared analysis. This precision and estimated accuracy were achieved through accurate sampling of aliquots by a special pipette, elimination of reagent blanks, purification of carbon extracted and improvements in preparation of a gravimetric standard for calibration of the infrared analyzer. Comparison of extractions made on shipboard and extractions made subsequently in shore laboratory on preserved samples show that ocean water sterilized with 100 ppm of mercuric chloride does not change its total carbon dioxide during storage in stoppered Pyrex bottles at room temperature for a period up to 3 months. The extraction was used to obtain pure carbon dioxide for carbon-13 isotopic studies and for rain and ice. The gravimetric standard has provided for rapid calibration of infrared analyzer or for other methods such as those employing gas chromatography. (Jones-Wisconsin)

A SIMPLE, INEXPENSIVE ALGAL CHEMOSTAT,
North Carolina State Univ., Raleigh. Dept. of Zoology.
Edward J. Carpenter.
Limnology and Oceanography, Vol 13, No 4, p 720-721, 1968. 1 fig, 2 ref.

Descriptors: *Analytical techniques, *Algae, Plankton, Diatoms, Marine algae, Fresh water, Flow rates, Pumps, Electrolysis, Cultures.
Identifiers: *Chemostat, Physiology, Flagellates.

A simple chemostat has been developed which does not use expensive mechanical action pumps or elaborate gravity flow systems. In addition, the entire apparatus can be easily sterilized as a unit if the rubber stoppers in the chemostat are left ajar during autoclaving. An electrolysis pump generates a gas mixture which displaces the culture medium in the medium reservoir into the algae culture vessel. The flow rate of the culture medium is regulated by a variable resistor in the circuit and indirectly monitored with a milliammeter. Mixing and aeration of algae and medium is accomplished by pumping sterile, cotton-filtered air through the culture vessel. An overflow vessel effectively prevents back contamination of the culture vessel by bacteria as a suspension of the organisms under culture continually flows out. The volume of medium within the culture vessel is regulated through siphon action by adjusting the height of the overflow tube. This chemostat has been used successfully in several nutrient limited, axenic experiments on two planktonic marine diatoms and one freshwater flagellate. (Jones-Wisconsin)

entifiers: *Denver (Colo), *Storm drain design anual.

storm drainage criteria manual developed by the enver Regional Council of Governments to prode uniform guidelines and technical design inforation for those involved with storm water ainage is reviewed. The overall approach taken is sed on two separate drainage systems: the initial, convenience, system for regularly occuring flows eturn frequency of once in 2 to 10 years), and the ajor system for relatively infrequent flows. The sign of streets receives extensive coverage, with owable drainage capacity related to traffic lume. Storm sewer design is based entirely on draulics, replacing rule-of-thumb procedures for ad loss at manholes. Hydrological design is based a modified rational method, in which the sumation of flows is used for areas under 200 acres, d on a hydrograph analysis for larger areas. THE EFFECTS OF WATER-SHOCK WAVES ON A HYDRAULIC STRUCTURE,
California State Coll., Los Angeles.
Young C. Kim.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 2-Seminar Communications), Paper S1, p 174-177, 1967. 4 p.

Descriptors: *Explosions, *Seismic waves, *Underwater, *Hydraulic structures, *Model studies, On-site tests, Dams, Engineering.
Identifiers: *Shock waves, Underwater explosions.

The transient response of a rigid concrete structure to water shock waves was investigated. A theoretical solution of the transmitted underwater shock waves impinging on a concrete structure was obtained by treating it as an entirely Laplace-transformed problem. The effect of the transmitted shock waves on plaster and concrete models was also studied experimentally. Underwater shock waves were created by using a submerged exploding wire in a contained environment. Test results confirmed a theoretical analysis of shock wave propagation in a submerged hydraulic structure. (Knapp-USGS)

STUDY OF PIPE WITH CONCRETE BEDDING--PART II,
American Pipe and Construction Co., Monterey Park, Calif.
Harvey C. Olander, and Gordon G. Robertson.
Proceedings of the American Society of Civil Engineers, Transportation Engineering Journal, Vol 96, No TE1, p 25-44, Feb 1970. 20 p, 11 fig, 7 tab, 2 ref, 3 append.

Descriptors: Design, Concrete construction, Loads (Forces), Geometric shapes, *Pipelines, *Pipes, Stress, *Structural analysis, *Coefficients, *Bedding materials, Concrete pipes, Concrete structures, Earth pressure, Dead loads, *Stress analysis, Internal forces, Hydrostatic pressure.
Identifiers: Buried structures, Concrete blocks, Encasement, Pipe cradles.

Part II of a 2-part study of pipe with concrete bedding is presented. Part I covered the basic case, consisting of a structure with a semicircular top of uniform thickness and a base extending upward to the horizontal centerline with vertical sides and a horizontal bottom. A calculation of stresses throughout the base for the case of 180 deg beding demonstrated that the pipe and bedding act together as a monolithic structure. The previous study is extended to the case of beddings less than 180 deg (sometimes referred to as concrete cradles) and to full rectangular encasements. In both cases, the solution is built on the basic case, and tables prepared previously to simplify the calculations may be used. After developing necessary equations, a sample calculation is presented for a 12-ft-dia noncylinder, prestressed concrete pipe with 120 deg concrete bedding. Using the same technique as in the previous study, stresses throughout the base are determined. Consideration of these stresses demonstrates, as before, that under load there is no tendency for separation of pipe and bedding. This is confirmed by a photoelastic stress analysis of the junction between pipe and bedding. (USBR)

DESIGN OF CYLINDRICAL CONCRETE WATER TANKS,
Harvey C. Olander.
Proceedings of the American Society of Civil Engineers, Journal of Structural Division, Vol 96, No ST5, p 947-973, May 1970. 27 p, 25 fig, 14 ref, 2 append.

Descriptors: Beams (Structural), Cylindrical bodies, Deflection, *Wind pressure, Earthquakes, *Foundations, Structural engineering, Reinforced concrete, Temperature, *Water tanks, Winds, *Hydrostatic pressure, Circumferential stress, Bending moments, Footings, *Concrete structures, Shear, Stress.
Identifiers: Earthquake loads, Elastic foundations.

A comprehensive procedure is presented for design of cylindrical concrete water tanks based on the theory of beams on elastic foundations. Temperature stresses are given careful consideration, including variation of temperature through the tank wall. Analysis shows considerable variation of temperature stresses over the tank. Hydrostatic and earthquake forces are also covered. Wind stresses relating to tanks with varying height-to-diameter ratios are analyzed and design procedures are given. Charts covering temperature stresses and varying types of end restraints to tank walls are provided to facilitate solutions by desk calculator. Sample design calculations for a storage tank on spread footing are included. (USBR)

TRACER STUDIES ON TURBULENT DIFFUSION AND DISPERSION,
Chalmers Univ. of Technology, Goteborg (Sweden).
Klas Cederwall.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D3, p 20-32, 1967. 13 p, 11 fig, 3 tab, 2 ref.

Descriptors: *Diffusion, *Dispersion, *Turbulent flow, *Tracers, *Tracking techniques, Dye releases, Closed conduit flow, Open channel flow, Mixing, Mass transfer, Heat transfer, Pipe flow.
Identifiers: Turbulent mixing.

Instantaneous injection of tracer material is an important method for studying turbulent diffusion. The procedure has to be developed and the tracer has to be chosen to suit the particular diffusion

case. Diffusive properties of turbulent flow may be studied by swift point-injections of tracer material. G. I. Taylor's fundamental theory for turbulent diffusion can be adapted to plane injection in a pipe flow. Laboratory investigations show that point injections in the center of the pipe are equivalent to plane injections if the section of injection is displaced virtually in the flow direction. The influence of concentrated losses (constrictions) in the pipe on the turbulent diffusion is transferred to virtual displacements of the point of injection, in the opposite flow direction. The distribution of residence time in a continuous flow system was studied with the same tracer method. An investigation on the hydraulic efficiency of a spiral mixing chamber utilized in water plants for adding chemicals to raw water was based on the concepts of complete mixing and short circuit flow. LINEAR-MOMENTUM FLUX TO OVERBANK SECTIONS,
Geological Survey, Atlanta, Ga.; and Georgia Inst. of Tech., Atlanta.
Robert R. Wright, and Marion R. Carstens.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY9, Paper 7517, p 1781-1793, September 1970. 13 p, 10 fig, 2 tab, 2 append.

Descriptors: *Open channel flow, *Floods, *Overflow, *Hydraulic models, Shear stress, Floodways, Hydraulics, Rivers, Streamflow, Routing, Shear drag.
Identifiers: Linear-momentum flux.

On the basis of experiments in two joined rectangular channels, transfer of linear momentum from the major (less restricted) channel to the minor (more restricted) channel has been demonstrated. The apparent-shear stress on the junction surface was found to be of the same order of magnitude as the boundary-shear stress in the major channel. Based upon this observation, a method for engineering calculations for mean-flow characteristics in joined channels such as a river at flood stage is proposed. The steps in the proposed separate-channel method of analysis are: (1) Considering the major-channel boundary including the junction plane as a solid boundary, compute the mean boundary-shear stress on the major-channel boundary; (2) compute the apparent-shear force on the junction surface using the mean boundary-shear stress of the major channel; and (3) incorporate the apparent-shear force on the junction surface as a propulsive force on the minor-channel flow. (Knapp-USGS)

POWER LAW SOLUTIONS FOR VERTICAL PLUMES,
California Univ., Irvine. Dept. of Civil Engineering.
Richard R. Brock.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY9, Paper 7523, p 1803-1817, September 1970. 15 p, 3 fig, 7 ref, 2 append.

Descriptors: *Diffusion, *Jets, *Mixing, *Turbulent flow, *Convection, Vortices, Turbulence, Hydraulics, Mathematical studies, Mathematical models.
Identifiers: Vertical plumes.

This paper investigates solutions to the problem of a vertically rising turbulent plume generated when a source of light fluid is introduced into a heavier ambient fluid of large extent. The particular solutions considered are those in which the plume width, maximum velocity, and maximum density deficiency can be expressed as a simple power of the vertical distance. It is found that this type of solution exists not only for the well-known cases of point and line sources in a uniform ambient fluid, but also for certain cases of: (1) A finite area source in a uniform ambient fluid; and (2) a point, line or finite area source in a stably and unstably stratified fluid. DIFFUSION OF SUBMERGED SLUICE GATE FLOW OVER A DROP,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and K. Subramanya.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D17, p 156-163, 1967. 8 p, 3 fig, 2 tab, 10 ref.

Descriptors: *Diffusion, *Jets, *Turbulence, *Sluice gates, *Supercritical flow, Model studies, Flumes, Transition flow, Open channel flow, Hydraulic models, Laboratory tests.
Identifiers: Wall jets.

An experimental study was made of the diffusion of a supercritical stream emerging under a submerged sluice gate situated over an abrupt drop. The length of the eddying region, the characteristics of the velocity profile and bed shear stress after reattachment were studied. After a certain distance downstream of the reattachment line, the supercritical stream could be treated as a reattached plane turbulent wall-jet which behaves very much like the corresponding classical wall-jet. The variation of the bed shear stress is expressed in the form of a dimensionless similarity plot. (Knapp-USGS)

AN ANALYSIS OF SALINITY DISTRIBUTION IN THE STRAITS OF MARACAIBO,
Massachusetts Inst. of Tech., Cambridge, Hydrodynamics Lab.; National Inst. of Canalizations, Caracas (Venezuela); and State Univ. of New York, Buffalo. Dept. of Civil Engineering.
Donald R. F. Harleman, Luis F. Corona-Chuecos, and Emmanuel Partheniades.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D18, p 164-173, 1967. 10 p, 7 fig, 5 ref.

Descriptors: *Saline water intrusion, *Inlets (Waterways), *Mathematical models, *Tidal effects, Currents (Water), Water circulation, Model studies, Tides, Dispersion, Turbulent flow, Open channel flow.
Identifiers: Straits of Maracaibo, Venezuela.

Measurements of salinity distributions were made in the Straits of Maracaibo as part of a general investigation of shoaling problems in the navigation channel. The field data on longitudinal salinity distribution were analyzed by a one-dimensional mathematical model based on turbulent dispersion theory. The salinity distribution at low water slack was compared with the mathematical model and two independent parameters which characterize the longitudinal salinity distribution were determined. These parameters are the longitudinal dispersion coefficient, and a characteristic horizontal length which is of the order of magnitude of the tidal excursion. Laboratory studies show that a correlation exists between a dimensionless form of these two parameters and a dimensionless estuary number. The estuary number depends on the tidal prism, the magnitude of the tidal current, the mean depth, the fresh water discharge and the tidal period. The salinity data for the Straits of Maracaibo conform to the expected correlation. Changes in the salinity distribution due to possible modifications of the channel are discussed. (Knapp-USGS)

MEASUREMENTS OF THE INFLUENCE OF SUSPENDED PARTICLES ON THE SIZE OF VORTICES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau und Erdbau.
Andreas Muller.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D12, p 107-114, 1967. 8 p, 12 fig, 3 ref.

Descriptors: *Pipe flow, *Vortices, *Sediment transport, *Particle size, Turbulent flow, Turbulence, Velocity, Open channel flow, Roughness (Hydraulic), Channel flow, Suspension, Suspended load, Fluid friction.
Identifiers: Vortex size.

The influence of particles on vortex size was studied in rough pipes. The autocorrelation of the velocity fluctuations was considered a measure of the size of the vortices. With this method a tendency for the vortex diameter to increase with increasing concentration of the particles can be shown. This effect can be predicted, using a single vortex model, deducing a faster diffusion of the single vortex. (Knapp-USGS)

EXPERIMENTAL RESULTS OF DYE DIFFUSION IN LARGE PIPELINES,
Oregon State Univ., Corvallis. Dept. of Civil Engineering; and Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R. W. Filmer, and Vujica Yevjevich.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D13, p 115-123, 1967. 9 p, 2 fig, 1 tab.

Descriptors: *Diffusion, *Tracers, *Dye releases, *Pipe flow, *Closed conduit flow, Tracking techniques, Fluorescence, Sampling, Monitoring, Dispersion, Hydraulic models, Hydraulics, Laboratory tests, Reynolds number, Turbulent flow.
Identifiers: Rhodamine.

A study was made of the lateral diffusion resulting from continuous point-source injection of soluble tracers into a 36-inch pipeline at high Reynolds numbers. The tracer, the fluorescent dye Rhodamine WT, was injected at various points along a vertical diameter and at various positions along the length of the pipe. By varying the mixing distance and the flow rate, dye concentration was obtained at various cross-sections for Reynolds numbers up to 1.8 million. The experiments were conducted in a 36-inch 825-foot long pipeline. Injection at a constant rate was obtained by use of a

positive displacement chemical proportioning pump, and downstream concentrations were determined continuously with a flow-through fluorometer. Concentration of the diffused material was obtained for as many as 84 different positions in the cross-section under each given set of hydraulic conditions for mixing distances between 27 and 84 diameters and flow rates up to 62 cfs. RADIAL DIFFUSION IN TURBULENT PIPE FLOW,
Illinois Univ., Urbana. Dept. of Civil Engineering; and Bureau of Reclamation, Denver, Colo.
Edward R. Holley, and Jack C. Schuster.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D14, p 124-136, 1967. 13 p, 4 fig, 1 tab, 16 ref.

Descriptors: *Diffusion, *Pipe flow, *Turbulent flow, Tracers, Viscosity, Closed conduit flow, Dispersion, Laboratory tests, Turbulence, Diffusivity, Hydraulics.
Identifiers: Radial diffusion.

Some of the parameters that affect radial diffusion are discussed. The analogy between the radial diffusion coefficient and the eddy viscosity is used to obtain an equation for calculating the diffusion coefficient K. Analytical concentration distributions are presented for steady state diffusion from a source on the centerline of the pipe. The analytical distributions were used to calculate empirical K-values. Forty K-values from various sources are presented. These data show that the amount of lateral spread of the diffusing substance in the pipe has a significant effect on the value of K and that the analogy of diffusion with the eddy viscosity is a fair approximation for K when the diffusing substance fills the pipe cross section. An equation is derived for estimating the distance L required for complete mixing in uniform pipe flow. (Knapp-USGS)

STOCHASTIC SIMULATION OF THE DIFFUSION OF JETS,
Carnegie Inst. of Tech., Pittsburgh, Pa.
Carlos Quevedo, and George Bugliarello.
French resume. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 4 (Pt 1-Microturbulent Diffusion and Dispersion), Paper D16, p 146-155, 1967. 10 p, 8 fig, 8 ref.

Descriptors: *Diffusion, *Jets, *Turbulent flow, Stochastic processes, *Simulation analysis, Mathematical models, Statistical models, Probability, Laminar flow, Hydraulics, Hydrodynamics, Path of pollutants, Dispersion, Open channel flow.
Identifiers: Jet dispersion.

A stochastic simulation technique was applied to the determination of the velocity field of incompressible jets issuing from a two-dimensional orifice. The diffusion of momentum leading to the formation of the velocity profiles of the jets was achieved by a succession of steps, during each one of which a number of particles were generated at the nodes of a fixed reference grid, and subsequently diffused at random in the direction normal to that of the main flow. Both the laminar and turbulent case were simulated by this technique. The turbulent flow study was based on a phenomenological description of the turbulent field. The results reproduce the basic features of the phenomena, but with the present very simple model, quantitative agreement with experimental and analytical data is not yet fully satisfactory. Refinements of the model to achieve a closer agreement are discussed. The simulation poses no limitations as to the initial scope of the velocity profiles issuing from the orifice or to extension to three-dimensional cases. (Knapp-USGS)

CLOSED CONDUIT TO OPEN CHANNEL STILLING BASIN,
Utah State Univ., Logan; and Colorado State Uinv., Fort Collins.
Gordon H. Falmmer, V. Skogerboe Gaylord, and Wei Chi-Yuan.
Proceedings of the American Society of Civil Engineers, Journal of Irrigation Drainage Division, Vol 96, No IR1, p 1-10, Mar 1970. 10 p, 6 fig, 9 ref, 2 append.

Descriptors: *Closed conduit flow, Closed conduits, Design, Tailwater, *Energy dissipation, Hydraulic models, Hydraulic jump, Hydraulics, *Open channel flow, *Stilling basins, Hydraulic structures, Experimental data, *Model studies, Froude number, Laboratory tests, Diffusion, Submergence, Hydraulic design, Design criteria.
Identifiers: *Energy dissipators, Transition, Experimental models.

Criteria have been developed for designing a stilling basin to serve as a transition from closed conduit flow to open channel flow for a fully submerged pipe outlet. The unique feature of the stilling basin is the short-pipe energy dissipator located and designed to provide maximum energy dissipation for the basin configuration. The expanding characteristics of a submerged jet were used in establishing the length of the stilling basin. The unsteadiness of the water surface and the relative boil height in the model basin were used as criteria for evaluation the effectiveness of the structure for energy dissipation. Relationships among the tailwater depth, outlet flume floor elevation, height of boils in the stilling basin, width of the stilling basin, and amount of freeboard have been studied. Interrelationships among these variables are shown graphically. (USBR)

NON-DIMENSIONAL PROFILE AREA COEFFICIENTS FOR HYDRAULIC JUMP IN SLOPING RECTANGULAR CHANNELS,
Surrey Univ., London (England).
J. W. Wielogorski, and E. H. Wilson.
Water Power, Vol 22, No 4, p 144-150, Apr 1970. 7 p, 13 fig, 2 tab, 11 ref.

Descriptors: *Hydraulic jump, Channels, Profiles, Slopes, Hydraulics, Forecasting, Open channels, Froude number, *Coefficients, Open channel flow, Beds.
Identifiers: *Retangular channels.

The hydraulic jump in a horizontal rectangular channel can be represented by a unique generalized nondimensional profile. The jump in a sloping channel was analyzed and its weight accounted for by using nondimensional profile area coefficients. The coefficients may be related to the generalized profile and the relationship justified by results from laboratory tests using photographic methods. An equation was derived to relate the ratio of depths across a jump on a sloping channel bed to the Froude number. The equation is in the Belanger form, containing profile area coefficients accounting for the jump body weight. The nondimensional generalized profile introduced by Rajaratnam and Subramanya was extended to the sloping channel bed case, and a relationship between the area coefficients and the generalized profile was derived. The analysis and investigation provide data to assist in predicting profile characteristics of the hydraulic jump on a sloping channel bed. (USBR)

REGIME THEORY DESIGN OF CANALS WITH SAND BEDS,
Alberta Univ., Edmonton.
Thomas Blench.
Proceedings of the American Society of Civil Engineers, Journal of the Irrigation Drainage Division, Vol 96, No IR2, p 205-213, June 1970. 9 p, 1 fig, 2 tab, 7 ref, 3 append.

Descriptors: *Regime theory, Canals, *Canal design, *Sands, *Dunes, *Beds, *Dune sands, Open channels, Open channel flow, Tractive forces, Sediment transport, Sedimentation, Froude number, Hydraulics.
Identifiers: *Erodible-bed channels, Bed forms, Bedload movement, Bed movements, Bed ripples, Laceys constants.

Recent regime theory design equations for duned sand-bed canals are outlined and limits of applicability indicated. A simple problem is compared with original Lacey equations. Reference to worked problems and extensions is given. Advantages of the method include: (1) equations derived from data of self-adjusting channels of the type and size for which design is required; (2) provision of the 3 necessary and sufficient independent equations for finding equilibrium values of flow area, depth, and slope; (3) consolidation of the unmeasurables of the water-sediment complex and of the cohesive erodible-depositable sides into 2 overall bed and side factors that can be calculated from the running conditions of existing channels in equilibrium; and (4) simplicity. HOW SAFE ARE YOUR TOWERS,
Sargent and Lundy, Chicago, Ill.
Joseph R. Arena.
Proceedings of the American Society of Civil Engineers, Journal of the Structural Division, Vol 96, No ST1, p 1-16, Jan 1970. 16 p, 13 fig, 4 tab, 8 ref, append.

Descriptors: *Transmission towers, Transmission lines, Construction, Foundations, Inspection, Wind pressure, *Loads (Forces), Towers, Winds, Safety, Safety factors, Design, Vertical loads, Tornadoes, Fabrication, Structural engineering.
Identifiers: Tower failures, Transverse loads, Auger-type footings.

The need for a new look in transmission line design because of new and higher voltages being used is described. Vertical, transverse, and longitudinal loads and their effects are considered, with emphasis on a correct assignment of the wind load. Tower design is described together with the importance of considering the costs of material, fabrication, transportation, erection, foundation, and maintenance. Foundations and soil borings are noted, and illustrations of the method of constructing the augered concrete caisson-type foundation are given. Fabrication of the steel tower and relation to the tower design are given. Construction and inspection and their relation to the successful fulfillment of a good design and line performance are covered. (USBR)

AN ACCELERATION RELAY FOR POWER SYSTEMS,
Bureau of Reclamation, Denver, Colo.
W. R. Roemish, C. L. Clemans, and L. W. Lloyd.
Translation, Paper 70 TP 570-PWR, Institute of Electrical and Electronics Engineers, Summer Power Meet and EHV Conf, Los Angeles, Calif, July 1970. 5 p, 7 fig, 5 ref.

Descriptors: *Electric relays, Frequency, *Frequency shifts, Field tests, *Disturbances, Electronic equipment, Power system operations, Research and development, Sensors, Control, Transducers, Electric potential, Characteristics, Sensitivity.
Identifiers: Power system stability, *Acceleration (Mechanical), Load control, *Solid state devices, Thyristors, Line dropping.

A solid-state acceleration relay developed by the Bureau of Reclamation for data acquisition is a sensitive device capable of measuring the rate of change of frequency at a given location on a power system. The relay has a potential also for use in generator dropping and load shedding schemes. A pilot model of the relay has been installed at the Palisades Powerplant in Idaho to assist in collecting system performance parameters. Data acquired during a major system distrubance demonstrate the potential value of the acceleration relay for sensing behavior and for improving power system reliability. Relay construction, operating experience, and future applications of the device are discussed. (USBR)

ALINEMENT AND MODELING OF HANFORD EXCITATION CONTROL FOR SYSTEM DAMPING,
Bonneville Power Administration, Portland, Oreg; and Bureau of Reclamation, Denver, Colo.
Edward J. Warchol, William B. Gish, and Ferber R. Schleif.
Translation, Paper 70 TP 562-PWR, Institute of Electrical and Electronics Engineers, Summer Power Meet and EHV Conf, Los Angeles, Calif, July 1970. 10 p, 13 fig, 2 ref.

Descriptors: *Excitation, *Voltage regulators, Nuclear powerplants, *Power system operations, Field tests, Extra high voltage, *Damping, *Control, Frequency, Electric generators, Computer models, Transmission (Electrical), Evaluation.
Identifiers: *Hanford Steam Plant (Wash), *Turbogenerators, Test results, Frequency response, *Power system stability.

The 2 Hanford generators at 430 mw each are presently the largest generating units in the northwest, and their inertias, reactances, and time constants are unusually large. The influence of system damping by voltage regulators is of great interest to electric power system operators. Alinement of speed excitation supplementary control for each of the 2 Hanford nuclear steam turbine-generator units was readily accomplished through field testing. Off-line frequency response tests of the supplementary control units, voltage regulators and exciters, and frequency and step response tests of the excitation systems provided data for developing a dynamic simulation model of the Hanford units. On-line tests with the generators loaded can be made with local forcing signals barely observable and detectable with sensitive instrumentation. Evaluation of results indicate positive damping of the Hanford units. (USBR)

DESIGN OF EHV SUBSTATIONS FOR PEACE RIVER,
British Columbia Hydro and Power Authority, Vancouver.
G. A. Ganason.
Electrical Review, Vol 186, No 7, p 245-251, Feb 1970. 7 p, 10 fig, 1 tab.

Descriptors: *Extra high voltage, *Extra long distance, Microwaves, *Transmission lines, Transmission (Electrical), *Electrical equipment, *Substations (Electrical), Lightning arresters, Bus (Electrical), Power transformers, Electric relays, Circuit breakers, Foreign construction, Electric insulation, Electrical insulators, Condensers.
Identifiers: *Peace River Proj, Can, Current transformers, Series capacitors, Northwest Power Pool, Canada.

Economy and reliability were the main aims in designing switching stations for the 500-kv Peace River transmission system in British Columbia. Power is transmitted from the Gordon M Shrum Powerplant via the Portage Mountain Substation, a distance of 600 mi over 2 single-circuit 500-kv a-c lines in the initial stage and 4 single-circuit lines in the final stage. The 500-kv switching stations at Williston and Kelly Lake divide the lines into 200-mi sections. The Ingledow 500-kv terminal substation near Vancouver forms the load center for the Vancouver area and a load transfer point to the Bonneville power system, connecting into the Northwest Power Pool of the U.S. Schematics for the substations are shown, and major electrical equipment is described. System insulation coordination and protective equipment are discussed. (USBR)

TUNNEL SURVEY,
D. G. McBeth.
Tunnels and Tunnelling, Vol 1, No 4, Vol 2, No 1, p 179-182, 23-28, Nov-Dec 1969, Jan-Feb 1970. 9 p, 22 fig, 15 ref.

Descriptors: *Surveying, *Surveying instruments, Survey stations, *Tunnels, Tunnel construction, Control, History, *Methodology, Laser, Theodolites, Measurement, Measuring instruments, Electronic equipment, Bibliographies, Foreign construction.
Identifiers: Construction control, Accuracy, Computer applications, Great Britain.

Past, present, and future tunnel survey techniques discussed include: (1) historical aspects of tunnel surveying, (2) accuracy, (3) surface control survey, (4) transference of surface control underground, (5) UNDERGROUND CONTROL SURVEY, (6) tunnel face control while driving, (7) special problems of submerged tube tunnels, (8) microptic theodolites, (9) electronic distance measurement, (10) the precision indicator of the meridian (P.I.M.), (11) lasers, and (12) computation by electronic computer. The golden rule is laying out a survey scheme is to have as few observations of angle or length as is practicable. The only practical means of transferring bearings down vertical shafts is by the wire survey technique. Use of open traverse techniques is the only practical method of extending a survey behind the working face in a tunnel. Because an open traverse is a weak form of control, at least 2 surveys are made. Control of a tunnel face while driving entails tight checks of line, level, and shape of the tunnel and square, plumb, and roll of tunneling shields. By taking full advantage of modern instruments and techniques, an automated system of tunnel control is predicted. (USBR)

AN INVESTIGATION OF THE DASHT-E BAYAZ, IRAN EARTHQUAKE OF AUGUST 31, 1968,
Coast and Geodetic Survey, Rockville, Md.; and Illinois Inst. of Tech., Chicago. Dept. of Mechanical Engineering.
Kenneth C. Bayer, Lorne E. Heuckroth, and Rajab A. Karim.
Bulletin of the Seismological Society of America, Vol 59, No 5, p 1793-1822, October 1969. 30 p, 18 fig, 3 tab, 9 ref.

Descriptors: *Earthquakes, *Disasters, *Seismic studies, On-site data collections, Faults (Geology), Geologic control, Bedrock, Alluvium, Water table, Earthquake engineering, Water wells.
Identifiers: *Iran, Khorassan Province, Qanats.

Seismological data are presented of the very destructive earthquake that occurred August 31, 1968 in Khorassan Province, northeastern Iran. An analysis is made of the regional intensities, the effects on local structures, and the fresh surface faulting phenomenon. Results are given of studies of temporal and spatial characteristics and the magnitude of all recorded seismic activity before, after and including the major event. Having a magnitude of 7.3, the quake destroyed or severely damaged several villages resulting in 10,000 fatalities and 60,000 homeless residents. The measured fault length was 25 kilometers and surface fractures were noted in many areas. Maximum horizontal displacement was a left-lateral movement of 4.1 meters east of Dasht-e Bayaz, 250 Km southwest of Mashad. Extensive property damage is attributed mostly to poor construction but also to the location of some of the villages on alluvium with a shallow water table. Qanats (shallow well systems) in some places ran dry but irrigation wells 30 meters or more deep were undamaged. (Land-USGS)

dentifiers: *Greenside-McAlpine tunneling achine, Great Britain, Machine design, Radial ads, Cutters, Tunnel supports.

he McAlpine tunneling machine, developed for se in soft ground and very soft rock, was quite successful in Great Britain in underground subway ork and in the Toronto Subway in Canada. For ck tunneling, McAlpine combined his machine ith the Greenside heading machine to produce e Greenside-McAlpine tunneling machine with a nall rotating cutting head of about 3 ft dia that averses along an arm rotating about a horizontal aft. The cutting head first enters the tunnel face the center then traverses outward while rotating the arm; all cutting forces are radial, not axial, d the breakout of rock is in tension to a free face. he tunneling machine and rock picks used on the tting head are described. Better criteria are eeded for assessing the toughness, brittleness, and orasiveness of the rock to be cut. Costs can be duced in machine-bored tunnels; important enefits are: accurate profile, less disturbance of rrounding rock resulting in a safer tunnel, and ss support and lining costs with as much as 30% vings in concrete. SHOTCRETING AT HECLA MINING COMPANY,
Hecla Mining Co.
Gordon M. Miner, and Robert S. Hendricks.
Proceedings, II Symposium on Rapid Excavation, p 7-21-7-37, Sabramento State College, Calif, Oct 1969. 17 p, 1 fig, 6 tab.

Descriptors: *Costs, *Supports, *Underground structures, *Application methods, *Pumped concrete, Concrete placing, Concrete technology, Wet condition, Dry condition, Specifications, Concrete mixes, Accelerators, Application equipment, Rebound, *Performance, Shafts (Excavations), Productivity, Mining, *Tunnel linings, Tunnels, *Gunite.
Identifiers: *Shotcrete, Cost savings, Underground openings, Stopes, *Sprayed concrete, Materials handling, Tunnel supports.

Hecla Mining Company has used successfully shotcrete with substantial cost savings for ground support purposes. Hecla's experience indicates that shotcrete is an extremely effective ground support material that can be used successfully in problem areas where various conventional systems would fail. Hecla's use of shotcrete has been limited to openings where long-term, high-quality support was required, to specific areas where exceptionally difficult ground conditions were encountered, and to a limited degree in stope support. When the necessary engineering and an efficient materials handling system have been accomplished, use of shotcrete on a routine basis in stoping and development situations is anticipated. Shotcreting is a continuous process as compared to the cyclic nature of all other support operations, and offers greater opportunity for mechanization. Therein lies its potential for incorporation into the total rapid excavation system. Operational characteristics of the wet and dry shotcrete processes are discussed. Several case studies are presented. (USBR)

Identifiers: France, *Construction methods, Grouting pressure, Silica gel, Construction practices, Sodium silicate, Grout mixes.

Construction of subsurface structures for a new rapid transit railway line in a major, crowded city like Paris creates special problems. The 30-ft-dia tunnel runs below ground-water level through sands and gravels, underneath existing structures. A shield and mole are used for the excavation. Consolidation of soils is provided by chemical grouting. The technique is also used to consolidate the foundations of a bridge over the tunnel when crossing the Seine. A major station 750 ft long, 130 ft wide, and 60 ft high is excavated in difficult geological conditions complicated by existing services, railway tunnels in operation, and buildings. Silicate and resin grouting provide the consolidation without recourse to compressed air or dewatering. A classification of modern chemical grouts and their limits of injectability is given. Elaborate grouting procedures prove their efficiency in supplementing or replacing modern tunneling methods when grouting is thought to be a reliable construction procedure. (USBR)

PROGRAM OF THE WATER RESOURCES DIVISION, TEXAS DISTRICT FOR THE 1970 FISCAL YEAR AND SUMMARY OF DISTRICT ACTIVITIES DURING FISCAL YEAR 1969.
Geological Survey, Austin, Tex. Water Resources Div.

U S Geological Survey Information Bulletin, February 1970. 35 p.

Descriptors: *Water resources, *Investigations, *Network design, *Texas, Bibliographies, Publications.
Identifiers: *Basic data network, *Information bulletin, State of Texas, USGS Water Resources Division.

The program of the U. S. Geological Survey, Water Resources Division in Texas consists of collection of basic records through the hydrologic-data network, interpretive studies, and research. This report summarizes the scheduled activities of the Water Resources Division in Texas for the 1970 fiscal year (July 1, 1969 to June 30, 1970) and includes a list of U. S. Geological Survey reports published or released during the fiscal year 1969. (Woodard-USGS)

SELECTED WATER RESOURCES ABSTRACTS

JAN 19 1971

VOLUME 3, NUMBER 24
DECEMBER 15, 1970

W70-10034 -- W70-10500

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

OF THE MASS BALANCE METHOD FOR MINING THE ROLE OF SOILS IN CON- LLING WATERSHED PERFORMANCE,
cultural Research Service, University Park, Pa. heast Watershed Research Center.
iwitz, E. T. Engman, and G. D. Cline.
r Resources Research, Vol 6, No 4, p 1115- , August 1970. 9 p, 3 fig, 2 tab, 12 ref.

riptors: *Rainfall-runoff relationships, *Water ice, *Hydrologic budget, *Subsurface runoff, water movement, Small watersheds, Percola- Topography, Hydrograph analysis.
ifiers: *Soil water-runoff relationships, Mass ice.

A two year preliminary study of the water balance of a 162-hectare watershed in Pennsylvania showed that spring and summer storms produced practically no overland surface runoff during the storms, but these storms did produce typical hydrographs having all the characteristics usually attributed to surface runoff. Less than 5% of the rainfall, and one third or less of the total runoff appeared as storm runoff. Since virtually all the water eventually reaching the stream channels infiltrated the soil and most of it percolated through the soil, the properties of the soil and the amount of water stored in this layer emerge as the most important regulators of runoff in the system. APPLICATION OF THE CONVOLUTION RELATION TO ESTIMATING RECHARGE FROM AN EPHEMERAL STREAM,
Arizona Univ., Tucson. Hydrology and Water Resources.
Allen F. Moench, and Chester C. Kisiel.
Water Resources Research, Vol 6, No 4, p 1087-1094, August 1970. 8 p, 5 fig, 1 tab, 5 ref.OWRR Projects A-010 and B-007.

Descriptors: *Recharge, *Surface-groundwater relationships, *Mathematical models, Linear programming, Aquifers, Hydrogeology, Water level fluctuations, Unsteady flow, Dupuit-Forchheimer theory, Synthetic hydrology, Ephemeral streams, Input-output analysis.
Identifiers: Aquifer recharge models.

A linear model that permits calculation of recharge to the water table from a source of finite width and infinite length uses water level measurements made in an observation well near the source and independently estimated aquifer constants. The method requires determination of the input given the output (water level measurements) and the impulse response as a function of space and time. The latter is derived from the linear equations of groundwater motion for the particular geometry of this study. The input is obtained from the discrete form of the convolution integral by using the synthetic division method and is then summed over the appropriate time period to obtain total recharge. For the particular recharge event studies, results agree satisfactorily with an independent estimate of recharge and demonstrate that the convolution relation has practical application to groundwater flow problems. (Knapp-USGS)

APPLICATION OF LINEAR RANDOM MODELS TO FOUR ANNUAL STREAMFLOW SERIES,
Alaska Univ., College; and Wisconsin Univ., Madison.
Robert F. Carlson, A. J. A. MacCormick, and Donald G. Watts.
Water Resources Research, Vol 6, No 4, p 1070-1078, August 1970. 9 p, 12 fig, 2 tab, 11 ref.

Descriptors: *Streamflow forecasting, *Regression analysis, *Time series analysis, *Correlation analysis, Gaging stations, Data collections, Statistical methods, Statistics, Markov processes, Stochastic processes.
Identifiers: Hydrologic series, Streamflow series.

A simple method for describing random time series is illustrated by application to the annual streamflow data of the St. Lawrence, the Missouri, the Neva, and the Niger rivers. The techniques is illustrated for identifying the appropriate form of the general autoregressive moving average model by use of the sample autocorrelation function of each series. The values of the parameters of the suggested model of each series are estimated and the results checked to suggest further modification of the model. The best model for each of the four samples showed a reduction in the variance value to 0.49, 0.64, 0.59, and 0.62 of the original variance with the use of one or two parameters. The use of the model for one year ahead forecasting on the Missouri River data is shown. (Knapp-USGS)

THE ATMOSPHERIC WATER BALANCE AND THE HYDROLOGY OF LARGE RIVER BASINS,
Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
James L. Rasmussen.
Water Resources Bulletin, Vol 6, No 4, p 631-639, July-August, 1970. 9 p, 5 fig, 1 tab, 20 ref. OWRR Project B-035.

Descriptors: *Water balance, *Synoptic analysis, *Colorado River Basin, Hydrologic budget, Rainfall-runoff relationships, Climatology, Meteorological data, Meterorology, Regions, Surveys, Evapotranspiration, Discharge (Water), Runoff forecasting, Streamflow forecasting.
Identifiers: Atmospheric water balance.

The concept of using the atmospheric water balance technique in the study of the hydrology of large river basins is described. The atmospheric water balance technique consists of determining the spatial and time distributions and fluxes of water vapor through the atmospheric volume overlying the basin. Precipitation minus evaporation at the earth's surface is determined as a residual of the computation. Results of experiments employing this technique are reviewed. The technique is demonstrated by the hydrometeorology of the Upper Colorado River Basin. The seasonal accumulation of water over the basin is highly correlated with annual runoff. The daily evaporation rate during dry days varies by a factor of 2 over the winter season, and is related to the incoming solar radiation intensity. (Knapp-USGS)

RUNOFF GENERATION IN WESTERN WASHINGTON AS A FUNCTION OF PRECIPITATION AND WATERSHED CHARACTERISTICS,
Washington State Univ., Pullman. Coll. of Engineering Research Div.
John S. Gladwell.
Available from NTIS as PB-194 461, $3.00 in paper copy, $0.65 in microfiche. Completion Report, College of Engineering, Research Division, Bulletin 319, June 1970. 341 p, 56 fig, 46 tab, 74 ref. OWRR A-028-WASH (1).

Descriptors: *Precipitation (Atmospheric), *Discharge (Water), *Hypsometric analysis, Variability, Geomorphology, Regression analysis, Synthetic hydrology, *Watersheds, Correlation analysis, *Runoff, *Rainfall-runoff relationships, Washington.

Twenty-nine watersheds of Western Washington are studied to establish relationships between precipitation and runoff as modified by physiographic characteristics. The relationships are studied using primary statistical parameters of the hydrologic series. It is established that the mean annual discharge and the mean annual hydrograph (using monthly sub-units) are highly correlated to watershed hypsometry. The standard deviation of annual discharge is shown to be generally predictable on the basis of precipitation data; it is also found to be a linear function of the mean annual discharge. Precipitation skewness and kurtosis are shown to be roughly defineable by geographic delineations. Runoff skewness is generally less than

that of precipitation. Kurtosis of runoff is less easily defined but generally has a value of less than three. Annual precipitation appears to be serially correlated, and the correlogram of runoff is shown to be highly correlated to that of precipitation. Cross-correlations of precipitation and of runoff series are shown to be functions of proximity and of a directional component. Harmonic analyses of the runoff and precipitation series indicate strongly that cycles of approximately 16.5 and 5.5 years may exist.

SELECTION OF FREQUENCY DISTRIBUTION MODELS,
Nevada Univ., Reno.
Vulli L. Gupta.
Water Resources Research, Vol 6, No 4, p 1193-1198, August 1970. 6 p, 1 fig, 3 tab, 22 ref.

Descriptors: *Mathematical models, *Statistical models, *Statistical methods, Statistics, Frequency analysis, Hydrologic data, Data processing, Computer programs, Parametric hydrology, Regime, Floods, Droughts.
Identifiers: Frequency distribution models.

A method is considered for selecting mathematical models to fit frequency distributions of hydrologic data among ten commonly used methods of frequency analysis. The methods are those of Gumbel, Lieblein, Chow, and the seven types of Gringorten. The best fitting model is chosen on the basis of comparison for goodness of fit indicated by the coefficients of determination. Friedman's non-parametric statistical test was employed to detect significant differences between the models. (Knapp-USGS)

2B. Precipitation

A CRITIQUE OF METHODS SIMULATING RAINFALL,
Imperial Coll. of Science and Technology, London (England).
M. J. Hall.
Water Resources Research, Vol 6, No 4, p 1104-1114, August 1970. 11 p, 3 fig, 1 tab, 43 ref.

Descriptors: *Rainfall simulators, *Artificial precipitation, *Simulated rainfall, *Reviews, *Hydraulic models, Model studies, Equipment, Instrumentation, Design, Research equipment.
Identifiers: Rainfall simulation research.

In natural rainfall the range of drop sizes increases with increasing rainfall intensity. If a network of nozzles is used to generate artificial rainfall, an increase in working pressure increases the average intensity but decreases the range of drop sizes within the spray. This property has hindered the development of the rainfall simulator more than any other single factor. Alternative methods of simulating rainfall, which depend upon individual drop forming elements such as hypodermic needles for example, are capable of producing sprays with uniform drop sizes only. Such methods have been employed successfully in generating storm patterns involving both temporal and spatial variations in intensity for laboratory catchment studies. A general purpose rainfall simulator, combining control of application rates in both space and time with the reproduction of the drop size distributions and velocities of fall of drops observed in nature, has yet to be developed. (Knapp-USGS)
W70-10065

THE nTH ROOT NORMAL DISTRIBUTION OF PRECIPITATION,
Nevada Univ., Reno. Center for Water Resources Research.
Charles K. Stidd.
Water Resources Research, Vol 6, No 4, p 1095-1103, August 1970. 9 p, 9 fig, 3 tab, 12 ref.

Descriptors: *Time series analysis, *Precipitation (Atmospheric), Data collections, Synthetic hydrology, Simulation analysis, Statistics, Statistical methods, Runoff forecasting.
Identifiers: Synthetic precipitation series.

A computer-generated stationary time series was modified by processes analogous to those that produce precipitation. The resulting numbers have the distributional characteristics of precipitation data. A quantitative explanation is thereby obtained for the skewness in precipitation distributions, and the nth root normal distribution is verified. (Knapp-USGS)

A FAST, APPROXIMATIVE METHOD FOR INTEGRATING THE STOCHASTIC COALESCENCE EQUATION,
National Center for Atmospheric Research, Boulder, Colo.
Rainer Bleck.
Journal of Geophysical Research, Vol 75, No 27, p 5165-5171, September 20, 1970. 7 p, 8 fig, 10 ref.

Descriptors: *Raindrops, *Condensation, *Cloud physics, *Stochastic processes, Statistics, Statistical models, Meteorology, Atmospheric physics, Precipitation (Atmospheric).
Identifiers: *Stochastic coalescence (Raindrops), Raindrop coalescence.

The use of mean values of the raindrop number density in the coalescence equation is shown to lead to a system of ordinary differential equations that provide good approximative solutions with a minimum of computational efforts. The coefficients in this system of equations are functions of the kernel and can be obtained by simple quadrature. Comparisons are made between numerical and analytic solutions for two types of kernels (constant and sum of arguments), using a Gaussian initial distribution of cloud droplets. Systematic deviations of the numerical results from corresponding analytic solutions are shown to depend on the choice of variables, and methods to suppress these deviations are discussed. (Knapp-USGS)

2C. Snow, Ice, and Frost

DROPLET FREEZING BY SURFACE NUCLEATION,
State Univ. of New York, Albany.
Narayan R. Gokhale, and James Goold, Jr.
Journal of Applied Meteorology, Vol 7, No 5, p 870-874, October 1968. 5 p, 4 fig, 1 tab, 10 ref. NSF Grant No GA-328.

Descriptors: *Freezing, *Cloud seeding, *Silver iodide, *Clay minerals, *Nucleation, Cloud physics, Supercooling, Crystallization, Temperature, Snow, Particle size, Crystallography.
Identifiers: Surface nucleation.

Droplet freezing by surface nucleation has been observed during the course of studies of ice nucleation. A constant rate of cooling apparatus and a specially constructed cold chamber were used for this study. Silver iodide particles sprinkled on supercooled, millimeter-size water drops are effective in freezing the drops at -5C. Particles of naturally occurring silicates were found to be effective in the range -7 to -10C. Thus, the ice nucleating ability of such dry particles is much greater by the surface contact mechanism than when particles are embedded in the drops. The importance of the surface nucleation mechanism in forming solid hydrometeors in cumulus clouds is discussed. (Knapp-USGS)

NATURAL FREEZING AND THAWING IN A SILT AND A SAND.
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
Richard A. Sartz.
Soil Science Vol 109, No 5, p 319-323, 1970.

Descriptors: *Frozen soils, *Impervious soils, *Thermal properties, *Soil water, *Physical properties, Porosity, Soil texture, Hydrologic properties, Wisconsin.

Since it can affect infiltration and soil water storage, soil freezing often affects the hydrology of northern watersheds under winter and early spring conditions. The rate at which different soils freeze and thaw varies with their physical properties as well as with the temperature gradient. Depth of frost penetration and rate of freezing and thawing were studied in field profiles of a sandy and a silty soil. Frost depth was measured by penetrometer and resistance blocks and rate of freezing and thawing at a given depth were determined by gradual changes in resistance block readings. Although the two soils began to freeze at the same time, frost penetrated faster and deeper and thawed sooner in the sandy soil. During the spring thaw frost persisted in the silt 3 weeks longer than in the sand. Frost undergoes gradual changes during freezing and thawing that may affect its permeability. (Sartz-Forest Service)

vaporation, as measured with a Class A pan
standardized conditions, is a reliable index of
te as it pertains to evapotranspiration. Pan
oration is being measured in many places in
world, but when not available, may be esti-
d from many formulas, some of which are in-
d here. Potential evapotranspiration can be
ated from pan evaporation or computed
ly from radiation and climatic data.
otranspiration varies with crops, but can be
ated best from potential evapotranspiration or
ly from pan evaporation. Three formulas are
nted for estimating Class A pan evaporation
for estimating potential evapotranspiration.
e formulas may be applied in either English or
c units. Coefficients are presented from which
l evapotranspiration may be estimated from
r measured or estimated pan evaporation, or
estimated potential evapotranspiration. Ir-
on water requirements depend basically upon
otranspiration, but also depend upon
pitation and water application efficiency. As
resources become more limiting, the need for
r estimates of evapotranspiration will in-
e. (USBR)

POTRANSPIRATION BY WOODY
EATOPHYTES IN THE HUMBOLDT
ER VALLEY, NEAR WINNEMUCCA,
ADA,
ogical Survey, Washington, D.C.
Robinson, and A. O. Waananen.
ale by the Superintendent of Documents, US
rnment Printing Office, Wash, DC, 20402 -
55 cents. US Geological Survey Professional
r 491-D, 1970. 41 p, 26 fig, 11 tab, 9 ref.

riptors: *Evapotranspiration, *Phreatophytes,
ada, Rabbitbrush, Willow trees, Arid cli-
s, Alluvial channels, Consumptive use, On-site
Lysimeters, Water levels, Water table,
ndwater.
ifiers: Winnemucca (Nev), Humboldt River
).

Evapotranspiration by phreatophytes was studied in the Winnemucca reach of the Humboldt River valley, Nevada. Water that is wasted by evapotranspiration from areas of low beneficial phreatophytes is one of the largest unknowns in the water budget of the reach. Twelve tanks ranging in size from 30 feet square and 10.5 feet deep to 10 feet square and 7 feet deep were constructed. Seedlings of greasewood were planted in 2 tanks and rabbitbrush in 3 tanks; cuttings of willow were planted in 3 tanks and wildrose in 3 tanks. The twelfth was left bare. The tanks were operated during the growing season April 1 to October 20 from 1961-67, inclusive. Water metered into elevated reservoirs was supplied by gravity to the evapotranspiration tanks. Evapotranspiration by a given species of phreatrophytes is affected by climatic conditions, of which temperature is the most important. Water use by greasewood and rabbitbrush in April was only about 2% of the yearly total, whereas during the months of peak use it was 28%. More than two-thirds of the annual use occurred during June, July, and August. The annual use of water ranged rather widely over the study period, as the plants responded to the effect of plant damage, boron toxicity, depth of the water level, and warmth and length of the growing seasons. Draft from the water table, equivalent to the water supplied to the tanks, varied with the rainfall. It was greatest when rainfall was scant, and least when the rains were copious. (Knapp-USGS)
W70-10243

INFLUENCE OF SOLAR RADIATION REFLECTANCE ON WATER EVAPORATION,
Virginia Univ., Charlottesville. School of Engineering and Applied Science.
J. Taylor Beard, and John L. Gainer.
Journal of Geophysical Research, Vol 75, No 27, p 5155-5163, September 20, 1970. 9 p, 6 fig, 5 tab, 21 ref. OWRR Project A-019-VA and USBR Contract 14-06-D-6385.

Descriptors: *Evaporation control, *Monomolecular films, *Solar radiation, *Albedo, Reservoir evaporation, Alcohols, Oil, Dye releases.
Identifiers: Reflectance, Colored monolayers.

Evaporation in water reservoirs may be reduced by increasing the reflectance of solar energy. Such a change in reflectance will require a surface modification such as the application of a special surface film or monolayer with good reflecting properties. Colored monolayers and artificially dyed monolayers were studied experimentally. A large number of dyes were investigated, but in no instance did the dyes color the monolayer or form a monolayer themselves. A yellow silicone oil film on a water surface was found experimentally to relect solar energy about 1.7 times better than a plain water surface and also to reduce the evaporation rate. In addition, the film was extremely difficult to remove from a water surface. The transient energy equation for an element of a water surface was solved by numerical methods. The analytical model gave an average evaporation suppression by cetyl alcohol of 22.6%, which is consistent with previous experimental work. Results for monolayers with hypothetical reflectance properties and with the diffusion properties of a cetyl alcohol monolayer showed average evaporation reductions of 25 to 45%, depending on the reflection properties. IMPROVING TREE TRANSPIRATION ESTIMATES BASED ON HEAT PULSE VELOCITY MEASUREMENTS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Robert H. Swanson.
International Union Forestry Research Organization Congress, Sept 4-9, 1967, Munich, Germany, Vol 1, Section 11, p 252-263, 1967. 6 fig, 8 ref.

Descriptors: *Transpiration, *Trees, *Respiration, *Circulation (Plants), Consumptive use, Analytical techniques, Heat flow, Density.
Identifiers: Heat pulse velocity (Trees).

To estimate tree transpiration from heat pulse velocity, the mean sap flux and the area of the sap stream in cross section must be known. Sap flux is computed from heat pulse velocity, wood moisture content, density, and specific heat. This paper shows that the cross-sectional area within which sap ascends, the moisture content, and density of the conducting wood are not constant. Changes in these values must be considered before comparative transpiration estimates from heat pulse velocity are made. (Knapp-USGS)
W70-10286

THE EXPECTED EFFICIENCY OF WATER UTILIZATION IN PLANTS UNDER DIFFERENT COMPETITION AND SELECTION REGIMES,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
D. Cohen.
Israel Journal of Botany, Vol 19, No 1, p 50-54, March 1970. 4 ref.

Descriptors: *Water utilization, *Efficiencies, *Photosynthesis, *Transpiration, *Competition, Stomata, Semiarid climates, Climatology, Soil moisture, Soil surfaces, Plant physiology, Root systems, Consumptive use, Soil-water-plant relationships.
Identifiers: *Selection, Mediterranean climates.

The ratio of net photosynthesis to transpiration may be called the efficiency of water utilization for photosynthesis. Since changes in such factors as temperature, humidity, and light intensity influence rates of photosynthesis and transpiration, the ratio shows great daily and seasonal variation. If plants open their stomata only when efficiency is high, then plants will grow slowly but efficiently. However, if plants open their stomata when efficiency is low, then they grow quickly but inefficiently. Competition and selection appear to favor plants which grow quickly and remove soil water before it can be utilized by slow-growing plants. Therefore, high efficiency should occur naturally only if root systems of individual plants are not near the soil surface and do not overlap the root systems of other plants. This paper is based on studies of plant water utilization in Mediterranean climates. (Carr-Arizona)

EVAPOTRANSPIRATION ESTIMATES IN A SEMIARID CLIMATE,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
W. L. Pelton, and H. C. Korven.
Canadian Agricultural Engineering, Vol 11, No 2, p 50-53, 61, November 1969. 4 fig, 1 tab, 16 ref.

Descriptors: *Evapotranspiration, *Equations, *Irrigation practices, *Scheduling, *Semiarid climates, Alfalfa, Water requirements, Irrigation efficiency, Irrigation, Timing, Meteorological data, Lysimeters, Estimating, Estimating equations.
Identifiers: *Saskatchewan (Canada), *Penman equation, *Thornthwaite equation *Blaney-Criddle equation, *Irrigated agriculture, Canadian Prairie.

Three methods of estimating evapotranspiration from meteorological data were tested on irrigated alfalfa (Medicago sativa) at Swift Current, Saskatchewan, Canada. For 53 days during the 1967 growing season lysimeter observations were compared to evapotranspiration estimates from the Penman, Thornthwaite, and Blaney-Criddle equations. The latter two methods predicted weekly water requirements of alfalfa with reasonable accuracy, but described actual daily evapotranspiration inadequately. Although the Penman equation would require modification before being acceptable for general use on the Canadian Prairie, it was able to account for 65 percent of the variation in daily evapotranspiration. Further evaluation is necessary to test these equations for monthly and seasonal use. (Carr-Arizona)

EVAPORATION--RAIN FALLING UP,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.

Charles A. Troendle, and James D. Phillips.
West Virginia Agriculture and Forestry Vol 3, No 2, p 5, 11, 12, Spring 1970.

Descriptors: *Evaporation, *Evapotranspiration, *Solar radiation, Advection, Air temperature, Climatic data, Humidity, Wind velocity, West Virginia.
Identifiers: *Evaporation pan, Barometric pressure, Daily evaporation, Lake evaporation.

Data collected at the U. S. Weather Bureau Climatic Station at the Timber and Watershed Laboratory in Parsons, W. Va. were used for a twofold analysis. First, equations were developed for estimating daily pan evaporation from solar radiation, wind speed, air and water temperatures, and barometric pressure. The best overall estimator of pan evaporation was: Pan Evaporation—Daily Radiation..Mean Air Temperature. Then, the factor used to estimate potential evapotranspiration from pan evaporation was corrected for local climatic conditions. The corrected factor averaged 0.78 for May through September. (Troendle-Forest Service)

THE RADIANT ENERGY BUDGET OF CLEARCUT AND FORESTED SITES IN WEST VIRGINIA,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
J. W. Hornbeck.
Forest Science Vol 16, No 2, June 1970, p 139-145.

Descriptors: *Albedo, *Energy budget, *Snow cover, *Solar radiation, Advection, Air temperature, Climatology, Convection, Evapotranspiration, Heat balance, Heat transfer, Microclimatology, Radiation, Wind velocity, Clear-cutting, West Virginia.
Identifiers: *Hardwood forests, Radiant energy budgets, Radiometers.

Radiant energy budget components were measured over a clearcut site and a hardwood forest site on a gaged watershed in West Virginia. Results show that clearcutting caused changes in both albedo and upward thermal radiation values. The magnitude of these changes varied by season of the year. The clearcutting had an albedo that was nearly constant at 14 percent during snowfree conditions but ranged up to 83 percent during periods of snow cover. On the other hand, the forest albedo ranged from 14 percent for a leafless and snowfree period to about 20 percent for full leaf conditions and to 32 percent during periods of snow cover. The clearcutting had greater upward thermal radiation losses except during periods of snow cover when both sites were nearly identical. Despite the seasonal variability, net radiation values for the two sites did not differ greatly except during periods of snow cover. (Hornbeck-Forest Service)

VALUE OF STREAMFLOW DATA FOR PROJECT DESIGN-A PILOT STUDY,
Geological Survey, Fort Collins, Colo.; Colorado State Univ., Fort Collins; Corps of Engineers, Sacramento, Calif; and Geological Survey, Washington, D.C. Hydrologic Systems Lab.
S. R. Dawdy, H. E. Kubik, and Edward R. Close.
Water Resources Research, Vol 6, No 4, p 1045-1050, August 1970. 6 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Streamflow forecasting, *Planning, *Stochastic processes, *Simulation analysis, *Data collections, Design, Statistical methods, Statistics, Data processing, Water yield, Cost-benefit analysis, Synthetic hydrology, Water costs, Reservoir desing, Hydraulic design.

The value of streamflow data for project design is related to benefits forgone because of insufficient streamflow data. Stochastic simulation of a long-term hypothetical record for a sample station is used to determine a reservoir design based on full (hypothetical) information. Shorter segments of the long-term trace are then used for design under the same criteria in order to compute benefits forgone as a result of lack of full information. For the station used in this study, a low mean flow, high variability station, the marginal value of streamflow data approaches the marginal cost at some time beyond the length of 100 years. The manner in which the value of streamflow data for project design can be evaluated is illustrated. (Knapp-USGS)

THE FRICTION COEFFICIENT FOR SHALLOW FLOWS OVER A SIMULATED TURF SURFACE,
University of the West Indies, St. Augustine (Trinidad).
H. O. Phelps.
Water Resources Research, Vol 6, No 4, p 1220-1226, August 1970. 7 p, 2 fig, 1 tab, 7 ref.

Descriptors: *Overland flow, *Roughness (Hydraulic), *Turf, *Hydraulic models, Fluid friction, Reynolds number, Energy losses, Discharge (Water), Flow resistance, Hydraulics, Porous media, Flumes, Mathematical models, Laminar flow, Turbulent flow.
Identifiers: Overland flow over turf.

The friction coefficient of rough surfaces must be known for the application of the basic momentum and continuity equations to the modeling of overland flow. Flume experiments on steady, uniform flows in the laminar and transitional regions over a simulated turf surface provide the data required to investigate the general hydraulic roughness properties of natural turf, and the particular parameters that are likely to influence the friction coefficient. Because boundary geometry depends on flow depth, this factor must be considered in calculating the relationship between friction coefficient and Reynolds number. By maintaining constant depths while varying the Reynolds number, the separate effects of boundary geometry and Reynolds number on the friction coefficient are demonstrated. The results, which are presented in the form of a friction coefficient chart, may be rationally explained if the simulated turf is considered to be a complex porous medium in which the boundary geometry is variable. THE FLOW OF A STREAM THROUGH RESERVOIR,
Gemeinnutziges Institut, Duesseldorf (West G many).
K. Sauerwein.
In: Isotopes in Hydrology, Proceedings Symposi of International Atomic Energy Agency and Int national Union Geodesy and Geophysics, Vien Nov 14-18, 1966: International Atomic Ene Agency STI/PUB/141, Vienna, Paper No S 83/48, p 697-719, 1967. 23 p, 14 fig, 1 tab.

Descriptors: *Currents (Water), *Reservoi *Tracers, *Radioisotopes, Radioactiv techniques, Dye releases, Streamflow, Mixi Dispersion.
Identifiers: Reservoir flow.

If a reservoir is fed from a single source, which m not always be pure, the extent to which the inflo ing stream mixes with the water in the reservoi important for the quality of the water supplied the reservoir. The question was investigated at Lingese Reservoir, containing between one a two million cubic meters of water, in the Bergisch Land (North Rhine-Westphalia). The investigati was carried out at four different seasons so that varying effects of the stream-water temperatu could be studied in relation to the temperature the reservoir water. The stream was radioactiv labeled at the point of inflow into the reservoir, a its flow through the reservoir was measured length and depth from boats, by means of l-m-lo

Geiger counters. Comparisons were made with simultaneously performed dye and slat experiments, but the four isotope experiments carried out at different seasons were found to be more suitable than the other procedures for investigating limnological processes and evaluating them quantitatively. FLOW SERIAL CORRELATION AND RELATED STREAMFLOW GENERATION MODELS,
Washington State Univ., Seattle. Charles W. Harris Hydraulics Lab.
William J. Stolte, and Eugene P. Richey.
Available from NTIS as PB-194 459, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Charles W. Harris Hydraulics Laboratory Technical Report No. 29, June 1970. 154 p, 23 fig, 6 tab, 35 ref. OWRR A-035-WASH (1).

Descriptors: Hydrology, Stochastic processes, Runoff, Climatic factors, Flow, *Flow characteristics, Model studies, *Hydraulic models, Synthetic hydrology, Washington, Statistical models, River basins, Regression analysis.

The goal of the research was to investigate both the mathematical and physical aspects of flow generation processes. The mathematical aspect of the study indicated that the statistics of annual and monthly flows are intrinsically related. Therefore it is desirable that generated monthly flows should yield acceptable annual flows. Multiple regression equations incorporating from 1 through 12 preceding flows as predictor variables were used to generate monthly flows from which annual flows were derived. The statistics of both the monthly and annual flows gained by this process, were compared to those of the recorded flows in order to determine the accuracy of flow generation by these models and to choose the most acceptable model. It was found that the lag 1 model was the most desirable but that it had deficiencies in some respects. The physical aspect of flow generation was studied by determining the physical causes of, and prediction equations for, a poorly understood component of the lag 1 flow generation model, namely, the lag one serial correlation coefficient. It was found that the influence of climate on the serial correlation coefficient strongly predominates over that of basin characteristics in the region studied. It was concluded that groundwater storage was not of great importance in the variation in the flow serial correlation from basin to basin. It was also found that the prediction equations for the lag one serial correlation coefficient were deficient in some respects and could not be used with great confidence. More work is needed in developing accurate indices of the various physical causes influencing the flow regime. These results are not necessarily applicable to other regions where climatological and geographic conditions are different from those of Western Washington.

INTERNAL CURRENTS RESULTING FROM INTERMEDIATE DENSITY INFLOWS INTO STRATIFIED RESERVOIRS,
Washington Univ., Seattle. Charles W. Harris Hydraulics Lab.
Walter F. Rittall, and Bruce W. Hunt.
Available from NTIS as PB-194 460, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Charles W. Harris Hydraulic Laboratory, Technical Report 28, June 1970. 32 p, 17 fig, 5 ref. OWRR A-023-WASH (1).

Descriptors: *Stratified flow, *Hydraulic jump, Density currents, *Reservoir, Flow, *Density stratification, Depth, Froude number, Reynolds number, Slopes, *Open channel flow.

An experimental study has been made of the flow pattern which results when an inflow of intermediate density enters along the sloping bottom of a two-layer, density-stratified reservoir. It was found that a hydraulic jump may form within the reservoir at the fluid interface, and much of the study was focused upon the characteristics of this jump. It was found during the course of the study that the ratio of downstream to upstream jump depth depends mainly upon the ratio of densities across the top fluid interface, the channel slope, a densimetric Froude number, and a Reynolds number. Difficulties arose during the study because of the impossibility of controlling both the Reynolds and Froude numbers simultaneously. However, by combining the results of this study with two other related studies, it was found possible to extrapolate approximate depth relationships for flows at higher Reynolds numbers.

ADAMS V TOWN OF RUSTON (ACCELERATED EROSION OF NATURAL STREAM BY DISCHARGE OF SWIMMING POOL WATER).

194 La 403, 193 So 688-690 (1940).

Descriptors: *Louisiana, *Swimming pools, *Drainage, *Accelerated erosion, Bank erosion, Degradation (Stream), Soil erosion, Stream erosion, Damages, Superimposed drainage, Drainage practices, Drainage water, Riddance (Legal aspects), Ditches, Swimming, Cities, Judicial decisions, Legal aspects, Water injury, Natural streams, Water conveyance, Drainage systems, Drainage programs, Discharge (Water), Property values.

Plaintiff downstream landowner sought an injunction to prevent defendant city from periodically emptying swimming pool water into a natural drain which traversed plaintiff's unimproved land. Plaintiff claimed the swimming pool water had eroded the drain, causing a diminution in his property value. The court found that the swimming pool water did not cause the drain to overflow its bank, and that the damage to plaintiff was negligible. The court did not consider defendant's contention that since plaintiff had not complained for eight years, he was estopped from seeking an injunction. Since plaintiff could be adequately compensated by money damages, the court denied the injunction. (Hart-Florida)

QUANTITY AND CHEMICAL QUALITY OF LOW FLOW IN THE PRAIRIE DOG TOWN FORK RED RIVER NEAR WAYSIDE, TEXAS, FEBRUARY 6-9, 1968,
Geological Survey, Austin, Tex.
J. N. Lee, and M. L. Maderak.
Published and distributed by Texas Water Development Board, P. O. Box 12386, Austin, Texas 78711. Texas Water Development Board Report 116, May 1970. 11 p, 2 fig, 3 tab.

Descriptors: *Low flow, *Water quality, *Discharge (Water), *Solutes, *Texas, Streamflow, Chlorides, Saline water, Water chemistry, Texas.
Identifiers: Prairie Dog Town Fork Red River (Texas).

During the period February 6-9, 1968, water discharge in the Prairie Dog Town Fork Red River increased, in a downstream direction, from 0.19 cfs at a point 1 mile below Lake Tanglewood (site 1) to 2.11 cfs near Wayside, Texas (site 69), a river distance of 40.2 miles. Five reaches had significant gains, four had significant losses, three reaches had no flow, and numerous reaches had smaller gains and losses between individual sites. There were no releases from Lake Tanglewood during this period. The quality of water deteriorated progressively downstream. Dissolved solids increased from 468 mg/liter at site 1 to 8,330 mg/liter at site 69. The chloride concentration increased from 28 mg/liter to 3,300 mg/liter. (Knapp-USGS)

TIME OF TRAVEL OF TRANSLATORY WAVES ON THE BRAZOS, LEON, AND LITTLE RIVERS, TEXAS,
Geological Survey, Austin, Tex.
Willard B. Miils.
Published and distributed by Texas Water Development Board, P. O. Box 12386, Austin, Texas 78711. Texas Water Development Board Report 115, April 1970. 14 p, 11 fig, 4 tab, 6 ref.

Descriptors: *Streamflow, *Flood routing, *Hydrographs, Texas, Recession curves, River forecasting, Runoff, Hydrography analysis, Water level fluctuations, Water levels.
Identifiers: Flood waves, Brazos River, Leon River, Little River (Texas).

Travel times of peaks for the 346.4-mile reach of the Brazos River between Whitney and Richmond varied from 213 hours at 1,000 cfs, to 92 hours at 40,000 cfs, to 168 hours at 100,000 cfs. Minimum travel time of peaks for the 82-mile reach between Leon River near Belton and Little River at Cameron varied from 57 hours for initial flow less than 15 cfs at Belton to 42 hours for initial flow above 200 cfs at Belton. Minimum travel time of peaks for the 65-mile reach between Little River at Cameron to Brazos River near Bryan varied from 30 hours for 1,000 cfs, to 22 hours for 3,500 cfs, to 25 hours for 65,000 cfs, to 34 hours for 134,000 cfs. Travel time was not consistent for any discharge, and was even more inconsistent in the low discharge range. Minimum peak travel time for each channel condition was fairly well defined. (Knapp-USGS)

BASE-FLOW RECESSION CHARACTERISTICS AND SEASONAL LOW-FLOW FREQUENCY CHARACTERISTICS FOR MISSOURI STREAMS,
Geological Survey, Rolla, Mo.
John Skelton.
Missouri Geological Survey and Water Resources, Water Resources Report 25, July 1970. 43 p, 5 fig, 9 ref, 2 append.

Descriptors: *Base flow, *Recession curves, *Frequency analysis, *Missouri, Streamflow forecasting, Water utilization, Duration curves, Depth-area-duration analysis.
Identifiers: Low-flow frequency (Missouri).

This report presents the results of a hydrograph analysis of base-flow recessions and a statistical study of seasonal low-flow information for Missouri streams. Base-flow recession characteristics of 116 continuous and partial-record stations and seasonal low-flow frequency information for 215 continuous and partial-record stations are presented. Base-flow recession characteristics for the growing season (May through October) were determined for average and maximum depletion rates from gaging station hydrographs. Points of transition between storm and base-flow recessions, as determined by the intersection of trend lines through storm and base-flow recession data ranged from 50to 90-percent duration on station flow-duration curves. Seasonal low-flow frequency information was computed from annual June through August minimums to provide low-flow frequency data for the irrigation season. The average ratio of seasonal to annual low-flow frequency events for the 7-day period is about 1.5:1 for the Springfield Plateau, 2.1:1 for the Southeastern Lowlands, 3.2:1 for the Till and Osage Plains, and 1.1:1 for the Salem Plateau. (Knapp-USGS)
W70-10235

THE HYDROLOGY OF FOUR STREAMS IN WESTERN WASHINGTON AS RELATED TO SEVERAL PACIFIC SALMON SPECIES,
Geological Survey, Tacoma, Wash.
M. R. Collings, Ronald W. Smith, and G. T. Higgins.
US Geological Survey Open-file Report 1970. 158 p, 75 fig, 16 tab, 14 ref.

Descriptors: *Streamflow, *Salmon, *Spawning, *Fish conservation, *Washington, Water conservation, Anadromous fish, Commercial fishing, Sport fishing, Aquatic habitats, Environment, Ecology.
Identifiers: Salmon conservation.

Enhancement or even preservation of the Pacific Salmon hinges on the careful planning and proper management of the streamflow upon which they depend for spawning purposes. A method of determining preferred spawning conditions and the results of the investigation of 129 measurements on 14 study reaches of the Dewatto, Cedar, Kalama, and North Fork Nooksack Rivers are presented. Water depth and velocities were measured to designate, from area- (spawnable) discharge curves, peak preferred spawning flows for fall chinook, spring chinook, sockeye, and coho salmon at each reach on each river. Also, streambed gravels, water temperature, suspended sediment, dissolved oxygen, and specific conductance are used to help evaluate river conditions during spawning. Peak spawning discharges ranged, for the four salmon species on each of the three study reaches of each river, from 50 to 140 cfs (cubic feet per second) on Dewatto River, from 230 to 510 cfs on Cedar River, from 245 to 800 cfs on Kalama River, and from 195 to 710 cfs on North Fork Noosack River. (Knapp-USGS)
W70-10240

ESTIMATED MEAN-ANNUAL RUNOFF AT POST HEADQUARTERS AREA, WHITE SANDS MISSILE RANGE, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
Arthur G. Scott.
US Geological Survey Open-file report, July 1970. 13 p, 3 fig.

Descriptors: *Runoff, *Stream gages, *New Mexico, *Regression analysis, Statistical methods, Water yield, Rainfall-runoff relationships, Water resources development, Water supply.
Identifiers: White Sands Missile Range (N Mex).

Three different methods of estimating long-term mean-annual runoff were tried in the White Sands Missile Range Headquarters area. Two were considered unsuccessful--a channel geometry method, and a precipitation-altitude relation. Calculations of runoff based on the graphical regression of annual precipitation against annual runoff results in the best estimate possible with the data available. Mean-annual runoff in the drainage area of about 81 square miles is about 69 acre-feet. The standard error for this calculation, based on eight station-years of record, is about 12 percent. An additional error is introduced by projecting data from gaged sites to ungaged sites. The estimated mean-annual runoff value can be better defined and the error reduced by gaging other sites in the Post Headquarters area and by the use of longer periods of record. (Knapp-USGS)

WATER RESOURCES OF THE REDWOOD RIVER WATERSHED, SOUTHWESTERN MINNESOTA,
Geological Survey, Washington, D.C.
W. A. Van Voast, L. A. Jerabek, and R. P. Novitzki
For sale by US Geological Survey, Washington, DC. Price $1.75 per set. US Geological Survey Hydrologic Investigations Atlas HA-345, 3 sheets, 1970. Text, 35 fig, 5 tab, 8 ref.

Descriptors: *Water resources, *Minnesota, Surface waters, Groundwater, Water quality, Recreation, Municipal water, Irrigation water, Water resources development, Lakes, Streamflow, Floods, Aquifers.
Identifiers: Redwood River (Minn).

The water resources of the Redwood River watershed, Minnesota are described in a 3-sheet hydrologic atlas consisting of maps, geologic cross sections, block diagrams, graphs, and tables. Total water use in the watershed is less than 5 percent of the average flow of the Redwood River at Redwood Falls. Over 90 percent of the withdrawals are from groundwater sources. There is good potential for developing both ground- and surface-water sources to meet several times the current demands. Municipal supplies in the watershed are from groundwater. Most municipalities would have little trouble increasing supplies by drilling additional wells. However, water is hard to very hard and generally exceeds the recommended limits for iron and manganese. The suitability of water from a particular source depends upon the intended use. Factors contributing to the desirability of certain waters include the quantity available, the accessibility of the source, and the physical and chemical characteristics of the water. (Knapp-USGS)
W70-10253

HYDROLOGIC RECONNAISSANCE OF THE TANANA BASIN, CENTRAL ALASKA,
Geological Survey, Washington, D.C.
G. S. Anderson.
For sale by U S Geological Survey, Washington, D C - Price $2.00 per set. U S Geological Survey Hydrologic Investigations Atlas HA-319, 4 sheets, 1970. Text, 20 fig, 4 map, 7 tab, 46 ref.

Descriptors: *Hydrogeology, *Water resources, *Alaska, Permafrost, Groundwater, Surface waters, Streamflow, Aquifers, Water yield, Water resources development, Glaciers, Freezing, Runoff, Discharge (Water), Water quality.
Identifiers: Tanana Basin (Alaska).

The Tanana basin in interior Alaska covers approximately 44,500 square miles with 576 square miles of its headwaters in Canada. This report is intended to define in broad terms the hydrology of the Tanana basin. Although basic data are limited, sufficient information is available to formulate a framework for further collection of basic data, preliminary development planning, and identification of problems. The Tanana basin is entirely within the discontinuous permafrost zone of Alaska. Groundwater in the Tanana basin occurs under unconfined and artesian conditions. Unconfined groundwater generally is found in unconsolidated alluvium in the valleys and in fractured bedrock beneath high slopes and ridges. Artesian conditions generally occur in the lower slopes where permeable beds are confined by permafrost or by impermeable sedimentary beds. Along the lower hillslopes, flowing artesian wells are common. The thermal effects of water exert a dominant control on the permafrost regimen. Deeper lakes and rivers and the circulation of groundwater cause the degradation of permafrost and limit its distribution both vertically and areally. The average streamflow of the Tanana River near its mouth is estimated as 37,000 cfs. Approximately 85% of this discharge originates in the Alaska Range; approximately 50% of the discharge is contributed by 4 tributaries from the south side, the Kantishna, Nenana, Nabesna, and Delta Rivers. (Knapp-USGS)

ANNOTATED BIBLIOGRAPHY ON HYDROL GY AND SEDIMENTATION 1966-19 UNITED STATES AND CANADA.
Water Resources Council, Washington, D.C.

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C, 20402 - Price $5.25. Water Resources Council, Joint Hydrology-Sedimentation Committees Bulletin 10, July 1970. 613 p.

Descriptors: *Bibliographies, *Abstracts, *Hydrology, *Sedimentation, Water resources, Water chemistry, Water quality, Groundwater, Surface waters, Hydrogeology, Water utilization, Snow, Runoff, Meteorology, Flow, Floods, Forests, Hydrologic budget.

This bibliography of over 7,000 references is a guide to literature on hydrology and sedimentation for the use of Government agencies and the public. Efforts were made to cover all such literature published in the United States and Canada during 1966-1968. The index of the bibliography covers both place and subject. In the United States and Canada, the smallest geographical subdivisions used are states and provinces. Elsewhere, geographical subdivision is by country. For papers applying to areas larger than the smallest subdivision, entries are listed under major river basins in the United States and by continents for the rest of the world. Secondary listings have been used where a paper is of a scope clearly exceeding the one subject listing. (Knapp-USGS)

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402. U S Geological Survey Water-Supply Paper 1924, 1970. 488 p, 1 fig, 1 plate.

Descriptors: *Surface waters, *Streamflow, *Flow measurement, *Gaging stations, Flow rates, Average flow, Low flow, Lakes, Reservoir stages.
Identifiers: *Colorado River basin, *Basic data, Stream discharge, Flow extremes, Crest stage.

This volume, Surface Water Supply of the Colorado River Basin Above Green River, is one of a series of 37 reports presenting records of stage, discharge, and content of streams, lakes, and reservoirs in the United States during the 1961-65 water years. The data reported comprise a description of the gaging station, and tables showing the daily, monthly, and yearly discharges of the stream. The description of the station gives the location drainage area, records available, type and history of gage, average discharge, extremes of discharge, and general remarks. For most gaging stations on lakes and reservoirs the data presented comprise a description of the station and a monthly summary table of stage and contents. Data for partial-record stations are presented in two tables. The first is a table of discharge measurements at low-flow partial-record stations, and the second is a table of annual maximum stage and discharge at crest-stage stations. (See also W70-10320) (Woodard-USGS)

LAND CAPABILITY: A HYDROLOGIC RESPONSE UNIT IN AGRICULTURAL WATERSHEDS,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
Charles B. England.
USDA-ARS 41-172, Sept 1970. 12 p, 4 tab, 1 illus, 18 ref.

Descriptors: *Streamflow, *Runoff, *Watersheds (Basins), *Hydrologic properties.
Identifiers: Ralston Creek, Iowa, land capability classes, hydrologic soil grouping.

Understanding the hydrology of agricultural watersheds requires a knowledge of the spatial distribution of runoff-contributing and runoff-absorbing areas and their relation to each other. Soil surveys, interpreted into land-capability groupings, can provide a tool for assessing spatial distribution, and thus appear to offer promise as a serviceable and, fortunately, already established hydrologic soil grouping. Land-capability classes are based on the same soil-landform criteria as those used in hydrologic soil groupings: surface moisture capacities and position on the landscape. In addition, land-capability classes are intuitively unique in land use and provide a basis for futuristic estimates of land use as well as hydrologic performance. This concept is exploratory and is offered here as an inducement for discussion and, hopefully, further testing. (England-USDA-ARS)

NICHOLS V CITY OF MORRISTOWN (LIABILITY FOR INJURY DUE TO INADEQUACY OF CREEK TO ACCOMMODATE SURFACE WATER).

263 NW 900-901 (Minn 1935).

Descriptors: *Minnesota, *Surface drainage, *Rainfall-runoff relationships, *Overflow, Cities, Tiles, Tile drains, Tile drainage, Surface waters, Surface runoff, Creeks, Outlets, Rain, Rainfall, Snowmelt, Judicial decisions, Legal aspects, Damages, Remedies.

Plaintiff sought damages for injury to his property caused by the overflow of a creek. Plaintiff contended the overflow was due to the negligent laying of drainage tile by defendant city. Defendant contended the overflow was caused by the fact that the creek could not accommodate the surface water that was produced by melting snow and heavy rains. Based on the testimony and other evidence of record, the court ruled that plaintiff had no cause of action due to any negligent or improper conduct on defendant's part. The judgment for defendant was affirmed. (Price-Florida)

MODEL STUDIES OF TIDAL EFFECTS ON GROUNDWATER HYDRAULICS,
Hawaii Univ., Honolulu. Water Resources Research Center.
John A. Williams, Ronald N. Wada, and Ru-yih Wang.
Available from NTIS as PB-194 353, $3.00 in paper copy, $0.65 in microfiche. Hawaii University Water Resources Research Center Technical Report No 39, May 1970. 80 p, 21 fig, 4 tab, 4 append. OWRR Project A-015-HI (1).

Descriptors: *Tidal effects, *Water level fluctuations, *Model studies, *Groundwater, Groundwater movement, Porous media, Computer programs, Mathematical models, Analog models, Hydraulic models.
Identifiers: Groundwater-tidal relationships.

A model study was made of the propagation of periodic fluctuations in the piezometric head through a saturated porous media. Three different models were employed: a hydraulic model, a mathematical model, and an electrical analog model. The hydraulic model consisted of one or more layers of polyurethene foam placed in a lucite tank. The foam was tested in a confined and unconfined condition using both a no-flow and a constant-head boundary condition at the internal boundary. The mathematical and electric analog models duplicated the conditions in the hydraulic model. The diffusion theory can describe the propagation of such distrubances provided that the boundary conditions are satisfied and that the correct diffusion coefficient is employed. The calculation of the correct diffusion coefficient requires that an appropriate storage coefficient and an apparent porosity be used for the confined and unconfined models, respectively. For the unconfined case, the ratio of the apparent porosity to the true porosity is of the same order of magnitude for both the polyurethene foam and a Sacramento River sand. (Knapp-USGS)

OPTIMAL PLANNING OF A COASTAL COLLECTOR,
Technion-Israel Inst. of Tech., Haifa; and Water Planning for Israel Ltd., Tel-aviv.
M. Shechter, and J. Schwarz.
Research supported by grants from US Dept of Agriculture and TAHAL, Water Planning for Israel. Water Resources Research, Vol 6, No 4, p 1017-1024, August 1970. 8 p, 3 fig, 3 tab, 8 ref.

Descriptors: *Water resources development, *Water yield, *Mathematical models, *Optimization, Water levels, Pumping, Withdrawal, Groundwater movement, Saline water-freshwater interfaces, Saline water intrusion, Hydrogeology.
Identifiers: *Well fields, Israel, Coastal aquifers.

The optimal design of a collector using seaward groundwater flow in a coastal aquifer is obtained by analyzing the interrelated hydrologic, engineering, and economic aspects of the project. The optimal size of the project determines the pumping rate and the pumping policy, as well as the location of the wells in relation to the coast. A model of the relevant hydrologic relationships in the aquifer uses a criterion for economically efficient utilization of the aquifer, estimates the model parameters, and determines an optimal project size. GENERAL HYDROLOGY OF THE MIDDLE GULF AREA, FLORIDA,
Geological Survey, Tallahassee, Fla.
R. N. Cherry, J. W. Stewart, and J. A. Mann.
Florida Bureau of Geology Report of Investigation No 56, Department of Natural Resources, 1970. 96 p, 45 fig, 4 tab, 34 ref.

Descriptors: *Hydrogeology, *Water resources, *Florida, Hydrologic budget, Groundwater, Surface waters, Springs, Groundwater movement, Streamflow, Aquifers, Water supply, Water utilization.
Identifiers: Middle Gulf Area (Fla).

The Middle Gulf area in the west-central coast of peninsular Florida encompasses about 1,700 sq mi. The area is drained principally by the Crystal, Homosassa, Chassahowitzka, Weekiwachee, Pithlachascotee and Anclote Rivers and Cypress Creek. The average daily discharge from thearea for the period January 1964-June 1966, was 2,300 cfs. No permanent regional declines in surface or groundwater levels have occurred in the area. Principal outflow from the hydrologic system is evapotranspiration which amounts to about 67% of the total outflow. Runoff amounts to about 32% and direct groundwater outflow to the sea is about 1%. Rainfall averages about 55 inches annually. Eighty percent of the runoff from the area originates either as spiringflow or seepage to streams from the Floridan aquifer. The water-level gradients in the system are about the same as the topographic gradients (2-3 ft/mi). Water levels are highest in late summer or early fall following the rainy season and are lowest in late May or early June. The chemical quality of ground and surface water is good. Ample supplies of good quality water are available for existing and foreseeable uses. (Knapp-USGS)

INTERFERENCE BETWEEN GRAVITY WELLS STEADY STATE FLOW,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
Abdel-Aziz I. Kashef.
Water Resources Bulletin, Vol 6, No 4, p 617-630, July-August 1970. 14 p, 2 fig, 1 tab, 12 ref.

Descriptors: *Groundwater movement, *Drawdown, *Water level fluctuations, *Steady flow, Dupuit-Forchheimer theory, Mathematical studies, Water table, Porous media, Well spacing.
Identifiers: Well interference.

Under steady state conditions of flow, seepage toward a single gravity well is governed by the Laplace Equation, which may be written in terms of either the hydraulic head, the pressure head, or the velocity potential. Although this equation is linear, the principle of superposition cannot be applied to sum up the individual effects in the case of a multiple gravity well system because of the variation of the flow domain under the effect of one or several wells. A method is presented allowing the use of the superposition principle in a restricted form. Decrements of the base pressure heads are superposed on initial heads before pumping. Decrements in the areas of the pressure head diagrams across specific vertical sections can be summed up. (Knapp-USGS)

INVESTIGATION OF GROUNDWATER FLOW WITH RADIOCARBON,
Groningen Rijksuniversiteit (Netherlands).
J. C. Vogel.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/24, p 355-369, 1967. 15 p, 7 fig, 5 tab, 2 ref.

Descriptors: *Groundwater movement, *Radioactive dating, *Carbon radioisotopes, Flow velocity, Recharge, Aquifers, Surface-groundwater relationships, Tracers, Tracking techniques, Stable isotopes, Radioisotopes, Radioactivity techniques.
Identifiers: Netherlands.

Radiocarbon dating of groundwater may be used for deduction of recharge rates of aquifers. The relationships between the age at a point in the water-body and the recharge depends on whether the aquifer is confined or unconfined. For an unconfined aquifer receiving recharge over the whole surface area a simple relationship is deduced. Such an aquifer can be characterized by its age at half-depth. Natural radiocarbon has been used to study flow patterns and flow-rates of subterranean waterbodies in the Netherlands. The deep groundwater in the south-east region of the Usselmeer presents a complicated situation caused by the inhomogeneity of the strata. Flow-rates are therefore not so readily deduced, but the different aquifers can be distinguished by using the isotopes C-14, C-13 and O-18 as natural tracers. In the province of Friesland the deep groundwater shows a more consistent picture with flow times of several thousand years corresponding to quite acceptable flow-rate of around 10 m/yr. (Knapp-USGS)

NATURAL TRITIUM IN GROUNDWATER STUDIES,
Iceland Univ., Reykjavik.
P. Theodorsson.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/26, p 371-380, 1967. 10 p, 7 fig, 1 tab, 6 ref.

Descriptors: *Water chemistry, *Tritium, *Fallout, Radioisotopes, Groundwater movement, Tracers, Tracking techniques, Water analysis, Thermal springs, Thermal water.
Identifiers: Iceland.

Since 1952 large quantities of tritium have been injected into the atmosphere from tests with thermonuclear weapons and large variations in the tritium concentrations of rain have occurred. These variations are reflected in groundwater in different ways depending on the history of the water. Therefore, tritium measurements can give valuable information about groundwater dydrology. Rain, river water, groundwater and geothermal water from various localities in Iceland have been sampled since 1960, and routine measurements of tritium have been carried out since 1963. The paper reports the tritium concentration of thermal water from major geothermal areas in Iceland together with some measurements on other groundwater systems. (Knapp-USGS)

Identifiers: Vienna Basin (Austria).

Monthly analyses of tritium from 22 sources
groundwater of the Vienna Basin have been ma
since April 1965 with a view to elucidating
complex groundwater-surface water relations a
ascertaining the movement of groundwaters. T
sources are classified broadly into four groups:
Nonthermal springs including karst springs of
bordering mountains; (2) thermal springs ris
along faults that border the floor of the Vie
Basin; (3) wells on the floor of the Basin; and
large groundwater overflows on the floor of
Basin. All groundwater sampled showed the eff
of local recharge by high tritium precipitation
the exceptionally wet summer of 1965. Grou
water overflows thought to represent dischar
from the main groundwater reservoir w
generally higher in tritium than other groundwat

indicating rapid shallow circulation from nearby streams. Thermal springs believed representative of deep circulation all showed the effect of mixing with shallow waters recharged from current precipitation. The highest tritium contents in well waters were from the upper part of the Basin where water levels are very deep and streams lose water in crossing the alluvium. Samples taken during drilling of a deep exploratory well show a decrease in tritium with depth, but even at 140 m depth the tritium content was 13 T. U. indicating relatively rapid circulation throughout the principal aquifer. (Knapp-USGS)

L. H. Baetsle, and J. Souffriau.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/41, p 617-628, 1967. 12 p, 4 tab, 8 ref.

Descriptors: *Tracers, *Tracking techniques, *Groundwater movement, *Hydrogeology, Aquifers, Sands, Sandstones, Instrumentation, Data processing, Dispersion, Diffusion, Mixing, Velocity, Adsorption.
Identifiers: Tracer dispersion.

Design principles for injections of radioactive trace substances into homogeneous aquifers are outlined. If the radiotracer is not absorbed by the solid phase the pulse shape has a symmetric form that may be described mathematically by the classical diffusion equations. The magnitude of the dispersion coefficients and their determination are discussed in detail. The leading and trailing parts of the distribution curve may be considered as forming part of two different normal distributions with two dispersion coefficients. An example of this approach is out in detail. The asymmetric pulse-shape can be described analytically as a homogeneous concentration/distribution curve, but the computation method is very complicated. Some limitations of this approach are discussed from the fundamental as well as from the computation point of view. (Knapp-USGS)

THE STORAGE COEFFICIENT AS A FUNCTION OF WATER TABLE CELERITY,
Washington State Univ., Pullman. Dept. of Civil Engineering.
David T. Higgins, and Cheng-Nan Lin.
Available from NTIS as PB-194 458, $3.00 in paper copy, $0.65 in microfiche. Completion Report, August 1970. 41 p, 14 fig, 4 tab, 10 ref, 4 append. OWRR Project A-029-WASH (1).

Descriptors: *Storage coefficient, Specific yield, Unsteady flow, Transient flow, *Drainage, *Drawdown, *Water table.

Many analyses of unsteady water table drawdown lead to inaccurate results near the outflow face at early time. They suffer from the assumption that the yield of drainable water is immediate and complete, as is that of confined aquifers. That assumption is true only for slow rates of drawdown. For rapid drawdown a better assumption is required. It is hypothesized that the rate of gravity drainage varies inversely with the rate of water table drawdown. The hypothesis was disproved in tests of vertical sand column drainage. Over the range of variables tested the drainage increased with water table celerity and showed multiple values. The parameter was the rate of pressure drop at the column base. A computer simulation of the problem was devised which closely reproduced the experimental results. Another approach to the problem was taken. For a given rate of change of base pressure the column drainage approaches an asymptotic value. Normalized asymptotic drainage-pressure drop data for several sand sizes plotted as a single curve. A simple exponential equation approaches that function. A modification of this equation is proposed which is based on the similarities between stream tubes in aquifers and the vertical sand column. It is recommended that application of the modification to multidimensional drawdown problems be pursued.

WATER RESOURCES OF NORTHEAST FLORIDA (ST. JOHNS RIVER BASIN AND ADJACENT COASTAL AREAS),
Geological Survey, Tallahassee, Fla.
L. J. Snell, and Warren Anderson.
Florida Bureau of Geology Report of Investigation No 54, Department of Natural Resources, 1970. 77 p, 34 fig, 9 tab, 21 ref.

Descriptors: *Groundwater, *Florida, *Hydrogeology, Water resources, Water resources development, Aquifers, Water wells, Artesian wells, Water levels, Data collections, Hydrologic data.
Identifiers: Groundwater resources, St. Johns River basin (Fla).

This report summarizes and appraises the water resources of the St. Johns River basin and the adjacent narrow coastal strip of northeast Florida. The area contains about 11,200 square miles and has about one-quarter of Florida's population. The report provides information on the occurrence, availability, chemical quality, and use of surface and underground waters as a guide for public and private agencies for planning the most beneficial development of the water resources of the area, to recognize areas of excess and deficient water, areas of good and poor quality waters, and areas where further detailed investigations are desirable. Population growth and economic expansion create the need for additional water supplies either from present sources or from new sources. Ample quantities of good quality water are available to meet foreseeable water needs. Water withdrawn from surface and groundwater sources is less than 10 percent, and that consumed is less than 5 percent of the estimated available supply exclusive of saline waters used for cooling in electric power generation. Most sources of readily available good quality water are in the western parts of the report area and the centers of greatest demand are along the Atlantic coast. (Grossman-USGS)
W70-10239

THEORY OF DISPERSION IN A GRANULAR MEDIUM,
Geological Survey, Washington, D.C.
Akio Ogata.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price 45 cents. US Geological Survey Professional Paper 411-I, 1970. 34 p, 21 fig, 53 ref.

Descriptors: *Dispersion, *Porous media, Groundwater movement, Water chemistry, Path of pollutants, Adsorption, Mathematical studies, Saline water-freshwater interfaces, Saline water intrusion, Equations, Diffusion, Mass transfer, Mixing.
Identifiers: Dispersion in granular media.

Theoretical aspects of investigations and a few confirmatory laboratory studies of the dispersion process are discussed. The basic assumptions associated with the development of the dispersion equation, based on the applicability of a heuristic expression similar to Fick's law, are described. In general, these assumptions limit its application to a homogeneous medium in which the dispersion process is anisotropic. Several solutions are given for the differential equation that approximates the dispersion process. The equations approximating dispersion in a two-fluid system (salt-fresh water) are also presented. (Knapp-USGS)

EMPIRICAL RELATIONS IN PROPERTIES OF UNCONSOLIDATED QUARTZ SANDS AND SILTS PERTAINING TO WATER FLOW,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia); and Australian Atomic Energy Commission Research Establishment, Lucas Heights.
William A. Wiebenga, W. R. Ellis, and L. Kevi.
Water Resources Research, Vol 6, No 4, p 1154-1161, August 1970. 8 p, 6 fig, 2 tab, 9 ref.

Descriptors: *Groundwater movement, *Dupuit-Forchheimer theory, *Tracers, Hydrogeology, Particle size, Porosity, Radioisotopes, Permeability, Velocity, Flow, Specific yield, Sediments, Aquifers, Laboratory tests, Hydraulic conductivity.
Identifiers: Sorting coefficient.

During a laboratory investigation using radiotracers, empirical formulas were developed to replace the ambiguous or incorrect Dupuit-Forchheimer assumption used in relationships governing the flow of water through porous, unconsolidated materials ranging from clay to coarse sands or fine gravels. The Dupuit-Forchheimer assumption states that the ratio of specific flow rate to average flow velocity is equal to porosity, but it is not specified whether true porosity or void ratio or specific yield, also called effective porosity, is meant. The hydraulic conductivity shows a good correlation with the maximum 10% grain size, and the ratio of specific flow rate to average flow velocity shows good correlation with functions of specific yield and percentile sorting coefficient. From field measurements of specific flow rate and average flow velocity the specific yield can be computed. (Knapp-USGS)
W70-10245

LITHOLOGIC CONTROLS ON THE DEVELOPMENT OF SOLUTION POROSITY IN CARBONATE AQUIFERS,
Pennsylvania State Univ., University Park.
Henry W. Rauch, and William B. White.
Water Resources Research, Vol 6, No 4, p 1175-1192, August 1970. 18 p, 14 fig, 6 tab, 15 ref. OWRR Project A-005-PA.

Descriptors: *Karst, *Pennsylvania, *Porosity, *Water chemistry, *Carbonate rocks, Caves, Geochemistry, Limestones, Dolomite, Drainage effects, Geomorphology, Groundwater movement, Subsurface drainage, Rock properties.
Identifiers: Solution porosity.

Movement of groundwater in maturely karsted limestone aquifers is commonly through solution conduits of considerable size. The volume of all accessible caves more than 100 feet in length in the Nittany Valley area of central Pennsylvania was measured. Most caves are entirely within limestones. Cave development in dolomite is extremely rare. Within the limestone sequence the bulk of the cave volume is concentrated in a few members. Chemical and petrographic analyses of the carbonate rocks were associated with cave volume by bar graphs and components analyses. The more cavernous limestones seem to be those with low amounts of dolomite, clay, and other impurities, and a high micrite grain fraction. Coarse limestones and dolomites are less cavernous. (Knapp-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF THE GRAND RAPIDS AREA, NORTH-CENTRAL MINNESOTA,
Geological Survey, Washington, D.C.
Edward L. Oakes.
For sale by US Geological Survey, Washington, DC - Price $1.50 per set. US Geological Survey Hydrologic Investigations Atlas HA-322, 2 sheets, 1970. Text, 8 fig, 2 map, 3 tab, 11 ref.

Descriptors: *Water resources, *Hydrogeology, *Minnesota, *Mississippi River basin, Aquifers, Glacial drift, Lakes, Reservoirs, Mississippi River, Water yield, Groundwater movement, Water quality, Permeability, Transmissivity, Geology.
Identifiers: Grand Rapids (Minn).

This 2 sheet Hydrological Atlas is one of a series of studies of geology and groundwater availability conducted in and near selected communities on the Mesabi Iron Range, north-central and northeastern Minnesota. This report describes the geology and groundwater conditions in the 303 square-mile Grand Rapids area. Sheet 1 is designed for use by anyone interested in the geology and occurrence of groundwater in the geologic units of the area. Sheet 2 is designed to be used by hydrologists and engineers who have the responsibility for major groundwater development in the area. The Grand Rapids area is drained by the Mississippi and Prairie Rivers. Pokegama Lake is a reservoir formed by a dam on the Mississippi River. Prairie Lake is formed by a dam on the Prairie River. The area also contains many natural lakes and swamps which provide excellent fish and wildlife habitat. Groundwater supplies may be obtained from glacial drift and from Precambrian metasedimentary (Animikie) rocks. The best source of groundwater is from buried outwash in the glacial drift. Regional groundwater movement is toward the Mississippi and Prairie Rivers. Groundwater may be very hard and high in iron and manganese. (Knapp-USGS)

GROUNDWATER GEOLOGY OF THE ROCK ISLAND, MONMOUTH, GALESBURG, AND KEWANEE AREA, ILLINOIS,
Illinois State Geological Survey, Urbana.
John E. Brueckmann, and Robert E. Bergstrom.
Illinois Geological Survey Report of Investigations 221, 1968. 56 p, 14 fig, 3 tab, 44 ref, append.

Descriptors: *Hydrogeology, *Illinois, Groundwater, Water resources, Water resources development, Water wells, Aquifers, Water utilization, Groundwater movement, Water yield, Water quality, Data collections, Hydrologic data, Geology, Mississippi River basin.
Identifiers: Rock Island (Ill).

Groundwater in the Rock Island, Monmouth, Galesburg, and Kewanee area, Illinois, is obtained from (1) sand and gravel aquifers within the glacial drift; (2) shallow bedrock aquifers that are primarily dolomite of the Niagaran Series (Silurian) and the Keokuk-Burlington Limestone (Mississippian); and (3) deep bedrock aquifers, primarily the Ordovician Ancell Group (Glenwood-St. Peter Sandstone) and the Cambrian Ironton-Galesville Sandstone. Most private water supplies are obtained from the shallow bedrock aquifers, whereas the larger municipal supplies generally are obtained from the deep bedrock aquifers. Sand and gravel aquifers are sparsely distributed in the area. The estimated total pumpage of groundwater alone is 16,531,000 gallons per day for the area. This constitutes about 50% of the estimated total pumpage of both surface and groundwater and serves about 63% of the population. Municipalities now using groundwater can probably develop additional groundwater sources to meet increased demands in the future. (Knapp-USGS)

MEASUREMENT OF THE MOLECULAR SIZE OF A SODIUM HUMATE FRACTION,
Geological Survey, Denver, Colo.
R. L. Wershaw, S. J. Heller, and D. J. Pinckney.
Advances in X-Ray Analysis, Vol 13, p 609-61 1970. 9 p, 2 fig, 11 ref.

Descriptors: *Humic acids, *X-ray analysis, *Particle size, *Molecular structure, Soil chemistry, Soil physical properties, Soil chemical properties.
Identifiers: Sodium humate, Molecular size.

As a first step in developing a soil humate classification system a fraction of sodium humate from a North Carolina soil was isolated and its molecular size was measured by small angle x-ray scattering. Most of the sodium humate fractions isolated by ion exchange and gel permeation chromatography have distinctly different infrared absorption spectra, which indicates that these fractions differ from one another in either their chemical structure or degree of polymerizations. Size measurements of one of these fractions by small angle x-ray scattering indicates that the fraction is made up either of molecules of two different sizes or of zones of molecules of a single size. OVEMENT AND STORAGE OF WATER IN ORTH CAROLINA SOILS,
orth Carolina State Univ., Raleigh. Dept. of Soil ience.
Fulton Lutz.
vailable from NTIS as PB-194 531, $3.00 in per copy, $0.65 in microfiche. North Carolina ate University Soil Information Series No 15, oril 1970. 29 p. OWRR Project No A-008-NC).

escriptors: *Soil water movement, *Soil physical operties, *North Carolina, Bulk density, Hydrau- conductivity, Permeability, Porosity, Storage pacity, Infiltration, Percolation.
entifiers: Coastal plain soils, Mountain soils, edmont soils.

The most important soil physical properties affecting the movement and storage of water in soils are given, including analyses for bulk density, total porosity, pore-size distribution, total and available water-holding capacity and hydraulic conductivity. Values are given for essentially all of the major soil series in North Carolina representing more than two-thirds of the total land area of the State. The hydraulic conductivity data are important for agricultural and urban uses of soils. Soils with extremely low hydraulic conductivities are unsuitable for septic tank installations because of poor drainage; those with extremely high hydraulic conductivities are unsuitable because of the danger of pollution. Information on the available and unavailable water-holding properties of soils is valuable from an agricultural standpoint, particularly to those who irrigate. Even if the degree of dryness of the soil is not accurately know, a good estimate of the amount of irrigation water needed can be obtained. (Grossman-USGS)

POST-IRRIGATION MOVEMENT OF SOIL WATER 2. SIMULTANEOUS REDISTRIBUTION AND EVAPORATION,
Wisconsin Univ., Madison.
W. R. Gardner, D. Hillel, and Y. Benyamini.
Water Resources Research, Vol 6, no 4, p 1148-1153, August 1970. 6 p, 6 fig, 9 ref. USDA Grant FG-Is-163.

Descriptors: *Soil water movement, *Evaporation, *Percolation, *Irrigation water, *Evaporation control, Water conservation, Nuclear moisture meters, Soil moisture meters, Laboratory tests, Evapotranspiration.
Identifiers: Soil water redistribution.

Water content measurements by gamma-ray attenuation were made on soil columns during simultaneous redistribution and evaporation following irrigation. Redistribution is shown to reduce evaporation, in some cases appreciably. For a deep irrigation the redistribution proceeds at a rate that is relatively independent of the evaporation process, as has been predicted from numerical solutions of the flow equation. Expressions are derived for obtaining an estimate of amount of reduction in evaporation due to redistribution when the redistribution rate is known. (Knapp-USGS)

REVIEW OF COLLAPSING SOILS,
California State Coll., Long Beach. Dept. of Civil Engineering.
John H. Dudley.
ASCE Proceedings, Journal of the Soil Mechanics and Foundations Division, Vol 96, No SM 3, Paper 7278, p 925-947, May 1970. 23 p, 14 fig, 3 tab, 43 ref.

Descriptors: *Soil compaction, *Soil water movement, *Consolidation, *Subsidence, Soil mechanics, Soil physical properties, Soil structure, Wetting, Moisture content, Moisture tension.
Identifiers: Collapsing soils.

Soils which collapse (undergo large consolidation) when unusual amounts of water are added to them exist in many places around the world. Contrary to the ideas of many observers these collapsing soils derive from many different soil forming processes. Although surface collapse of 15 ft has occurred, the usual amount is considerably less. These soils are of open structure and exist in nature at less than 100% saturation. The major soil materials are silt, sand, or gravel or any of their combinations. Water in tension is the general binding material. A small amount of clay is present in many cases. Other binding agents sometimes contribute. The amount and rate of collapse is a function of grain shape, grain size, existing moisture content, kinds and amounts of clay present, void ratio, adsorbed ions, etc. Maximum collapse occurs at optimum clay content (10% in one case) and moisture content (between 13% and 39%). Most of the collapse can occur before the soil reaches 100% saturation. Estimates of the magnitude of possible collapse derived from routine tests generally are compared to field results. GENESIS OF CARBONATE PAN IN ARID REGION OF RAJASTHAN,
Central Arid Zone Research Institute, Jodhpur (India).
B. B. Roy, P. C. Chatterji, and S. Pandey.
Annals of Arid Zone, Vol 8, No 2, p 181-187, September 1970. 4 fig, 12 ref.

Descriptors: *Carbonates, *Hardpan, *Soil moisture, *Caliche, *Soil profiles, Soil chemistry, Magnesium, Calcium, Impervious soils, Soil types, Soil density, Subsoil, Geology, Geomorphology, Arid lands, Sands.
Identifiers: *India, *Thar Desert, *Pans.

The carbonate or 'kankar' pan occurs in all deserts of the world, usually concealed some distance under the sand. Several theories of pan formation are reviewed and discussed. A small area of the Rajasthan Desert was investigated, relating soil profiles, pan depth, vegetation, geology, geomorphology, and moisture conditions. Rock weathering, followed by release of Ca and Mg due to the action of carbonic acid in infiltrating rainwater, and formation of precipitated carbonates lead to a sub-surface cementation. Thickness of the Rajasthan pans indicates a very long geological past. The soils above the pan are all transported and therefore do not contribute to the formation of the thick zones. Groundwater in pan regions is saline, which, combined with their impervious structure, severely limits cultivation potential. These conditions and the sparseness of existing vegetation, in turn, enhance environmental aridity. (Casey-Arizona)

NATURAL CONDITIONS IN THE SOUTHERN PART OF THE CASPIAN SEMIDESERT,
A. G. Doskach.
Trans. from Russian. In: Genesis and Classification of Semidesert Soils. Israel Scientific Publications, p 2-20, 1968. Translated for the National Science Foundation and the U.S. Department of Agriculture by the Israel Program for Scientific Publications.

Descriptors: *Semiarid climates, *Climatology, *Geographical regions, *Geomorphology, Geology, Alluvial channels, Quaternary period, Tertiary period, Sediments, Clays, Soils, Geologic time, Water resources, Flood plains, Dry seasons, Wet seasons, Petrography, Rivers, Sands.
Identifiers: *Soviet Union, *Caspian Semidesert, *Paleogeography, *Tectonic uplift, Interfluves, Terrigenous materials, Fluvia.

The Caspian semidesert is a sea level plain with vast waterless expanses, lying to the north of the Caspian Sea. Total annual solar radiation is 115-120 calories per square centimeter. Mean annual precipitation is 160-175 millimeters, while

evaporability, due to dry summer winds, reaches 1000 millimeters. Spring, from late March to May, is characterized by very low rainfall, luxuriant ephemeral flowering and snow melts which effect groundwater recharge. Summer lasts through October and is very hot and dry with frequent winds and sporadic rainfall. Steady rainfall occurs in autumn and winter is freezing with a usually persistent snow blanket. Geologically, the area is part of the Caspian tectonic depression and there is a prevalence of marine or lacustrine-marine environments interrupted by relatively short terrigenous phases. Areal geomorphology is a result of a history of periodic changes in Caspian Sea volume and large discharge fluctuations in the ancient Volga and Ural rivers. The southern semidesert is divided into 10 discernable natural physicogeographical regions, and their geology and geomorphology are described in detail. (Casey-Arizona)

SOIL WATER MOVEMENT AS AFFECTED BY DEEP FREEZING,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
Richard S. Sartz.
Soil Sci Soc Amer Proc Vol 33, No 3, p 333-337, May-June 1969.

Descriptors: *Soil water movement, *Frozen soils, *Gravitational water, *Hydrologic properties, *Infiltration, Moisture content, Percolating water, Permeability, Soil physics, Wisconsin.
Identifiers: Interflow.

Knowledge of water movement into and through frozen soils is needed for studying the hydrologic behavior of northern watersheds. Soil water was logged by the neutron method in both sandy and silty soils over four winters in southwestern Wisconsin. Bonded frost depth, which ranged from 8 to 120 cm at maximum penetration, was measured concurrently by frost probe or resistance blocks. Changes in soil water took place throughout much of the frost season, even with deep soil frost. One series of data showed that water may infiltrate and percolate through more than 60 cm of hard-frozen ground. However, frozen ground did impede percolation, causing a buildup of water in the frozen zone during spring melt. Although neutron readings increased at upper levels during the frost season, most of the increases could not be accounted for by decreases at lower levels. Thus, they appeared to result more from infiltration than from upward migration as reported by others. (Sartz-Forest Service)

EVOLUTION OF TRITIUM ACTIVITY IN THE SOUTH-WEST OF FRANCE (FRENCH),
Institute of Geology of the Aquitaine Basin, Bordeaux (France). Faculty of Sciences.
P. Leveque, M. Vigneaux, and J. Alvinerie.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/30, p 417-432, 1967. 16 p, 7 fig, 1 tab, 12 ref.

Descriptors: *Tritium, *Lakes, *Rain, *Groundwater, *Fallout, Water chemistry, Radioisotopes, Tracers, Clays, Sampling, Data collections, Hydrologic data.
Identifiers: France.

The tritium activity of rain, lake and underground waters has been under investigation in the Bordeaux area (south-west France) since 1964. The 250 or so analyses carried out show that changes in activity of rain water vary rather considerably, with a fairly marked over-all decrease over the period of about 30 months during which observations have been in progress. One of the lakes in the dunes along the coast of Aquitaine, Lake Cazaux, represents a special case by virtue of its hydrological and hydrodynamic features. The fact that this lake, with an area of about 60 sq km, has no notable source of supply other than precipitation makes it a seasonable integrator of the wide variations in the level of tritium activity in rainwater. A comparison with other lakes seems to confirm this hypothesis. There is a considerable lapse of time before periods of maximum rainfall are followed by an increase in the activity of surface water layers. The mean activities of some plants are similar to those found in the water of clays and the lake waters. (Knapp-USGS)

DIEL VERTICAL MOVEMENTS AND FEEDING OF UNDERYEARLING SOCKEYE SALMON AND THE LIMNETIC ZOOPLANKTON IN BABINE LAKE, BRITISH COLUMBIA,
Fisheries Research Board, Nanaimo (British Columbia). Biological Station.
David W. Narver.
Journal of the Fisheries Research Board of Canada, Vol 27, No 2, p 281-316, 1970. 17 fig, 4 tab, 19 ref.

Descriptors: *Diurnal, *Movement, *Sockeye salmon, *Limnology, *Zooplankton, Seasonal, Depth, Thermocline, Epilimnion, Copepods, Daphnia, Sampling, Nets, Trout, Trawling, Temperature, Light intensity, Diptera, Alaska, Fish, On-site data collections.
Identifiers: *Vertical distribution, *Feeding habits, Diel vertical movement, Juvenile sockeye salmon, Babine Lake (Canada), Bosmina coregc Heterocope septentrionalis, Daphnia longispi Echo-sounder technique, Salmo gairdneri, Pu seine, Diaptomus ashlandi, Chironomid.

A precise diel vertical movement of underyearl sockeye salmon was observed in Babine La (British Columbia). During early July to S tember, at about 1.5 hours after sunrise to hours before sunset, the young sockeye were in distinct layers at approximately 20 and 35 met each layer about 6 meters thick. About 1.5 ho before sunset the two layers began to ascend. 0.5 hour after sunset all fish were within 3 meter the surface, and during darkness were disper throughout the top 5-15 meters, with most below the thermocline. Soon after dawn the moved toward the lake surface, then descen rapidly to daytime depths. By early October behavior pattern changed and was temporally sociated with epilimnion cooling and decrease feeding intensity. Of zooplankton, only Bosm coregoni and Heterocope septentrionalis displa pronounced diel vertical movements. Bosmina habited surface waters during the day and w found most abundant at 12-21 meters at nig Heterocope inhabited the 21-30 meter depths d ing the day and surfaced at night. Young sock fed intensively in the evening near the surface at dawn prior to descent. (Jones-Wisconsin)

GROWTH OF PHYTOPLANKTON A VASCULAR AQUATIC PLANTS AT D FERENT NUTRIENT LEVELS,
Cornell Univ., Ithaca. Dept. of Botany.
H. F. Mulligan, and A. Baranowski.
Verhandlungen der Internationalen Vereinig fur Theoretische und Angewandte Limnologie, 17, p 802-810, 1969. 8 tab, 6 ref.

Descriptors: *Plant growth, *Phytoplankt *Aquatic plants, *Nutrients, Phosphorus, I ganic compounds, Nitrogen, Biomass, Sands, ygen, Alkalinity, Hydrogen ion concentration, bidity, Chlorophyll, Seston, Benthic fl Chlorophyceae.
Identifiers: *Vascular plants, Elodea canade Potamogeton crispus, Myriophyllum spicatum.

Greenhouse experiments to determine opti levels of organic nitrogen and phosphorus aquatic plant growth were conducted as basis establishing eutrophic conditions in ponds. Vari formulations, levels, and ratios of inorg nitrogen and phosphorus were applied to cultu of aquatic vascular plants (Myriophyllum spica var exalbescens, Potamogeton crispus and Elo canadensis) and freshwater phytoplankton pop tions (mostly Chlorophyceae) established in containing natural soil and water. Nutrient le applied ranged from 0.005 to 50 milligrams/ nitrogen and 0.005 to 5.0 milligrams/ phosphorus. The yields of experimental plants a five weeks growth were used as response indi Highest nutrient levels produced the phytoplankton growth while the lower le resulted in higher vascular plant yields. Filam tous algae grew best at intermediate nutrient le High yields of vascular plants never coincided large phytoplankton populations. At the hig nutrient levels, no vascular plant growth occur Of two inorganic phosphorus compounds ev ated, super-phosphate of lime produced the gre yields. Smaller differences were apparent am three inorganic nitrogen compounds. These suggest that future uncontrolled enrichment natural bodies of water will result in growth larger populations of phytoplankton at the expe of benthic macrophytes. (Jones-Wisconsin)

BLUE-GREEN ALGAL BLOOMS SASKATCHEWAN LAKES,
Saskatchewan Univ., Saskatoon.
U. T. Hammer.

Verhandlungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 116t125, 1969. 3 fig, 3 tab, 29 ref.

Descriptors: *Cyanophyta, *Lakes, Temperature, Phosphates, Sampling, Seasonal, Diatoms, Eutrophication, Nitrates, Sewage, Physiocochemical properties, Nutrients, Depth, Chemical properties, On-site investigations.
Identifiers: *Water blooms, *Blue-green algae, Saskatchewan (Canada), Morphometry, Qu'Appelle River (Canada), Asterionella formosa, Anabaena flos-aquae, Aphanizomenon flos-aquae, Stephanodiscus, Microcystis aeruginosa, Oscillatoria prolifica, Fragilaria, Ceratium hirundinella.

An attempt was made to establish the relationship of bloom-forming blue-green algae with various physical, chemical, and biological components of lake environments in southern Saskatchewan, emphasizing effects of water temperature and orthophosphate levels on the production of blue-green algae blooms. The nutrient levels clearly place the Qu'Appelle River lakes in the eutrophic category, however application of algal indicators is questionable. Clearly both water temperature and orthophosphate concentrations play important roles in determining the predominance of the kinds of blue-green algal species together with the extent of production of individual species. Other factors undoubtedly also play important roles, such as the mean depth of the lake and consequently the amount of mixing of bottom materials with the main water mass. This may, in fact, involve the organic materials which have been considered important to blue-green production. That these are not strictly necessary was demonstrated with Aphanizomenon. Anabaena flos-aquae had been grown in fresh water medium with inorganics only present. However, it appears likely that proximity with water churned up from the bottom by constant winds does have a beneficial effect on algal growth. (Jones-Wisconsin)
W70-10165

THE UTILIZATION OF FOOD BY THE ZOOPLANKTON FOR ITS GROWTH (IN RUSSIAN),
N. M. Kryuchkova.
Zhurnal Obshchei Biologii, Vol 30, No 4, p 418-425, 1969. 2 fig, 1 tab, 34 ref.

Descriptors: *Zooplankton, *Lakes, *Food chains, Aquatic populations, Foods, Growth rates, Environmental effects, Metabolism, Algae, Daphnia, Copepods, Food webs, Aquatic animals, Laboratory tests.
Identifiers: *Growth utilization coefficients, Food assimilation, Food consumption.

Solution of many problems pertinent to the biological cycle of water basins requires the knowledge of values characterizing the consumption of food by aquatic animals and utilization of consumed food in the processes of growth. A survey of related literature has indicated that the average coefficient of the growth utilization of consumed food (K-sub-1) for freshwater zooplankton is 21.6%, whereas the coefficient of utilization of assimilated food (K-sub-2) is 40%. The same coefficients for marine zooplankton are 25.4% and 39.2%, respectively. The coefficient of food assimilation by both freshwater and marine animals is approximately 60%. These values were obtained in laboratory trials. The species of algae, used as food, not always answered the requirements of the test animals. Therefore, under natural conditions the efficiency of food utilization may be higher than that observed in laboratories. (Wilde-Wisconsin)
W70-10166

MICROBIOLOGICAL PROCESSES OF IRON TRANSFORMATION IN A MEROMICTIC LAKE (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Mikrobiologii.
G. A. Dubinina, and Z. P. Deryugina.
Zhurnal Obshchei Biologii, Vol 30, No 5, p 602-610, 1969. 2 fig, 5 tab, 13 ref.

Descriptors: *Lakes, *Iron, Hypolimnion, Iron bacteria, Oxygenation, Mud, Nutrients.
Identifiers: *Meromictic lakes, *Ferrous iron, Lake Okha-Lampi (USSR), Lake Uzornoye (Western Karelia SSR), Gallionella ferruginea, Hydroxides.

The meromictic Lake Okha-Lampi ('Ornamental') in western Karelia exhibits near its bottom a highly increased concentration of ferrous iron, up to about 100 milliliter/liter. The oxygenated upper part of the iron-enriched zone harbors a very dense population of Gallionella ferruginea and other iron bacteria, comprising 50% to 75% of the entire bacterial population. The diffusion of the hypolimnion iron into the upper strata and its removal from the lake are precluded by bacterial transformation of ferrous compounds into the form of insoluble hydroxides. Consequently, the iron accumulates in mud deposits and benthic water layers. (Wilde-Wisconsin)

THE GENERAL ANALYSIS OF A EUTROPHIC SYSTEM,
Alberta Univ., Edmonton. Dept. of Zoology.
J. R. Nursall.
Verhandlungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 109-115, 1969. 2 fig, 2 tab, 18 ref.

Descriptors: *Eutrophication, *Analysis, *Lakes, Cyanophyta, Systems analysis, Physiocochemical properties, Seasonal, Geology, Phytoplankton, Scenedesmus, Antarctic, Thermodynamic behavior, Zooplankton, Biota, Ice, Temperature, Aquatic plants, Euglenophyta, Mysobacteria, Environment, Energy, Indicators, Water pollution effects, Water pollution sources.
Identifiers: Edmonton (Canada), Alberta kettle lakes, Astotin Lake (Canada), Aphanizomenon flos-aquae, Anabaena, Asterionella formosa, Cyclotella meneghiniana, Microcystis aeruginosa, Melosira italica, Nitzschia, Spaherocystis schroeteri, Schizothrix calcicola, Morphometry, Allochthonous material.

An ice-free lake exchanges matter with its environment; covered with ice the lake is a closed system. Major sources of matter for exchange in an open lake system are allochthonous material and organic production by biota; the latter representing a second open system exchanging with the first. The exchange between lake and its environment is unequal; more matter enters the lake from both sources than leaves it, which is the basis of eutrophication. It is enhanced by slowdown of material exchange (or increased rate of accumulation) during the closed period. Since exchange of energy and input of allochthonous material are both independent and unpredictable variables, the nature of the biota also varies unpredictably and contributes its matter inestimably. Biota is opportunistic and variable–predictable only under strongly definable limiting conditions. It follows that the nature and rate of eutrophication is unpredictable nor are biotic indicators reliable, except in special instances of definable rate of constant pollution. Periods of transition between open and closed phases are those of great heat energy loss by a lake system. The variable effects of these periods markedly affect the conditions of the succeeding phases, particularly the closed phase. (Jones-Wisconsin)

AN ASSESSMENT OF THE WAVE AGITATION IN THE SMALL BOAT BASIN AT THE CANADA CENTRE FOR INLAND WATERS,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
T. M. Dick, and J. Marsalek.
Canada Department Energy, Mines and Resources, Inland Waters Branch Technical Bulletin No 28, 1970. 61 p, 24 fig, 8 tab, 3 ref, append.

Descriptors: *Breakwaters, *Waves (Water), *Harbors, *Lake Ontario, Hydraulic models, Model studies, Coastal engineering, Coastal structures, Marinas.
Identifiers: Hamilton Harbor (Ontario).

The geometry of the small boat basin at the Canada Center for Inland Waters causes multiple reflections of any wave agitation which enters. Consequently, there is a limit to the amount that wave heights can be attenuated by a practical arrangement of additional breakwaters. Hydraulic model studies were made to determine the probability of dangerous wave conditions and the possibility of correcting the problem by constructing breakwaters. The occurrence of undesirable conditions will probably not exceed four days during the navigation season and the best scheme will still require special mooring arrangements for the worst storms. It is recommended that a buoy mooring system be installed but additional breakwaters should not be constructed until further experience is gained. (Knapp-USGS)

Identifiers: *Pans, *Kalahari desert, *Rhodesia, *Tadpoles.

The innumerable small pools and seasonal lakes formed during the rainy season in Central Africa are disappearing because of agriculture and public health control measures. Twelve shallow, representative pans in the Kalahari desert were sampled and analyzed for physico-chemical and biological data when full of water, drying, and dry. Temperatures fluctuated over an 18 degree daily range, and mud was cooler than surface water, offering animals shelter from the thermal stress. Macroscopic fauna from small invertebrates through amphibians were sampled, listed and analyzed for numbers and biomass. Gut content analyses and feeding trials enabled determination of food habits and subsequent construction of hypothetical food webs. Biological productivity was estimated at 2500 kilograms per hectare per year, which compares favorably to the productivity of shallow fish ponds in the same region. Organic matter and pollution were present according to the presence and amounts of animal dung and seasonal vegetation, which in turn determined faunal diversity and biomass. Tadpoles were exteremely numerous and were benthic detritus feeders. Polluted alkaline pools with tadpoles had the greatest biomass. The possibility is discussed of integrating pan productivity into African game ranching programs. (Casey-Arizona)

IN RE BD OF SUPERVISORS (DETERMINATION OF LAKE'S NATURAL WATER LEVEL BY A COURT).

276 Mich 591, 268 NW 750-752 (1936).

Descriptors: *Michigan, *Lakes, *Water levels, *Jurisdiction, Water measurement, Height, Flumes, Fluctuation, Variability, Water loss, Evaporation, Seepage, Inland waterways, Lake shores, Sea level, Elevation, Adjudication procedure, Judicial decisions, Legal aspects.

Appellee board of supervisors petitioned the circuit court for a determination of the natural height and level of the water of two inland lakes. The petition was based upon a state statute conferring jurisdiction in such matters on state circuit courts. Appellant village contested the petition. After hearing expert testimony, the circuit court entered its order fixing the level of the lakes. Appellant contended that the statute did not and could not confer the right to fix the water level of the lakes upon the circuit court. The Supreme Court of Michigan affirmed the circuit court's order, holding that the statute conferred jurisdiction upon the circuit court to determine the natural water level of the lakes. 2I. Water in Plants

INVASION OF THE AQUATIC HABITAT BY AMPHIBIOUS SPECIES OF POLYGONUM,
Virginia Polytechnic Inst., Blacksburg. Dept. of Botany.
Richard S. Mitchell.
Available from NTIS as PB-194 454, $3.00 in paper copy, $0.65 in microfiche. Project Completion Report, August 1970. 24 p, 3 fig, 4 ref. OWRR Project A-028-VA (1).

Descriptors: *Aquatic plants, *Amphibious plants, *Plant tissues, *Plant morphology, Aquatic weeds, Rooted aquatic plants, Vegetation regrowth, Tropisms, Epidermis, Foliar, Moisture stress, Growth chambers, Plant ecology, Smartweeds, Polygonum.

This report covers a two year study of the aquatic capabilities of members of the plant genus Polygonum (section Persicaria). Amphibious water-weeds of this group are capable of covering the entire surface of a reservoir within two years. Included in the study is discussion of the rediscovery of P. meisnerianum, a little known invader of lakes. A leaf anatomy study is discussed, but the major body of data is reserved for later publication. A series of experiments on tropisms is discussed in full. These indicate that prostrateness is partially genetically controlled and partially an inhibition o negative geotropism by light. Plagiotropy was most pronounced in amphibious plants. A series of inundation experiments was carried out in environmental chambers. After cloning the plants they were separated into two groups, one of which was submerged in an aquarium and the other grown aerially as a control. Vegetative and anatomical comparisons were made after 30 days, and 23 populations were ranked on their amphibious responses to submergence. Amphibious varieties of P. amphibium scored highest, as expected, but P. amphibium var. emersum scored below some less closely related taxa. The work strengthened suspicions that P. amphibium is of Eurasian origin with no close relatives here; however, P. densiflorum which is distantly related, appears on the verge of becoming a true aquatic.

Chemical treatments offer, at best, temporary relief from overabundance of aquatic vegetation. Even when excellent results are obtained, treatments must be repeated annually. Presently, aquatic herbicides are nonselective, usually killing all plants by contact. It would be more efficacious to use aquatic herbicides possessing selective toxicity against specific aquatic weeds, thus permitting the reestablishment of desirable plants. The cost of developing aquatic herbicides would be greater as apposed to agricultural herbicides because of the specialized testing requirements, and generally, the potential market would not be as great. Mechanical control is very promising: it involves hand-pulling or cutting and harvesting plants from restricted areas. Biological control has met with only limited success, but is an avenue of promising potential. This approach would include introducing organisms that are inimical to the target organisms and manipulating the existing aquatic environment. In a concept, this type of control uses biology against biology. Among the organisms utilized in control of aquatic plants are fish, snails, mammals, and beetles. Biological control is the only method that could provide a permanent solution to the problem of excessive aquatic vegetation. (See also W70-03975) (Jones-Wisconsin)

Identifiers: *Saguaro cactus, *Sonoran Dese *Seedlings.

During 1965-1966 the germination and establis ment of giant saguaro (Cereus giganteus Engelm were investigated in field studies at Saguaro N tional Monument, Arizona. Field germination e periments were conducted and natural seedli populations were periodically observed in fl rolling hill, and rocky terrain habitats. The reaso that such a small number of saguaro germinatio occur are bird, mammal, and insect predation the seeds and also insufficient moisture for ge mination. Germination begins in July after the st of the summer rains and continues into Septembe These rains are important because they dislod seeds from fruits, transport the seeds to protect sites and provide moisture for germination. To precipitation is greater on the flats and rolling hi than in the rocky habitat, which may partially e plain the lower germination rates in the latter are Seedling mortality, however, is lowest in rocky te rain. Seedling establishment is limited by roden insects, frost, and drought, with size and extent seedling growth appearing to depend primarily soil moisture availability immediately below t soil surface. Principal apical stem growth occu during the summer rains. New growth also tak place during the winter rains of February a March. (Carr-Arizona)

WHY CONSERVE NATURAL VEGETATION,
B. Verdcourt.
In: Conservation of Vegetation in Africa South the Sahara, p 1-9, Acta Phytogeographica Sueci 54, Uppsala, 1968. 14 refs.

Descriptors: *Forests, *Watersheds (Divide *Ecology, *Ecosystems, *Vegetation effec Evapotranspiration, Runoff, Water conservatio Social impact, Conservation, Erosion, Fertility, S conservation, Soil moisture, Soil stabilization, So water-plant relationships, Infiltration.
Identifiers: *Disturbed areas.

The author argues for widespread conservation natural vegetation from both philosophical a practical considerations. Practical values discuss include direct uses such as drug and new fo sources, scenic values, climatic effects and ener conservation, but particularly stressed are wat supply maintenance, prevention of soil erosion a conservation of soil fertility. East Afric catchment area studies have shown that natural well managed forests are unsurpassed for maximu

infiltration and natural control of stormflow or surface rungoff. This is primarily due to the combination of very porous soils, surface litter and the protective canopy which prevents erosion during intense tropical rains. When disturbances occur, such as the introduction of grazing animals during lowland dry seasons, water and nutrient retention capacity is severely damaged. A draw back with forests, however, is the tremendous water loss due to evapotranspiration, and in areas of less than 40-50 inches yearly rainfall, cultivation of arable land may actually increase ground water supplies. Similar examples may be drawn from other areas of natural vegetation. The goals of the ecologist and the agronomist are often counter to each other. (Casey-Arizona)

SODIUM-22 RETENTION AS A FUNCTION OF WATER INTAKE BY CITELLUS LATERALIS,
New Mexico Univ., Albuquerque. Dept. of Biology.
Gary L. Bintz.
In: Physiological Systems in Semiarid Environments, University of New Mexico Press, p 45-52, 1969. 2 fig, 1 tab, 6 ref. Contract AT (29-2)-1629 USAEC.

Descriptors: *Xerophilic animals, *Moisture deficit, *Water balance, *Rodents, *Radioactivity techniques, Metabolism, Physiological ecology, Moisture stress, Animal physiology, Sodium, Laboratory tests, Semiarid climates.
Identifiers: *Ground squirrels, *Hibernation, *Biological half-life, Field-adapted animals, Laboratory-acclimated animals, Water excretion.

Hibernating animals are apparently able to tolerate water stress for at least 3 weeks. Some evidence indicates the ability to carry this tolerance over into non-hibernating periods. Additionally there are indications that laboratory-acclimated animals do not retain the ability. Recently captured and laboratory-acclimated ground squirrels were subjected to differing water intakes for 1 week and then injected with Na-22. Their radioactivity retention was then measured over a period time. Lab animals excreted 22% of the isotope in the first 24 hours following injection, while field animals excreted only 7 percent. Retention in lab animals indicated approximate water requirements of 10 milliliters per 100 grams body weight per day while those of field animals were 5 milliliters per 100 grams body weight per day. Above a minimal water-intake level Na excretion appeared independent of water excretion. Either field animals posses a water stress tolerance mechanism subsequently lost by lab animals or lab animals are overhydrated and able to lose more water before water conservation becomes critical. (Casey-Arizona)

CHALLENGES AND OPPORTUNITIES FOR DESERT PLANT PHYSIOLOGISTS,
Nevada Univ., Reno. Desert Research Inst.
F. W. Went.
In: Physiological Systems in Semiarid Environments, p 219-230, University of New Mexico Press, Albuquerque, 1969.

Descriptors: *Xerophytes, *Competition, *Inhibitors, *Plant growth, *Distribution patterns, Ecology, Shrubs, Physiological ecology, Seeds, Arid lands, Osmotic pressure, Precipitation (Atmospheric), Temperature, Root systems, Tropical regions, Desert plants, Rainfall disposition, Germination, Soil-water-plant relationships.
Identifiers: *Autoinhibitors, *Climatic factors, *Annuals (Plants), Mojave Desert, Mycorrhizas, Seed production.

The problems involving water balance in desert plants are: (1) The mechanisms by which transpiration levels are reduced far below those achievable merely by stomatal closure; (2) The reasons why annuals do not extend their root systems beyond a very shallow soil layer in order to extract more water from a larger soil volume, and whether or not upper soil layer dew formation is a factor. Competition, contrary to general views, is felt to be at most a minor factor in plant distribution. Seed populations are controlled by animals and germination is selected for by precise germination control mechanisms. A number of examples are given in which the other plants in the neighborhood of a given plant do not exert limiting factors on its growth. Additionally, what were formerly considered intraspecific growth inhibitors produced by roots of desert shrubs such as Larrea are now considered autoinhibitors. All growth regulation seems to be independent of neighboring plants and it is suggested that this theory may also be extended to plant growth and distribution in non-desert areas. (Casey-Arizona)

PHYSIOLOGICAL RESPONSES OF PLANTS TO SALINITY: PLANT-WATER RELATIONS,
Arizona Univ., Tucson. Environmental Research Lab.
James J. Riley.
In: Physiological Systems in Semiarid Environments, p 249-254, University of New Mexico Press, Albuquerque, 1969. 3 tab, 2 fig, 9 ref.

Descriptors: *Osmotic pressure, *Salt tolerance, *Soil-water-plant relationships, *Transpiration, Sodium Chloride, Sulphates, Chlorides, Calcium, Stomata, Diffusion, Leaves, Physiological ecology, Plant physiology, Saline water, Root systems.
Identifiers: *Plant water potential, *Plant pressure potential, *Root water resistance, *Sap contents, Ethylene glycol, Physiological drought.

Although saline water reduces plant growth, the exact physiological systems are not understood. Red kidney bean (Phaseolus vulgaris) seedlings grown hydroponically were gradually brought to 2 and 4 atmospheres above medium level with single salt solutions of NaCl, calcium chloride, sodium sulfate or carbowax 1540 (ethylene glycol). Except with NaCl solutions, the osmotic gradient between solution and leaves decreased with increasing concentration. In all cases, water potential gradients between leaves and solution decreased with increasing concentration. Both root resistance to water movement and leaf diffusion resistance were higher in treated plants than controls. In plants treated with carbowax and sodium sulfate a water potential adjustment occurred and transpiration levels were higher. It was concluded that: (1)Sap osmotic adjustment does not indicate a water potential adjustment (2) Resistance to water movement, especially in roots may be an important consideration. (Casey-Arizona)

THE EFFECT OF SALT CONCENTRATION ON THE GROWTH AND METABOLISM OF A SUCCULENT HALOPHYTE,
Utah Univ., Salt Lake City. Dept. of Botany.
Irving McNulty.
In: Physiological Systems In Semiarid Environments, p 255-262, University of New Mexico Press, Albuquerque, 1969. 6 fig. NSF Grant GB-3485.

Descriptors: *Xerophytes, *Halophytes, *Soil-water-plant relationships, *Salt tolerance, *Chlorides, Plant physiology, Physiological ecology, Metabolism, Plant growth, Respiration, Photosynthesis, Arid lands, Osmotic pressure, Sulphates, Sodium, Potassium, Laboratory tests, Leaves, Light, Carbon dioxide, Stomata, Salts.
Identifiers: *Succulents, *Greasewood, *Physiological drouth, Environmental chambers, Succulence, Photosynthesis-respiration ratios, Water potential, Seedlings.

Seedlings of a woody, succulent-leafed halophyte, greasewood (Sarcobatus vermiculatus Hook), were grown in nutrient media and 50- or 100-millimolar increments of NaCl, KCl or sodium sulfate were added at 3- or 10-day intervals until a final concentration of 1 millimolar was achieved. Lear osmotic adjustments occurred rapidly in all treatments maintaining a favorable water gradient of 2-3 times greater osmotic pressure than the root medium. Small amounts of salt stimulated growth while larger amounts were inhibitory. Maximal growth concentrations were 2 atmospheres for chloride solutions and 5 for sulfate solutions, indicating that chloride ion rather than osmotic pressure was the inhibitory factor in the growth medium. Respiratory rates in salt-treated plants were below control levels. Inhibition of photosynthesis with NaCl increased with concentration. The photosynthesis-respiration ratio was also inversely proportional to salt concentration and indicated a greater reduction in photosynthesis than respiration. Leaf succulence as measured by length-thickness ratios increased with chloride concentration. The more succulent form may not be as efficient in carbon dioxide uptake. (Casey-Arizona)

GRADIENTS IN SPECIES COMPOSITION OF DESERT VEGETATION NEAR EL PASO, TEXAS,
Texas Univ., Arlington. Dept. of Biology.
John S. Williams.
In: Physiological Systems in Semiarid Environments, p 273-283, University of New Mexico Press, Albuquerque, 1969. 3 fig, 2 tab, 13 ref.

Descriptors: *New Mexico, *Xerophytes, *Arroyos, *Arid lands, *Soil-water-plant relationships, Ecology, Geology, Geomorphology, Alluvial channels, Soils, Vegetation establishment, Vegetation regrowth, Climates, On-site investigations, Plant populations.
Identifiers: *Rio Grande Valley, *Plant communities, *Species composition, *Importance values, Disturbing factors.

Gradients in species composition in plant communities are effected by a variety of interacting environmental factors that are often difficult to isolate and measure. In this paper vegetation, soils, climate geology and geomorphology of the Rio Grande Valley are described and historical records are reviewed. This area is an arid region with great phytographic diversity resulting mainly from various disturbing factors. It is subject to the formation of many new arroyos and deepening of older ones. Plant communities in the arroyos were surveyed; importance values of species determined; and species compositions correlated with arroyo structure. Two important plants were Fouquieria splendens, whose presence delineated arroyo importance, and Larrea divericata, which disappeared as arroyo deepening increased. Other importance species were tabulated and their significance described. In terms of plant communities, 4 overlapping zones were observed as arroyo development progressed. (Casey-Arizona)

THE ECOLOGICAL BACKGROUND TO LAND-USE STUDIES IN TROPICAL AFRICA, WITH SPECIAL REFERENCE TO THE WEST,
Birmingham Univ. (England). Dept. of Geography.
R. P. Moss.
In: Environment and Land Use in Africa, Chapter 8, p 193-238, Methuen, London, 1969. 10 fig, 6 tab, 129 ref.

Descriptors: *Soil-water-plant relationships, *Soil properties, *Ecology, *Agriculture, *Land use, Evapotranspiration, Precipitation (Atmospheric), Tropical regions, Arid lands, Semiarid climates, Animal populations, Plant populations, Planning, Rain forests, Nutrients, Fire, Grazing, Water distribution (Applied), Habitats, Biomass, Ecosystems, Grasslands.
Identifiers: *West Africa, *Ecological-agricultural interrelationships, *Nutrient cycling, *Game ranching.

Studies of land use patterns must be in terms of the ecological and agricultural factors that produced them and therefore involve insight into the strong interdependence between vegetation and soils.

Various ecosystems in West Africa--humid rain forests, savannahs, arid areas and montane regions--are therefore evaluated in this light. Tropical rain forests are characterized by high precipitation, high evapotranspiration, low percolation and low runoff. Organic and mineral nutrient recycling systems are virtually closed and constant. Savannahs are more widespread than forest areas and are characterized by: (1) much less vegetational biomass; (2) seasonal rather than continual water and nutrient cycling; (3) fire as an important ecological factor; and (4) horizontal zonation due to climatic, edaphic and anthropogenic factors. The present fauna and flora of forest and savannah are described, as well as their agricultural potentialities and limitations. Montane regions are complex and hold great agricultural potential but are also important watersheds. The implications of land use go beyond plants and soils and also include pest and disease patterns involving plants, animals and humans--all of which need to be rationally assessed. (Casey-Arizona)

THE DORMANCY AND SURVIVAL OF PLANTS IN THE HUMID TROPICS,
Ghana Univ., Legon. Dept. of Botany.
K. A. Longman.
Symposium of the Society of Experimental Biology, Vol 23, p 471-488, Cambridge University Press, 1969. 6 fig, 3 tab, 32 ref.

Descriptors: *Germination, *Photoactivation, *Temperature control, *Moisture availability, *Tropical regions, Humid climates, Humidity, Physiological ecology, Ecology, Plant physiology, Growth stages, Laboratory tests.
Identifiers: *Dormancy, *Pre-dormancy, *Budbreak, Bud dormancy, Seed dormancy.

Contrary to widespread belief, tropical climates may be highly variable. Consequently, plant growth is highly variable and dormancy is common. Two kinds of dormancy are considered: (1) bud dormancy in forest trees (2) seed dormancy in weeds colonizing open, disturbed ground. Short day-length lab experiments on several tropical tree species showed pre-dormancy mechanisms characterized by reduction or absence of both shoot growth and leaf production. After some time, with unchanged photoperiod, bud-break and renewed leaf expansion occurred. Temperature and photoperiod seem to be the initiating factors, although extrapolation of lab results to field conditions must be done cautiously. Mature plants and seedling differ distinctly in photoperiod responses and growth habits, the dormant period increasing with seedling age. In many tree species the short yearly growth period is precisely timed and occurs during the dryer season, probably because solar radiation and temperature are more crucial limiting factors than moisture. Unlike bud dormancy, tropical seed dormancy is more closely related to survival during dry periods and germination therefore occurs during rainy seasons. Since temperature, rain and photoperiod are all functionally related, different combinations of these depending on the species, may, as in the desert, trigger germination. (Casey-Arizona)
W70-10313

WATER REGULATION ON FOREST LAND.
Forest Service (USDA), Charleston. Southeastern Forest Experiment Station.
Ralph A. Klawitter.
Journal of Forestry, 68 (6):338-342, June 1970.

Descriptors: *Wetlands, *Coniferous forests, *Design criteria.
Identifiers: *Water regulation, *Timber production, *Bays, *Bottomlands, *Wet flats.

One key objective of water regulation on wet forest land is to increase timber production. Other objectives are to improve wildlife habitat, range land, and flood control. Wetland forests vary widely in site conditions and in their responses to water and soil management. Each kind--swamps, bottomlands, bays, and wet flats--must receive a prescription suited to local peculiarities, because water regulation works best when properly applied to the task for which it is designed. Measures applied, however, must be well enough understood and sufficiently controlled to enable changes in design and shifts in productivity from one resource use to another as the future demands.
W70-10408

DOES BEDDING PROMOTE PINE SURVIVAL AND GROWTH ON DITCHED WET SANDS.
Forest Service (USDA), Charleston, S. C. Southeastern Forest Experiment Station.
Ralph A. Klawitter.
Northeastern Forest Experiment Station, USDA, Forest Service Research Note NE-109, 1970. 4 p.

Descriptors: *Drainage, *Plant growth, *Pine trees, *Wetlands, *Sands, Florida.
Identifiers: *Bedding, *Survival.

Results from a study of prepared beds for planting slash pine on a wet sandy flat in Florida were inconclusive. Early growth was improved, but survival was not; and differences between a bedded site and an unbedded site were slight.

2J. Erosion and Sedimentation

PROBING THE MEDITERRANEAN'S HIDDEN GEOLOGICAL PAST.

Science News, Vol. 98, No. 1, p. 20-21, July 4, 1970. 2 fig.

Descriptors: *Sedimentology, Structural geology, *Drilling, *Geologic time.
Identifiers: *Deep Sea Drilling Project, Glomar Challenger, *Mediterranean Ridge, Tethys, Nile Cone.

The thirteenth voyage of the deep sea drilling ship Glomar Challenger will be an expedition to the Mediterranean Sea. Drillings will be made in over ten sites at a depth of approximately 1000 meters below the sea bottom. The expedition will attempt to unravel the geological history of the Mediterranean sea and its adjacent land masses as well as the chronology of faunal changes and organic deposits. Such puzzles as the formation of the Mediterranean Ridge and of the three basins in the western Mediterranean, and the disappearance of the Tethys waterway will be investigated. (Holmes-Rutgers)

FLUME WIDTH AND WATER DEPTH EFFECTS IN SEDIMENT-TRANSPORT EXPERIMENTS,
Geological Survey, Washington, D.C.
Garnett P. Williams.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC , 20402 - Price 55 cents. US Geological Survey Professional Paper 562-H, 1970. 37 p, 17 fig, 2 tab, 26 ref.

Descriptors: *Sediment transport, *Flumes, *Width, *Hydraulic similitude, *Hydraulic models, Laboratory tests, Alluvial channels, Bed load, Channel morphology, Hydraulics.
Identifiers: Sediment transport flumes, Width effects.

This paper reports 177 flume experiments made in channels of different widths and water depths, to find how the flume dimensions influence expe mental results. Sediment transport rates, grain siz water depth, and channel width were controlle the dependent variables were water dischar mean velocity, slope, and bed-form. The flu widths were 0.25, 0.5, 1.0, and 2.0 ft. In a channe ft wide flume sidewall effects very nearly completely disappeared. Narrower channels, whe wall effects were pronounced, could therefore compared to wide channels in which wall effe were absent. The slope decreased as the chan became wider, for a given unit transport rate a water depth. Multiplying the laboratory value slope, unit stream power, or shear stress by the a justment factor gives the slope power, or shear fo wide channel for the same water depth and u sediment-transport rate. Adjustment factors a are given for correcting the unit sediment-transp rate for sidewall effects, taking transport rate a dependent variable and stream power as the fl quantity which governs transport rate. Tests of t validity of the Johnson-Brooks sidewall correcti procedure showed that for the present movab bed data the degree of agreement between p dicted and measured flow depths varied with t hydraulic or transport conditions. Best agreeme usually occurred with channels 1 ft or more wi and for runs which did not have extremely rou beds. A review of the literature suggests that many rigid-boundary flows this sidewall correcti procedure is reasonably reliable. (Knapp-USGS)
W70-10244

EFFECT OF A POROUS SAND BED ON I CIPIENT SEDIMENT MOTION,
Georgia Inst. of Tech., Atlanta.
C. S. Martin.
Water Resources Research, Vol 6, No 4, p 116 1174, August 1970. 13 p, 9 fig, 25 ref. OWRR P jects B-004-GA and B-019-GA.

Descriptors: *Sediment transport, *Scour, Strea erosion, *Sands, *Permeability, Porous media, luvial channels, Seepage, Groundwater moveme Deposition (Sediments), Waves (Water), She Shear drag, Shear stress, Model studies, Hydrau models.
Identifiers: Sediment movement.

Incipient motion tests were conducted for flow in and out of a porous bed. Seepage out of a bed do not affect incipient motion measurably because t seepage force is lost once a sediment particle roc Seepage into a bed may either enhance or hind incipient motion, depending upon the relative fect of the boundary shear stress and the seepa force, both of which depend on the seepage flo For a given hydraulic gradient the size of the sa grains is critical regarding incipient motion. Fo turbid water flow over a bed, fine particles of t mixture may become deposited in the bed, resu ing in a more resistant bed. Typical values of t hydraulic gradient are given for flow out of a ca and in an ocean bed under oscillatory waves. napp-USGS)

SEDIMENT SAMPLING IN AUSTRALIA.
Australian Water Resources Council, Canberra.

Australian Water Resources Council Hydrologi Series No 3, 1969. 47 p, 2 fig, 214 ref, 6 append.

Descriptors: *Sedimentation, *Sampling, *M surement, *Sediments, Sediment transpo Foreign research, Sediment load, Sedimentati rates, Sediment yield, Bed load, Suspended lo Data collections.
Identifiers: *Australia.

Recommendations are given for methods of c lecting data on sediments in streams and reservo in Australia. There are areas where rates of erosi are serious, and sediment problems are widespre throughout the country even in areas which are garded as relatively stable. The methods of d collection and techniques of analysis now used

water resources organizations in Australia in the fields of suspended sediment transport, bed load transport, and reservoir sedimentation are reviewed. Very little data is being collected in Australia, and the amount and quality varies considerably throughout the country. Nuclear density probes have been used widely for the measurements of in-situ sediment density and there is scope for their use in Australia. Information collected from representative basins should be supplemented by sampling from a number of larger catchments. The total network of sediment measuring stations should be at least 200, and should be established by taking sediment records at approximately 1 in every 15 stream gaging stations. Systematic measurement should be made of reservoir sedimentation. There is a need for the continuous automatic measurement and recording of the sediment concentration in rivers. The data available should be published every five years on a national basis. (Knapp-USGS)
W70-10255

COASTAL EROSION IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering; and Clemson Univ., S. C. Dept. of Civil Engineering.
Leonard J. Langfelder, Donald B. Stafford, and Michael Amein.
ASCE Proceedings, Journal of the Waterways and Harbors Division, Vol 96, No WW 2, Paper 7306, p 531-545, May 1970. 15 p, 4 fig, 2 tab, 14 ref.

Descriptors: *Beach erosion, *Coasts, *North Carolina, Beaches, Erosion, Waves (Water), Ocean waves, Computer programs, Littoral drift, Mathematical models, Aerial photography, Refraction (Water waves).
Identifiers: Cape Hatteras (N C).

Aerial photography and wave refraction procedures were used to study coastal erosion along the entire 330 miles of the North Carolina coast. The aerial photography method made use of measurements made at 1,400 selected stable measuring points on photographs that were taken as early as 1938. The wave refraction method made use of a computer program to obtain the refracted directions of selected incoming waves. The longshore wave energy was then converted to littoral drift through the use of an empirical equation. The results of both methods indicate the general trend in erosion. Erosion caused by major storms is a significant portion of the total erosion. This storm-induced erosion is included in the results of the aerial photography method but has only a small influence on the results of the wave refraction method. (Knapp-USGS)

STRATIGRAPHY OF UNCONSOLIDATED SEDIMENTS IN THE SOUTHERN PART OF LAKE MICHIGAN,
Illinois State Geological Survey, Urbana.
J. A. Lineback, N. J. Ayer, and D. L. Gross.
Illinois Geological Survey Environmental Geology Notes, Note No 35, August 1970. 35 p, 6 fig, 15 ref, append.

Descriptors: *Bottom sediments, *Lake Michigan, *Illinois, Stratigraphy, Glacial drift, Lakes, Sands, Silts, Clays, Mud, Bottom sediments.
Identifiers: Lake Michigan sediments.

Unconsolidated sediments of late Pleistocene age in southern Lake Michigan can be divided into two major lithologic units. The upper unit is dominantly lacustrine clay of high water content that is soft and variably fossiliferous. The lower unit consists of compact sandy sediments of glacial origin. The upper unit was deposited after the direct influence of the last glacier was felt in southern Lake Michigan. Underlying is a series of glacial-lacustrine deposits, including sand, sandy pebbly clay, silt, and clay-pebble conglomerate. They show the direct effect of nearby glaciers. (Knapp-USGS)

SEDIMENTATION IN THE FOREDELTA OF THE VOLGA RIVER,
Astrakhan State Reservation (USSR).
Ye. F. Belevich.
Translated from Okeanologiya, Vol 9, No 6, 1969. Oceanology, Vol 9, No 6, p 808-816, 1969. 2 fig, 1 tab, 15 ref.

Descriptors: *Sedimentation, *Deltas, *Water level fluctuations, Deposition (Sediments), Sedimentary structures, Sediments, Sediment transport, Streamflow.
Identifiers: Volga River.

The foredelta of the Volga River has a smooth, but fairly complex bottom relief and represents the transition zone (35-60 km x 200 km) from the above-water delta to the deeper part of the Volga mouth area. Sedimentation in the foredelta occurs under the influence of drift and discharge currents, waves, the inflow of sediments, water level oscillations, and the development of vegetation. Three major types of deposits form: alluvial, made up of slightly modified alluvial sediments; marine, consisting of silt and shells, worked over many times by currents or swash; and residual deposits, formed as a result of the erosion of bottom deposits. Residual deposits are specific features of modern foredeltas. (Knapp-USGS)
W70-10281

QUANTITATIVE DISTRIBUTION OF SUSPENDED MATTER IN THE CENTRAL AND SOUTHEASTERN PARTS OF THE BALTIC SEA,
Akademiya Nauk SSSR. Institut Okeanologii.
O. S. Pustel'nikov.
Translated from Okeanologiya, Vol 9, No 6, 1969. Oceanology, Vol 9, No 6, p 816-827, 1969. 4 fig, 4 tab, 24 ref.

Descriptors: *Suspended load, *Oceans, *Sediments, *Sampling, Geology, Provenance, Nutrients, Silts, Particle size, Surveys, Data collections, Mapping.
Identifiers: Baltic Sea, USSR.

The distribution of suspended matter in the Baltic Sea water was examined. From a study of 317 samples (from 149 stations), collected on a filter with 0.5 micron pores, it was found that the maximum concentrations of suspended matter (1.1-12.4 mg/liter) are confined to regions near abrasion coasts and the mouths of straits. Increased concentrations of suspended matter in the open sea are produced by organisms. The minimum content of suspended matter was found in the layer from 30 to 120 m. Concentration increased markedly again at the bottom. (Knapp-USGS)
W70-10282

ORGANIC MATTER OF RECENT SEDIMENTS OF THE CASPIAN SEA,
Institute of Geology and Fuel Mineral Processing, Moscow (USSR).
O. K. Bordovskiy.
Translated from Okeanologiya, Vol 9, No 6, 1969. Oceanology, Vol 9, No 6, p 799-807, 1969. 6 fig, 3 tab, 11 ref.

Descriptors: *Bottom sediments, *Organic matter, Asphalt, Bituminous materials, Humus, Humic acids, Silts, Clays, Sampling.
Identifiers: Caspian Sea.

The distribution and composition of the organic matter of recent Caspian sediments are discussed. The carbon concentration increases with the degree of dispersion of the sediments and reaches a maximum in clayey silts of the deep water basins of the middle and southern Caspian. The degree of bituminization of organic matter is inversely proportional to the concentration of organic carbon. In the group composition of bitumens, asphaltenes (average 47.2%) and tars (37.4%) predominate. The content of oils averages 14%. Methane-naphthene hydrocarbons predominate in the composition of the oil fraction (60-70%). The amount of aromatic hydrocarbons is 3-10%. A nearly linear relationship is observed between bitumens and humic acids. (Knapp-USGS)

LAMPREY V AMERICAN HOIST AND DERRICK CO (TITLE TO ACCRETION).

266 NW 434-441 (Minn 1936).

Descriptors: *Minnesota, *Land forming, *Accretion (Legal aspects), *Land tenure, Permits, Leases, Reliction, Landfills, Shores, Boundary disputes, Mississippi River, Riparian rights, Riparian land, Public rights, Easements, Navigable rivers, Navigable waters, Judicial decisions, Legal aspects, Access routes.

Predecessors of plaintiffs owned land bounded on the north by the Mississippi River. Between the river and the lots in contest was a dedicated street. The lots, platted with the river as their northerly boundary, were conveyed by plaintiffs' predecessor to defendant. Since that time, land had been created north of the old river line by accretion. Plaintiffs contended that their predecessors retained a fee in the northern half of the dedicated street, any land then existing north of the street and any land added thereto by accretion or reliction. The court, in affirming a judgment for defendant, ruled that the lots conveyed were in fact bounded by the river. Defendant, after purchasing the lots, could well assume that there was nothing between such lots and the river to interfere with or prevent his free access from his lots to the river. Plaintiffs' predecessors conveyed all their interest in the street and the land and the riparian rights attached thereto when they sold their lots, and defendants took such rights subject only to the public easement in the street. OXYGEN-18 AND TRITIUM IN THE EVIAN BASIN (FRENCH),
Geodynamics Investigation Center, Paris (France).
J. C. Fontes, and R. Letolle, Ph. Olive, and B. Blavoux.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/28, p 401-415, 1967. 15 p, 6 fig, 4 tab, 10 ref.

Descriptors: *Stable isotopes, *Tritium, *Water chemistry, *Groundwater movements, *Groundwater basins, Tracers, Radioactive dating, Tracking techniques, Radioactivity techniques, Water analysis, Water levels, Hydrogeology.
Identifiers: France, Evian Basin.

Isotopic surveys of the Evian basin (precipitation, surface system, test wells and springs) have been going on since 1962. Measurement of oxygen-18 and tritium content have made it possible to determine the mean height of the drainage area and to consider various hypotheses in connection with the hydrodynamics of the water table. It has also been possible to determine the behavior of recent meteoric water and its possible contribution to the water-table supply. The data derived from hydrological studies are in good agreement with the set of isotopic results. The isotopic measurements have also been used to plan the catchment area equipment and to fix the test-well sites. In view of the theoretical and even economic importance of such coordinated isotopic studies, it is proposed that systematic sampling be organized on an international scale on the site on the main catchment areas presenting serious hydrogeological problems. (Knapp-USGS)

SOIL-WATER MOVEMENT AND EVAPOTRANSPIRATION: CHANGES IN THE ISOTOPIC COMPOSITION OF THE WATER,
Heidelberg Univ. (West Germany). Physikalisches Institut (II).
U. Zimmermann, D. Ehhalt, and K. O. Munnich.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/38, p 567-585, 1967. 19 p, 17 fig, 1 tab, 17 ref.

Descriptors: *Soil water movement, *Evapotranspiration, *Tracers, *Deuterium, *Tritium, Evaporation, Transpiration, Tracking techniques, Groundwater movement, Stable isotopes, Radioisotopes, Water chemistry.
Identifiers: Isotopic concentration.

An artificial rainfall spiked with tritium may be used to estimate the amount of rain fallen after the date of tracer input. Dispersion is usually combined with a scatter in the position of the tracer maximum in parallel cores. Among recent improvements in sample processing is newly developed equipment to distill six samples simultaneously. The change in stable isotope composition of the soil water during downward movement has also been studied in detail. Experiments show that plant transpiration results in practically no isotopic enrichment of soil water. The considerable average velocity with which the water moves upward from the root to the leaves makes this possible despite heavy enrichment of the water in the leaves. Under central European conditions a bare soil may, however, show a deuterium enrichment up to about 20% in the top layers. It is obvious that evaporation from the soil, and therefore enrichment, is strongly suppressed by plant cover, espically during summer. A bare soil under the same conditions as a planted one showed, in a number of measurements, deuterium enrichment of about 10% more than the average amount. With the help of information obtained by tracer experiments on the seasonal variation of groundwater recharge it is now possible to explain the absolute value found for the deuterium content of Central European groundwater. (Knapp-USGS)
W70-10104

THE RELATIONSHIP BETWEEN DISSOLVED NUTRIENT SALTS AND PROTEIN PRODUCTION IN SUBMERGED AUTUMNAL LEAVES,
Waterloo Univ. (Ontario).
H. B. N. Hynes, and N. K. Kaushik.
Verhandlungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 95-103, 1969. 3 tab, 17 ref.

Descriptors: *Proteins, *Productivity, *Submerged plants, *Autumn, *Leaves, Organic matter, Aquatic environment, Ecosystems, Nitrogen, Oak trees, Temperature, Phosphates, Decomposing organic matter, Benthic fauna, Maple trees.
Identifiers: *Dissolved nutrient salts, Ulmus americana, Alnus rugosa, Quercus alba, Speed River (Ontario), Hyalella azteca, Microbial activity, Beech, Gammarus lacustris limnaeus, Asellus aquaticus.

Autumn-shed leaves are known to constitute a substantial portion of the ecologically important allochthonous organic matter accumulating in aquatic ecosystems. A study was made to determine whether leaves kept submerged in water and provided with varying quantities of nitrogen from different sources show changes in their nitrogen and protein contents, and whether there is any increase in the absolute quantity of nitrogen. Autumn-shed leaves of elm, alder, and oak were analyzed and changes in mean pecentage weight lost and in protein and nitrogen contents of the elm leaf discs subjected to different treatments are tabulated. Both at 10C and at 20C-22C, the addition of nitrogen to the water in ammonium sulfate form or potassium nitrate enhanced percentage weight lost as compared with controls. Weight loss was generally more pronounced with the addition of phosphate or when the water was enriched with organic nitrogen (Hyalella azteca). As expected, weight loss was accelerated at higher temperatures. The greatest loss of percentage weight was consistently found in elm leaves, and the lowest in alder. Decay rates obviously must be in some way correlated with initial composition. (Jones-Wisconsin)

ANNUAL CYCLE OF PHYTOPLANKTON AND OF PRIMARY PRODUCTION IN TROPICAL SEAS (IN FRENCH),
Museum National d'Histoire Naturelle, Paris (France). Laboratoire des Peches Outre-Mer.
A. Sournia.
English abstract. Marine Biology, Vol 3, No 4, p 287-303, 1969. 5 fig, 125 ref.

Descriptors: *Phytoplankton, *Primary productivity, *Neritic, *Oceans, Sea water, Gulfs, Hydrologic aspects, Climates, Seasonal, Atlantic Ocean, Indian Ocean, Pacific Ocean, Salinity, Temperature, Tropical regions.
Identifiers: Annual cycles, Tropical seas, Brazilian coast, Caribbean Sea, Gulf of Mexico, Bahamas, Sargasso Sea, Gulf of Mannar, Madagascar coast.

Voluminous literature is reviewed describing biotic features of southern seas delineated by the minimum isotherms of 22C throughout the year. By far the larger part of information is confined to the 'neritic' or 'sea' waters, rather than waters of the oceans. In the neritic waters an annual cycle of the composition and intensity of the primary production is usually observed; the seasonal variations are related to the influence of current, upwelling, and climatic factors, especially monsoons. Information on oceanic waters is too meager to permit generalizations. (Wilde-Wisconsin)

COMPARISON OF CHEMICA HYDROGEOLOGY OF THE CARBONAT PENINSULAS OF FLORIDA AND YUCATAN,
Geological Survey, Washington, D.C.
William Back, and Bruce B. Hanshaw.
Journal of Hydrology, Vol 10, No 4, p 330-36 June 1970. 39 p, 15 fig, 5 tab, 28 ref.

Descriptors: *Geochemistry, *Hydrogeolog *Water chemistry, *Florida, Groundwat Aquifers, Leaching, Infiltration, Recharg Discharge (Water), Saline water-freshwater inte faces, Saline water intrusion, Groundwater mov ment.
Identifiers: Yucatan.

Aquifers of the peninsulas of Florida and northe Yucatan are Tertiary marine carbonate formatio showing many lithologic and faunal similarities. addition, the tropical to subtropical climates of t two areas are similar, each having annual rainfall about 1000 to 1500 mm. Despite similarities these fundamental controls, contrasts in t hydrologic and geochemical systems are numero and striking. For example, Florida has many rive Yucatan has none. In Florida, the chemic character of water changes downgradient, wi solution of minerals of the aquifer; in the Yucat no downgradient change exists, and domina processes controlling the chemical character of t water are solution of minerals and simple mixing the fresh water and an underlying body of s water. The differences are due primarily to the la in Yucatan of an upper confining bed hydrolo cally equivalent to the Hawthorn Formation Florida. The Hawthorn cover impedes rechar and confines the artesian water. In the Yucatan t permeability of the entire section is so great th rainfall immediately infiltrates to the water tab and then moves laterally to discharge areas alo the coasts. (Knapp-USGS)

FOSSIL WATER,
Geological Survey, Woods Hole, Mass.
F. T. Manheim.
Oceanus, Vol 15, No 4, p 30-32, July 1970. 3 p fig.

Descriptors: *Bottom sediments, *Salinity, Cor Chemical analysis, On-site investigations, Shi Cruises.
Identifiers: *Black Sea, *Fossil water, Press water, Sediment profile.

Chemical analyses were made from water press from sediment cores collected from the Black S during the scientific data-collecting cruise abo the R. V. Atlantis II in April and May 1969. Sali ty, alkalinity, phosphate, nitrate, ammonia, nitri and silicate determinations were made immedia ly, and other samples were fused in polyethyle pipe or in glass ampules and saved for later detail

nalysis in the laboratory. The work done on board evealed that pore fluids become less salty with epth over nearly the entire Black Sea, probably ecause of the influence of fresher waters incor-orated in the sediments during the glacial periods. he only exception to this occurs on approaching ne Bosporus, where salinities decrease less and less ith depth. A map showing the 'fossil' chlorinity of ne Black Sea sediments at a depth of two meters elow the seabottom is included. (Woodard-SGS)

SIMULATION-DECISION AID IN PLANNING DESALTING APPLICATIONS,
Office of Saline Water, Washington, D.C.
John S. Westrope.
Water Resources Bulletin, Vol 6, No 4, p 602-616, July-August 1970. 15 p, 7 fig, 1 tab.

Descriptors: *Simulation analysis, *Water resources development, *Desalination, *Systems analysis, *Optimization, Water management (Applied), Computer programs, Economics, Water costs, Conjunctive use, Mathematical models, Digital computers.
Identifiers: Office of Saline Water.

A simulation system under development is a highly flexible computerized model system for evaluating real economic/technical applicability of desalting to a selected area. The Economic Evaluation Model System (EEMS) was initially conceived during 1968 and the first version was completed in 1969. This system represents the combination of technical, environmental and economic functions into an interrelated system, which allows the user to examine a broad range of water related problems, oriented toward the applicability of desalting as an additional or alternative source of water. (Knapp-USGS)

DEVELOPMENT STUDIES ON THE FLASH DISTILLATION PROCESS,
Baldwin-Lima-Hamilton Corp., Philadelphia, Pa.
R. A. Tidball, A. N. Rogers, and R. N. Webb.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C, 20402, Price $0.75. US Office of Saline Water Research and Development Progress Report No 562, May 1970. 79 p, 24 fig, 15 tab, 10 ref, 2 append. OSW Contract No 14-01-0001-1279.

Descriptors: *Desalination processes, *Flash distillation, Thermodynamics, Scaling, Pilot plants, Desalination plants, Testing, Research and development.
Identifiers: Multistage Flash Distillation.

Two flash distillation pilot plants were operated at the OSW Test Station: (1) a 16-stage High-temperature Flash Distillation Plant; (2) a 3-stage High-flow Flash Devices Test Plant. In the 16-stage plant, scale formation is given over a range of operating conditions as well as with scale control additives. In addition, preliminary tests were made on ion exchange, fluidized bed, and slurry seeding processes. The 3-stage plant tests cover the simple open interstage orifice under a wide range of operating conditions, plus several of the more promising flash enhancers. Graphs relate non-equilibrium values to the various operating parameters. (Knapp-USGS)

VACUUM-FREEZING VAPOR-COMPRESSION PROCESS: EVALUATION ON BRACKISH WATER,
Fairbanks, Morse and Co., Beloit, Wis.
M. M. Jhawar, and J. H. Fraser.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $0.65. U S Office of Saline Water Research and Development Progress Report No 541, March 1970. 46 p, 16 fig. OSW Contract No 14-01-0001-967.

Descriptors: *Desalination processes, *Pilot plants, *Freezing, Saline water, Sea water, Potable water, Scaling, Chemical precipitation, Water chemistry, Water yield, Water costs.
Identifiers: Vacuum-freezing, Vapor-compression desalination.

The Vacuum-Freezing Vapor-Compression (VFVC) Process was evaluated on high salinity brackish water during the period from February 1968 through December 1969 at Roswell, New Mexico. A 15,000 gpd VFVC test plant is mounted on a mobile trailer. The system was checked out and the unit was operated sucessfully on sea water. In Roswell, tests were conducted to determine the effects of precipitation and scaling on the VFVC Process. A number of tests were carried out with yields of 20% to 80%, and the effluent brine concentration ranging from 2.13% to 8.0%. In the entire range, no significant evidence of precipitation or scaling was noticed. No difficulty was encountered in making 500 ppm potable water. The fresh water had a natural taste. (Knapp-USGS)

STUDY OF SEAWATER DESALTING AS EMERGENCY WATER SUPPLY FOR NEW YORK CITY.
Parsons-Jurden Corp., New York.

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $2.50. U S Office of Saline Water Research and Development Progress Report No 553, January 1970. 273 p, 57 fig, 18 tab, 73 ref, 2 append. OSW Contract No 14-01-0001-1712.

Descriptors: *Desalination plants, *Design, *New York, Cities, Water supply, Droughts, Water shortage, Water sources, Desalination, Sea water, Water utilization, Municipal water, Urbanization, Water requirements, Water resources development.
Identifiers: *New York City.

The problems involved in the application of desalting to meet the emergency and supplemental water needs of the individual boroughs of the City of New York are discussed. The criteria and controlling factors to be considered in the selection of a suita-

ble site are listed, and conceptual designs for 5-, 10- and 25 MGD module desalting plants are presented. A plant design of a size sufficient to meet the requirements of emergency and supplemental water needs was developed. An economic analysis is made of the costs of product water for 5-, 10- and 25 module plants. Although this report is oriented directly around the requirements of the individual boroughs of New York City, the developed information may be applied to evaluating the feasibility of using the distillation plant for meeting the requirements of a major subdivision of any other metropolitan area. SALINE GROUNDWATER RESOURCES OF THE RIO GRANDE DRAINAGE BASIN--A PILOT STUDY.
Geological Survey, Albuquerque, N. Mex.

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $2.00. U S Office of Saline Water Research and Development Progress Report No 560, May 1970. 71 p, 21 fig, 1 tab, 21 ref. OSW Agreement No 14-01-0001-2102.

Descriptors: *Saline water, *Water resources development, *Groundwater, *Texas, *New Mexico, Desalination, Water sources, Hydrogeology.
Identifiers: Saline groundwater.

The saline groundwater resources of the Rio Grande drainage basin of Colorado, New Mexico, and Texas were evaluated for the potential application as feed water for desalting plants. The occurrence of groundwater in the basin is controlled primarily by geologic structure, and secondarily by the stratigraphy and lithology of the aquifers. The Albuquerque, New Mexico, and Brownsville, Texas areas are underlain by aquifers that yield more than 500 gpm of saline water of about 3 g/liter salinity from individual wells. The top of this water-quality unit is approximately 3,000 feet below the land surface at Albuquerque, and 1,500 feet or less at Brownsville. The Capitan reef complex in New Mexico and Texas also would sustain large yields of water. More than 6,500 square miles of the lower Rio Grande, Estancia, Jornada del Muerto, and upper Pecos drainage basins are underlain by water of 10-35 g/liter salinity. Brine, containing more than 35 g/liter dissolved solids, is available in significant quantities in the Tularosa basin. A bibliography containing 273 entries is included. (Knapp-USGS)

RESEARCH AND DEVELOPMENT OF NEW AND IMPROVED CELLULOSE ESTER MEMBRANES,
Aerojet-General Corp., El Monte, Calif.
D. L. Hoernschemeyer, C. W. Saltonstall, O. S. Schaeffler, L. W. Schoellenbach, and A. J. Secchi.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $0.65. U S Office of Saline Water Research and Development Progress Report No 556, August 1970. 63 p, 8 fig, 15 tab, 16 ref, 3 append. OSW Contract No 14-01-0001-2205.

Descriptors: *Membranes, *Membrane processes, *Reverse osmosis, *Desalination apparatus, Desalination processes, Brackish water, Saline water, Thin films.
Identifiers: Cellulose membranes.

Improved brackish-water desalination membranes can be fabricated from cellulose acetate and cellulose acetate methacrylate in a manner very similar to that used to make high retention seawater membranes. All the acetates with a ds between 2.1 and 2.63 can be made to have equivalent osmotic properties. Vastly increased flux, along with greatly improved flux stability has been achieved by cross-linking cellulose acetate methacrylate (CAM) membranes. Salt permeability coefficient is closely related to the cohesive energy of the polymer. (Knapp-USGS)

ANNUAL REPORT (FY 1969) WEBSTER TEST FACILITY AND ELECTRODIALYSIS TEST-BED PLANT, WEBSTER, SOUTH DAKOTA.
Mason-Rust, Louisville, Ky.

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $1.50. U S Office of Saline Water Research and Development Progress Report No 568, June 1970. 159 p, 41 fig, 19 tab, 4 ref. OSW Contract No 14-01-0001-1802.

Descriptors: *Pilot plants, *Desalination plants, *Electrodialysis, *Reverse osmosis, Membrane processes, Testing, Research and development, Water costs, Desalination processes, Membranes, Cost analysis, Performance.
Identifiers: Webster (SD), Desalination test-bed facilities.

An electrodialysis Test Bed Plant has completed the seventh year of demonstration and development operation. The plant has a production capacity of 325,000 gallons per day. The electrodialysis plant feed water was pretreated for iron removal by Zeolite filtration. Lime softening plus carbon filtration was also used to pretreat the water to remove iron, manganese, bicarbonate alkalinity, some hardness, and water soluble 'organic' materials. Carbon filtration removes most of the anion permeable membrane fouling agents. Problems associated with membranes such as membrane breakage and anion membrane fouling are responsible for high product water costs. If membrane fouling and breakage were not problems, product water costs would be $0.83 per 1,000 gallons (250,000 GPD, 330 days on stream). Pilot plant development programs at Webster were in: (1) high temperature electrodialysis, (2) evaluation of membranes for electrodialysis and transport depletion, and (3) reverse osmosis. Descriptors: *Electrodialysis, *Desalination processes, Membrane processes, Flow, Boundary processes, Model studies, Mathematical models, Testing, Research and development, Dialysis, Pilot plants, Electrochemistry, Desalination, Membranes.
Identifiers: *Forced-flow electrodesalination.

Forced-flow electrodesalination (FFED) utilizes high-shear flow through thin solution compartments to reduce concentration polarization. In electrodialysis of natural brackish waters, precipitation of pH sensitive salts within the stack as a result of concentration polarization usually limits the operating current density to a value well below the economic optimum current density. With the thin solution compartments and high solution velocities of FFED, high values of limiting current density can be obtained. Cell-pair resistance also lower with the thin solution compartmen Costs of treatment of brackish waters by FFED a estimated to be about 25% less than costs of tre ment by conventional electrodialysis. A system equations was developed to describe the operati of the FFED stack. With these equations, t operating conditions, energy consumption, a production rate of a given FFED stack can be p dicted. THE POISONING OF ION EXCHANG MATERIALS BY SURFACE ACTIVE IONS,
Dow Chemical Co., Midland, Mich.
Hamish Small, and Robert C. Gardner.
For sale by the Superintendent of Documents, U Government Printing Office, Washington, D 20402 - Price $0.70. U S Office of Saline Wat Research and Development Progress Report 565, August 1970. 71 p, 22 fig, 4 ref, 2 appen OSW Contract No 14-01-0001-2158.

Descriptors: *Membrane processes, *Desalinati processes, *Ion exchange, *Surfactants, Me branes, Permeability, Resins, Semipermeable me branes, Inhibitors.
Identifiers: Membrane poisoning.

An experimental study was made of how the rate a simple ion exchange reaction is influenced by t presence of surface active ions in both resin a membrane systems. Ion exchange membra poisoning results from the formation of barri layers, which are sparsely populated by mobile ca riers, the majority of the sites being occupied sluggish, tightly bound poison ions. Exposure of i exchanging materials to even very low levels of su factants can lead to poisoning. Significant poiso ing effects were noted when the level of surfacta was about 1/1000 M. Protection for the exchang could be derived by providing for as high a degr of cross-linking as possible. This would tend prevent the accretion of large poisoning ions in t exchanger purely on a kinetic basis. Alcohols a effective, with their effectiveness increasing their nonpolar character increases. A nonionic su face active agent was effective in neutralizing t poisoning effect of surfactants. (Knapp-USGS)

VERTICAL TUBE EVAPORATION UTILIZIN VORTEX FLOW AND INTERFACE ENHANC MENT,
California Univ., Berkeley. Sea Water Conversi Lab.
Hugo H. Sephton.
For sale by the Superintendent of Documents, U. Government Printing Office, Washington, D. 20402. Price $0.75. Office of Saline Wat Research and Development Progress Report 57 May 1970. 81 p, 36 fig, 7 ref. OSW Contract 14-0 0001-1744.

Descriptors: *Research and development, *Risi film evaporation, *Falling film evaporation, *He transfer improvements, *Vortex tube process, *I terface enhancement process, *Surfactant ad tives, *Twisted tubes, Proprietary processes, Foa ing agents, OSW sponsored investigation.

The purpose of this study is to test pairs of full siz distillation tubes in vertical mode to provide co parative data from upflow and downflow modes operation. Double-fluted and spiral-corrugat distillation tubes were tested with fresh water, bri and sea water feed in both the upflow a downflow mode. Two novel, proprietary metho of brine side enhancement were applied: the Vo tex Tube process and the Interface Enhanceme method. The latter method in upflow mode w emphasized in this work. It depends upon the ad tion of selected surfactants to the feed brine in few parts per million concentrating and up establishing a foamy two-phase flow condition ov the heat transfer surface. Over-all heat transf

enhancements of about 100 percent was reproducibly demonstrated under realistic upflow VTE conditions with both double-fluted and spiral-corrugated distillation tubes using sea water feed having 6 ppm of a fully biodegradable commercial surfactant added thereto at a cost of $12 per 1.5 million gallons of sea water treated or 6 cents/1000 gallons. STREAMFLOW CHANGES AFTER FOREST CLEARING IN NEW ENGLAND,
Forest Service (USDA), Durham, N. H. Northeastern Forest Experiment Station.
J. W. Hornbeck, R. S. Pierce, and C. A. Federer.
Water Resources Research, Vol 6, No 4, p 1124-1132, August 1970. 9 p, 3 fig, 3 tab, 15 ref.

Descriptors: *Water yield improvement, *Clear-cutting, Forest management, Land clearing, Watershed management, Water yield, Rainfall-runoff relationships, Snowmelt, Hydrograph analysis, Infiltration.
Identifiers: Hubbard Brook Experimental Watershed (NH).

Clearing a hardwood forest cover and preventing regrowth with herbicides on a 39-acre watershed in central New England increased annual water yield an average 12.2 area-inches for the first two water years after treatment. Most of this increase occurred during the critical low flow months of June through September, and the amount was governed in large part by rainfall in this period. There was a small advance of snowmelt runoff and a consistent increase in growing season high flow values. Sizeable streamflow increases can result from forest clearing in the uplands of the eastern United States. (Knapp-USGS)

FACTORS AFFECTING DETERMINATION OF IRRIGATION WATER REQUIREMENTS,
California State Dept. of Water Resources, Sacramento.
John W. Shannon, and Norman MacGillivray.
7th Congr Irrig Drain, Quest 23, Rep Disc, Part 2, R24-R45, Mexico City, p 23.559-23.568, 1969. 11 p, 2 fig, 1 tab, 8 ref.

Descriptors: Irrigation, *Water requirements, Evapotranspiration, Soil moisture, Consumptive use, Crops, Root systems, Root zone, Forecasting, Plant physiology, *Irrigation efficiency, *Irrigation water, Estimating, *Irrigation operation and maintenance, *Irrigation practices, Roughness, Climates.
Identifiers: *Irrigation requirement, Ground cover, Tulare Lake Basin, Calif, Soil moisture storage, California Department of Water Res.

The California Department of Water Resources is conducting field studies to obtain data upon which reasonable estimates of irrigation water requirements may be based. Observations and data collected in the valley floor portion of the Tulare Lake Basin typify results obtained state-wide and are used to illustrate factors considered in estimating irrigation requirements. Although considerable emphasis has been placed on precise determination of evapotranspiration in research studies throughout the world in recent years, other factors of equal importance that have been neglected are: storage and use of available soil moisture accruing from rainfall and irrigation, and actual and achievable irrigation efficiencies. While these factors are interrelated, some physical factors influencing them are discussed in the light of Department of Water Resources field studies. The approach for estimating irrigation water requirements, in which all the above-listed factors are considered, is based upon a soil moisture-budgeting procedure. An example illustrates how one crop, having a deeper rooting pattern, may use excess moisture that was applied to a preceding shallow-rooted crop. (USBR)

WATER RELATIONS OF MAIZE: PART 1. - EFFECTS OF SEVERE SOIL MOISTURE STRESS IMPOSED AT DIFFERENT STAGES OF GROWTH ON GRAIN YIELDS OF MAIZE,
Rhodesia Dept. of Research and Specialist Services, Salisbury.
J. H. Wilson.
Rhodesian Journal of Agricultural Research, Vol 6, No 2, p 103-105, 1968. 2 tab, 3 ref.

Descriptors: *Corn (Field), *Growth stages, *Moisture stress, *Crop response, *Crop production, Drought, Arid lands, Semiarid climates, Soil moisture, Soil water, Irrigation, Irrigation effects, Environmental effects, Plant physiology, Plant growth, Flowering, Leaves, Grains (Crops), Soil-water-plant relationships.
Identifiers: *Rhodesia, Soil matric potential.

A study was undertaken at Salisbury, Rhodesia, in which corn was grown outdoors in soil-filled polyethylene bags. Rainfall influence on the study was prevented by clamping the bags around the base of the stalk. Irrigation held the soil matric potential above -2.0 atm except during 5 stages of growth or various combinations of these stages. At such time, irrigation was withheld and severe soil moisture stress developed until soil matric potential fell below -15.0 atm for 8 days. These drought periods occurred at the eight leaf stage, silking, and early, middle, and late grain-development stages. Drought before flowering lengthened the duration of leaves, but drought after flowering caused premature leaf aging. Number of grains per plant was reduced by up to 32 percent if drought occurred between late vegetative and early grain development stages and by up to 49 percent if drought came after flowering. Two or more consecutive

droughts during the late vegetative and early reproductive phases caused as much as 66 percent yield reduction. (See also W70-10290) (Carr-Arizona)
W70-10289

WATER RELATIONS OF MAIZE: PART 2. - THE EFFECTS OF NINE IRRIGATION REGIMES ON MAIZE,
Rhodesia Dept. of Research and Specialist Services, Salisbury.
J. H. Wilson.
Rhodesian Journal of Agricultural Research, Vol 6, No 2, p 107-108, 1968. 2 tab, 1 ref.

Descriptors: *Corn (Field), *Growth stages, *Moisture stress, *Crop response, *Crop production, Drought, Arid lands, Semiarid climates, Soil moisture, Irrigation, Irrigation effects, Environmental effects, Soil water, Plant physiology, Plant growth, Flowering, Leaves, Grains (Crops), Soil-water-plant relationships.
Identifiers: *Rhodesia, Soil matric potential.

Corn was grown in Rhodesia under wet, medium, and dry soil water regimes. Under these regimes, soil matric potential was allowed to fall to -2.0, -15.0, and less than -15.0 atm, respectively, before irrigation. Varying combinations of regimes were imposed, one before and one after silking. Drought before flowering delayed tasselling and silking and caused a decrease in number of grain. However, water regime before flowering was not nearly so important as water regime after flowering. As long as plants were well watered after flowering, heavier grain compensated for any decrease in number of grain. Leaves endured longer if watered infrequently before flowering and generously afterwards. In contrast, leaf aging was 3 to 4 weeks premature when plants were watered sparingly during the reproductive phase. (See also W70-10289) (Carr-Arizona)
W70-10290

EFFECTS OF SIMULATED GRAZING ON SOIL MOISTURE CONTENT IN MID-ELEVATION RESEEDED RANGELAND,
Utah State Univ., Logan.
John C. Buckhouse, and George B. Coltharp.
Utah Academy of Sciences, Arts, and Letters, Proceedings, Vol 45, pt 1, p 211-219, 1968. 3 fig, 4 tab, 9 ref.

Descriptors: *Grazing, *Range management, *Soil moisture, *Moisture content, *Water yield, Semiarid climates, Livestock, Ranges, Carrying capacity, Grasslands, Forages, Alfalfa, Wheatgrasses, Water conservation, Utah.
Identifiers: *Simulated grazing, *Grazing effects, *Reseeding.

In 1966 and 1967 a range plant clipping study was undertaken on an established stand of crested wheatgrass (Agropyron cristatum) and alfalfa (Medicago sativa) at Major's Flat, Utah. In 1965 27 circular plots were fenced and randomly assigned to one of 9 treatment schemes. Soil moisture on each plot was measured by a neutron meter through a soil moisture access tube. The study showed that, when compared with control conditions, significantly less soil moisture was withdrawn under extreme clipping treatments. Less intense clipping also resulted in reduced soil moisture withdrawal, although occasionally the differences were not statistically significant. On mid-elevation ranges heavy grazing apparently increases water yield, but such problems as flooding and decreased water quality may occur. This would seem to indicate that forage removal between the extremes of control conditions and complete denudation would yield the most benefits of increased livestock use and increased water yield. However, until the effects of trampling are studied, direct implications cannot be drawn between this experiment and absolute soil moisture response to livestock grazing. (Carr-Arizona)

A HYDROLOGIC BUDGET FOR A SOUTHERN ALBERTA IRRIGATION DISTRICT,
Department of Agriculture, Lethbridge (Alberta). Research Station; and Alberta Univ., Edmonton. Dept. of Agricultural Engineering.
E. Rapp, J. C. van Schaik, and N. N. Khanal.
Canadian Agricultural Engineering, Vol 11, No 2, p 54-57, November 1969. 2 fig, 3 tab, 11 ref.

Descriptors: *Hydrologic budget, *Hydrologic data, *Irrigation water, *Irrigation districts, *Water distribution (Applied), Water management (Applied), Analysis, Semiarid climates, Irrigation, Irrigation programs, Irrigation efficiency, Irrigation practices, Efficiencies, Water requirements, Diversion, Precipitation (Atmospheric), Water conveyance, Consumptive use, Diversion losses, Water loss.
Identifiers: *Alberta (Canada), *Bow River Project, Gross diversion, Farm losses, Irrigation factor, Conveyance efficiency.

The Vauxhall District of the Bow River Project in Southern Alberta, Canada, was studied from 1958 to 1968 in order to obtain data on the various components of a hydrologic budget for the area. During the 10-year study period, gross diversion was 74% and seasonal precipitation was 26% of the total items of supply. On the other side of the budget, consumptive water requirement was 54%, diversion losses 26%, and farm losses 20%. These figures yielded an average irrigation factor of 63%, water conveyance efficiency of 65%, farm irrigation efficiency of 58%, and overall efficiency of 38%. Highly significant correlations were obtained between seasonal rainfall and irrigation factor, between seasonal rainfall and gross diversion per irrigable acre, and between gross diversion and farm and diversion losses. Data analysis such as this is useful when assessing water allocation or estimating water needs on existing or proposed irrigation projects. (Carr-Arizona)

POPULATION DENSITY AND AGRICULTURAL SYSTEMS IN WEST AFRICA,
Salford Univ. (England). Dept. of Geography.
M. B. Gleave, and H. P. White.
In: Environment and Land Use in Africa, Chapter 10, p 273-299, Methuen, London, 1969. 2 tab, 70 ref.

Descriptors: *Land use, *Fallowing, *Cultivation, *Population, *Economic efficiency, Grazing, Social impact, Social values, Tropical regions, Semiarid climates, Ecology, Rain forests, Grasslands, Agriculture, Land management, Density.
Identifiers: *West Africa, *Intensive agriculture, *Extensive agriculture, *Agricultural evolution.

The effects of increasing African populations are explored in relation to their impacts on existing agricultural systems. In West Africa, 3 types of agriculture and their corresponding social effects may be distinguished: (1) shifting agriculture, occurring in relatively arid areas of low population densities and characterized by long periods of bush fallow and periodic land redistribution by the clan or family group; (2) rotational bush fallowing where land and water rights are maintained by the family or individual; (3) semi-permanent cultivation with intensive agricultural methods and the sharp diminution or disappearance of fallow periods. The land-use categories are roughly parallel with increasing population densities. However, man-land relationships do not always hold at high densities because of labor shifts into non-agricultural sectors. The agricultural categories are also roughly concurrent with the land-use stages of (1) ecological balance, (2) soil exhaustion, (3) soil and water conservation. It is suggested that in land-use studies, diagnoses of population densities are less critical than identification of the transitional periods from rotational bush fallowing to permanent cultivation. ULTRASONIC FLOWMETER,
Public Works Research Inst., Tokyo (Japan).
Takeo Kinosita.
Seventh Congress on Irrigation Drainage, Quest 24, Rep Disc, R1-R24, Mexicao City, p 24.307-24.318, 1969. 14 p, 11 fig, 2 tab.

Descriptors: *Flow measurement, *Flowmeters, *Ultrasonics, Field tests, Water management (Applied), Electronic equipment, Transducers, Velocity distribution, Laboratory tests, Foreign research, Velocity, Research and development, Measuring instruments, Instrumentation, *Discharge measurement, *Water measurement.

Identifiers: *Ultrasonic flow measurement, Test results, Japan, *Sing around system.

Flow measurement is an important procedure for water management, and is very important in irrigation and drainage. The ultrasound method of measuring flow is discussed. The 5 different kinds of ultrasonic systems available for flow measurement are: (1) beam deflection, (2) phase comparison, (3) pulse transit, (4) sing around, and (5) Doppler. Systems (1), (2), (3), and (5) need correction of the ultrasonic velocity that depends upon water temperature, density, and pressure. System (4) has no relation to the ultrasonic velocity, and is reviewed. The basic idea of the sing around system, the application to flow measurement, and use when velocity distribution is not uniform are examined. A preliminary experiment in flow measurement was performed in the laboratory prior to a field installation in a drainage channel. Results of the field installation indicated that measurement of mean velocity by ultrasound agreed well with a Price meter. (USBR)

BREAKING THE ICE BARRIER - A REPORT ON A DRAMATIC MISSION THAT LEARNED IT CAN BE DONE,
Saint Lawrence Seaway Development Corp.
George E. Wilson.
Seaway Review, Vol 1, No 1, p 19-22, 26, Spring 1970. 5 fig.

Descriptors: *Ice breakup, *Navigation, Economic feasibility, *St. Lawrence seaway.
Identifiers: Finncarrier, Michigan's Upper Peninsula, Baltic Sea.

The economic feasibility of and technological capacity for keeping the St. Lawrence Seaway navigable throughout the year are examined in this paper. At the present time the Seaway is impassable during several winter months because of ice conditions. Ice breaking operations on the Baltic Sea, which provide for year-round transportation of commerce, were observed by an investigative mission from the Seaway area. This article lists several reasons why similar ice breaking operations should be instituted for the Seaway. The costs of transportation on the Great Lakes would be reduced with year-round navigation; Michigan's iron mines are losing business to foreign competitors who have year-round access to the Eastern Seaboard; and Great Lakes ship builders are unable to bid for contracts which require delivery during winter. Identifiers: *Cambodia, *Vietnam, *Mekong River, Tonle Sap.

Control of the flood which periodically inundates 50,000 sq km in the Lower Basin of the Mekong river in Cambodia and South Vietnam is proposed by means of a barrage across the Tonle Sap. This would transform the Great Lake of Cambodia into a 72 billion cu m reservoir. A model of the system consists of a system of ordinary first order differential equations each representing water level as a function of time in one of the some 300 meshes into which the area is divided. Exchange relations between cells are based on Saint Venant's dynamic equations or on the weir type exchange laws, inertia terms being ignored in both cases due to the very small velocity of flood propagation. Boundary conditions are represented by about 50 additional imaginary cells. A flood lasting 3.5 months corresponds to about 120 computation cycles with a time increment varying between 6 hr and 48 hr. It requires about 1 hr of computer time. Printout is done by means of the IBM 1401. (Knapp-USGS)

Plaintiff brought action to recover severance damages for land taken under condemnation proceedings by the United States. The land had been condemned for the purpose of constructing a dam and reservoir in conjunction with a flood control project. Plaintiff contended that the water impounded by the dam would create a mental hazard which would decrease the value of his remaining property. Defendant contended that the danger of floods below the dam would be greatly decreased by the project. Plaintiff made no attempt to prove the dam was improperly constructed, that water would overflow barriers constructed by defendant or that the dam would add to the normal drainage problems present in the area. Furthermore, only a small amount of water was impounded behind defendant's dam. Therefore, the testimony as to the alleged mental hazard created by the dam and impounded waters was properly excluded below. The judgment for defendant was affirmed. (Price-Florida)

GROUNDWATER LEVELS IN NEBRASKA,
Geological Survey, Lincoln, Nebr.
C. F. Keech.
Nebraska Water Survey Paper 26, May 1970. 83 p, 8 fig, 1 tab.

Descriptors: *Water levels, *Groundwater, *Hydrologic data, *Nebraska, Data collection, Monitoring, Observation wells, Water wells, Water level fluctuations, Irrigation water, Water utilization, Evapotranspiration.
Identifiers: Groundwater data.

This report contains measurements made in selected wells, in Nebraska strategically located to indicate net water-level changes. All the important aquifers are represented by at least one observation well. Except for a few measurements and the 50 recording gages that continually monitor water-level fluctuations in the well, water levels are obtained in the fall, several weeks after the close of the irrigation season. Of the 33,791 registered irrigation wells, 1,361 were registered during 1969 with the Nebraska Department of Water Resources. Only 35 of the 93 counties in the State ended the 1969 year with average water levels in wells lower than the fall of 1968. Most western counties were drier than normal. (Knapp-USGS)

HOW MUCH UNDERGROUND WATER STORAGE CAPACITY DOES TEXAS HAVE,
Texas Water Development Board, Austin. Groundwater Div.
Gunnar Brune.
Water Resources Bulletin, Vol 6, No 4, p 588-601, July-August, 1970. 14 p, 7 fig, 2 tab, 20 ref.

Descriptors: *Water storage, *Aquifers, *Texas, *Inter-basin transfers, Water conveyance, Water resources development, Water transfer, Planning, Water levels, Drawdown, Evapotranspiration, Artificial recharge, Injection wells, Conjunctive use.
Identifiers: Texas Water Plan.

Water imported into Texas under the Texas Water Plan must be stored in surface or underground reservoirs. Groundwater levels are being drawn down heavily in many parts of Texas. This is causing a shift of much water from a surface water to a groundwater environment. The lowering water tables have resulted in a great reduction in wastage of water through evapotranspiration and spring and well flow. The methods used in estimating the quantities of underground storage capacity available in Texas are discussed. Some problems will be encountered in the use of dewatered underground storage capacity by artificial recharge. In spite of these problems, probably 60 to 70% of the dewatered storage capacity of Texas aquifers can be reused for groundwater storage. Most of this capacity is located where it can be used in conjunction with the Texas Water Plan. (Knapp-USGS)

SOUTHERN MARYLAND RECORDS OF SELECTED WELLS, WATER LEVELS, AND CHEMICAL ANALYSES OF WATER,
Geological Survey, Towson, Md.
James M. Weigle, and Wayne E. Webb.
Maryland Geological Survey Basic Data Report No 4, 1970. 48 p, 1 fig, 4 plate, 5 tab, 5 ref.

Descriptors: *Water wells, *Data collections, *Water levels, *Groundwater, *Maryland, Surveys, Investigations, Hydrologic data, Geology, Hydrogeology, Water quality, Water supply, Aquifers, Observation wells.
Identifiers: Calvert County (Md), Charles County (Md), St. Marys County (Md).

This report presents basic data collected as part of a study of water resources in southern Maryland by the U. S. Geological Survey in cooperation with the Maryland Geological Survey. Included in the area investigated are Calvert, Charles, and St. Marys Counties--1044 square miles of land area limited on the east by Chesapeake Bay and on the southwest by the Potomac River. The data in this report include records of about 424 wells and test holes, chemical analyses of water from 150 wells and 13 stream sites, and hydrographs based on periodic measurements of water levels in 17 wells. Drillers' logs are available for many wells. Geophysical logs (gamma and/or electric) are available for some wells. Hydrographs show water-level changes in observation wells in Calvert, Charles, and St. Marys Counties and southernmost Prince Georges County for their periods of record. The corresponding water-level measurements for those periods are available, and the wells at which the measurements were made are described. (Knapp-USGS)
W70-10231

HYDROGEOLOGIC DATA FOR THE LOWER HOUSATONIC RIVER BASIN, CONNECTICUT,
Geological Survey, Hartford, Conn.
I. G. Grossman, and William E. Wilson.
Connecticut Water Resources Bulletin No 20, 1970. 50 p, 2 fig, 1 plate, 5 tab, 14 ref.

Descriptors: *Hydrologic data, *Water wells, *Streamflow, *Connecticut, *Data collections, Hydrogeology, Water levels, Aquifers, Water quality, Geology, Publications.
Identifiers: Housatonic River basin (Conn).

Hydrologic and geologic data collected for an investigation of the lower Housatonic River basin by the U. S. Geological Survey are presented. The basic-data report can be used for detailed information needed in planning water resources development at specific sites. The locations of sites at which data were collected are shown on plate A. Tables include records of 261 wells and logs of 8 wells and 456 test holes. Partial records of streamflow discharge measurements collected at gaging stations within the report area in the period 1965 to 1967 were augmented by stage measurements. (Knapp-USGS)
W70-10233

HYDROLOGIC CONDITIONS AND ARTIFICIAL RECHARGE THROUGH A WELL IN THE SALEM HEIGHTS AREA OF SALEM OREGON,
Geological Survey, Tacoma, Wash.
Bruce L. Foxworthy.
For sale by the Superintendent of Documents, U. Government Printing Office, Washington, D 20402. US Geological Survey Water-Supply Paper 1594-F, 1970. 56 p, 6 fig, 2 plate, 5 tab, 27 ref.

Descriptors: *Artificial recharge, *Injection wells, *Oregon, Water levels, Basalts, Aquifers, Water yield, Water quality, Permeability, Transmissivity, Suspended load.
Identifiers: Salem (Oregon).

In the Salem Heights area of Salem, Oreg., pumping from wells that tap a permeable zone of limited extent in basalt of the Columbia River Group caused serious year-to-year declines of groundwater levels. To determine the feasibility of reducing these declines by artificially augmenting the natural recharge and to develop techniques applicable to a municipal program of artificial recharge, 24.5 million gallons of surplus water was injected under pressure into one of the municipal wells during three periods, ranging in duration from 1 to 15 days, at an average injection rate of about 330 gallons per minute. The recharge water contained abundant dissolved air and, at times, excessive sediment; in other respects it was of excellent quality and was compatible with the native groundwater. The artificial recharge had no apparent deleterious effects on the quality of the groundwater. Pressure rise from the injected water spread rapidly through the permeable aquifer, but the residual buildup of groundwater levels was soon masked by a seasonal rising trend of levels. The geologic and hydrologic conditions, however, preclude the escape of substantial volumes of the recharge water. The conditions appear to be favorable for further artificial recharge. Changes in the specific capacity of the recharge well provide valuable guidance for subsurface injection operations. (Knapp-USGS)
W70-10236

WATER RESOURCES AT MARINE CORPS SUPPLY CENTER, BARSTOW, CALIFORNIA FOR THE 1969 FISCAL YEAR,
Geological Survey, Menlo Park, Calif.
J. H. Koehler.
US Geological Survey Open-file report, May 18, 1970. 22 p, 5 fig, 4 tab, 4 ref.

Descriptors: *Water supply, *Water resources development, *California, Aquifers, Water wells, Groundwater, Hydrogeology, Sampling, Data collections, Hydrologic data.
Identifiers: Barstow (Calif), Aquifer testing, Pumping tests.

The water supply for the Marine Corps Supply Center, Barstow, California is obtained from wells in the Barstow and Yermo groundwater subunits of the Mojave River basin. Recharge to the groundwater subunits depends almost entirely on seepage from floodflow in the Mojave River. In the 1969 water year the total flow at the gage at Barstow was 146,000 acre-feet which resulted in about 60,000 acre-feet of recharge to the groundwater subunits. Between March 1968 and April 1969 the water levels rose an average of 1.2 feet in the Yermo supply wells and 10.1 feet in the Nebo supply wells. The chemical quality of water from the Yermo supply wells is within the U.S. Public Health Service recommended limits for dissolved chemical constituents. Pumping tests were made of nine supply wells in the summer of 1969. The pumping test of well 9N/1E-3P2 (Yermo 5), drilled in July 1969, indicates that this well could be pumped at a sustained yield of at least 2,500 gpm. (Knapp-USGS)

WATER IN URBAN PLANNING, SALT CREEK BASIN, ILLINOIS--WATER MANAGEMENT AS RELATED TO ALTERNATIVE LAND-USE PRACTICES,
Geological Survey, Washington, D.C.
Andrew M. Spieker.

For sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price $1.00. U S Geological Survey Water-Supply Paper 2002, 1970. 147 p, 52 fig, 5 tab, 33 ref.

Descriptors: *Water pollution, *Urbanization, *Illinois, Surface waters, Groundwater, Aquifers, Groundwater recharge, Streamflow, Drainage, Topography, Soils, Floods, Water quality, Water management (Applied), Water pollution control.
Identifiers: *Changing land use, Flood control measures.

This report concentrates on related urbanization problems of groundwater recharge, water quality, management of flood plains, and flood-control measures in the Salt Creek basin in Cook and Du Page Counties of the rapidly developing Chicago metropolitan area. Salt Creek basin has a drainage area of 150 square miles. It is in flat to gently rolling terrain, underlain by glacial drift as much as 200 feet thick which covers a dolomite aquifer. In 1964, the population of the basin was about 400,000, and 40% of the land was in urban development. The population is expected to number 550,000 to 650,000 by 1990, and most of the land will be taken by urban development. (Woodard-USGS)

EFFECTS OF CLEAR-CUTTING ON STREAM TEMPERATURE,
Oregon State Univ., Corvallis.
George W. Brown, and James T. Krygier.
Water Resources Research, Vol 6, No 4, p 1133-1139, August 1970. 7 p, 4 fig, 1 tab, 13 ref. FWPCA Grant WP-423.

Descriptors: *Water temperature, *Clear-cutting, *Thermal pollution, *Water pollution sources, *Lumbering, Forest management, Forestry, Solar radiation, Oregon, Vegetation effects.
Identifiers: Clear-cutting effects (Water temperature).

The amount of sunlight effective in warming streams may be increased after clear-cut logging. Average monthly maximum temperatures increased by 14 deg F and annual maximum temperatures increased from 57 deg to 85 deg F one year after clear-cut logging on a small watershed in Oregon's coast range. In a nearby watershed where strips of brush and trees separated logging units from the stream, no changes in temperature were observed that could be attributed to clearcutting. (Knapp-USGS)

SOME PRINCIPLES OF FOREST HYDROLOGY PERTINENT TO EVEN-AGED MANAGEMENT OF EASTERN HARDWOODS,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
J. H. Patric.
Northern Logger and Timber Processer, July 1970, p 14-15, 26-27.

Descriptors: *Mountain forests, *Rainfall-runoff relationships, *Small watersheds, Accelerated erosion, Demonstration watersheds, Overland flow, Soil erosion, Soil stability, West Virginia.
Identifiers: *Clearcutting, *Logging roads, Forest watersheds, Logging, Turbidity, Experimental watersheds.

There is an historical basis for public and professional concern that the present swing to even-aged management of eastern hardwoods will have unwanted effects on forest water resources. Nevertheless, a review of the relevant literature shows that (1) clearcutting per se has negligible effect on hydrologic properties of forest soils, (2) clearcutting increases streamflow, and (3) logging roads cause most of the damage to streams draining clearcut forest land. (Patric-Forest Service)

4D. Watershed Protection

EROSION, RUNOFF, AND REVEGETATION OF DENUDED CONSTRUCTION SITES,
Agricultural Research Service, Lafayette, Ind. Soil and Water Conservation Research Div.; and Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
L. D. Meyer, W. H. Wischmeier, and W. H. Daniel.
Paper No 69-704, presented at American Society of Agricultural Engineers 1969 Winter Meeting, Chicago, Illinois, Dec 9-12, 1969. 8 p, 4 fig, 2 tab, 24 ref.

Descriptors: *Erosion, *Land forming, *Urbanization, *Sediment yield, *Sediment control, Road construction, Sedimentation rates, Slope stability, Soil conservation, Revegetation, Simulated rainfall, Erosion control, Land development.
Identifiers: Construction site erosion.

Erosion and runoff rates were measured for six treatments representing typical construction site conditions that result from major land reshaping. Subsequently, reestablishment of vegetation on these conditions was studied in relation to various methods of reshaping, mulching, fertilizing, and seeding. A series of simulated rainstorms totaling 5 inches was applied at an intensity of 2.5 in/hr on 35-foot subsoil plots with 12 percent slopes. The resulting erosion and runoff were very great. The only treatment that effectively controlled erosion was straw mulch, which reduced soil loss to less than 10 tons per acre. Of of the five original treatments on which revegetation was studied, applied topsoil was by far the most successful treatment. Mulched subplots were greatly superior to unmulched. A layer of good soil over a denuded area plus surface mulch is the best combination of those treatments tested for minimizing soil erosion and enhancing rapid revegetation on reshaped land. Additional benefits may be expected from minimized compaction of such areas, shallow surface tillage before seeding, use of a seed mixture containing fast-growing grasses, and application of supplemental irrigation as needed. (Knapp-USGS)

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

IDENTIFICATION OF OIL SPILLS: COMPARISON OF SEVERAL METHODS,
Melpar, Inc., Falls Church, Va.
J. Horowitz, G. D. Gumtz, R. G. Nemchin, and T. P. Meloy.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 283-296, 1970. 14 p, 88 ref.

Descriptors: *Tagging, *Tracking techniques, *Oily water, *Water pollution control, *Tracers, Analytical techniques, Water chemistry, Pollutant identification, Marking techniques, Legal aspects.
Identifiers: Oil spill treatment.

Several methods of identifying the source of oil pollution are critically examined. These methods are grouped into passive tagging and active tagging. Passive tagging assumes that oils are so chemically diverse that their contents constitute a stable chemical fingerprint that can be unequivocally disclosed in the laboratory. Active tagging requires that an inexpensive, coded material be added to oil; this material must be chemically and plysically stable in both oil and oil slicks; it must also be readily identifiable by available analytical techniques. Trace metals, sulfur-isotope ratios, paper chromatography, halogenated polycyclic aromatics, organometallics, and coded microspheroids were studied. Passive tags are not recommended because the passive tags are quite likely to mingle, to evaporate, to be dissolved, or to be oxidized. Even if these processes do not occur, they can create formidable forensic problems. Active tags are stable and identifiable. (See also W70-10035). (Knapp-USGS)

PESTICIDES IN SURFACE WATERS OF THI UNITED STATES--A 5-YEAR SUMMARY, 1964 68,
Federal Water Pollution Control Administration Cincinnati, Ohio. Analytical Quality Contro Branch.
James J. Lichtenberg, James W. Eichelberger, Ronald C. Dressman, and James E. Longbottom.
Pesticides Monitoring Journal, Vol 4, No 2, p 71 86, September 1970. 16 p, 2 fig, 8 tab, 9 ref.

Descriptors: *Pesticides, *Water quality, *Wate pollution sources, *Chlorinated hydrocarbon pesti cides, Surveys, Reviews, Data collections, Analyti cal techniques, Persistence.
Identifiers: Pesticides in water.

This report summarizes the results of five annua synoptic surveys (1964-68) for chlorinate hydrocarbon pesticides in surface waters of th United States. The results showed widespread oc currence of these compounds. The number of oc currences reached a peak in 1966 and the declined sharply in 1967 and 1968. Dieldrin an DDT and its congeners DDE and DDD were th compounds most frequently detected throughou the 5-year period. The maximum concentration found have not exceeded permissible limits as the relate to human intake directly from a domesti water supply. However, they have often exceede the environmental limit of 0.050 micrograms/lite recommended by the Federal Committee on Wate Quality Criteria. (Knapp-USGS)

ACTIVABLE RARE EARTH ELEMENTS ESTUARINE WATER TRACERS,
Stanford Univ., Calif. Dept. of Civil Engineering; and Public Health Service San Francisco, Calif.
J. K. Channell, and P. Kruger.
Fifth International Water Pollution Research Conference, San Francisco, July 26-Aug 1, 1970. Preprint, 20 p, 5 fig, 4 tab.

Descriptors: *Tracers, Estuary, Bottom sediments, Solubility, Chelation, Absorption, Sewage, Turbidity, Costs, Hydrogen ion concentration, Estuaries, Analytical techniques.
Identifiers: Nuclear Activation Analysis, San Francisco Bay, *Rare earth elements, *Europium, *Lanthanum.

A reliable analytical method has been developed for separating the rare-earth elements (REE) as a group from estuarine water and detecting europium and lanthanum in quantities as low as 1 ng and 20 ng per sample. Although REE may adsorp to suspended solids at normal pH, the analytical method measures these together with those in solution. Losses to bottom sediments can be estimated and are not serious for estuaries with average depths greater than 10 ft. These characteristics enable REE to be used in tracing the dissolved, suspended solids, and settleable solids phases of sewage effluent. Estuarine water can also be traced if REE are injected at a low pH in areas of low suspended solids concentration. The activable REE can also be used as multiple tracers or to extend the range of fluorescent dye or radionuclide tracers. The minimum detectable amount of added tracer is 110 ng/l for lanthanum and 15 ng/l for europium. Lanthanum tracer is less expensive than Rhodamine WT dye in large studies. Estimated lanthanum costs are slightly greater than tritium of La140 for large studies but may be preferable because of radiological health considerations. Europium is not economically competitive. (Upadhyaya-Vanderbilt)

RAPID MEASUREMENT OF ORGANIC POLLUTION BY TOTAL ORGANIC CARBON AND COMPARISONS WITH OTHER TECHNIQUES,
Geological Survey, Menlo Park, Calif.
J. W. Helms.
U S Geological Survey Open-file report, May 21, 1970. 9 p, 3 fig, 33 ref.

Descriptors: *Water analysis, *Organic matter, Biochemical oxygen demand, Oxygen demand, Organic wastes, Pollutant identification, Organic loading, Analytical techniques, Chemical analysis.
Identifiers: Total organic carbon analysis.

Among the techniques for measuring carbonaceous material in water, the TOC (total organic carbon) determination is probably one of the best in terms of speed and accuracy. As a means of monitoring waste discharge, the TOC method is the most applicable. Results can be obtained promptly to allow corrective measures to be made before significant impairment occurs in the receiving water. Waste discharging facilities can utilize on-site TOC monitors to shorten the time interval when improper treatment processes allow objectionable waste to be discharged. TOC monitors may also prove useful in the monitoring of various stages of waste treatment. Modifications of treatments could be initiated almost immediately to cope with changes in waste composition. Plant wastes for a particular process or product are generally uniform in content. If a correlation is established between methods, that correlation should hold until the process is changed. Where wastes contain a myriad of organic compounds, if one or a few should change in concentration, good correlation should still be possible since the total composition remains fairly uniform. Municipal or sanitary wastes fall into this category. (Knapp-USGS)
W70-10261

AN AUTOMATED METHOD FOR DETERMINING MERCURY IN WATER,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
P. D. Goulden, and B. K. Afghan.
Canada Department Energy, Mines and Resources, Inland Waters Branch Technical Bulletin No 27, 1970. 21 p, 13 fig, 3 tab, 5 ref.

Descriptors: *Pollutant identification, *Water analysis, *Heavy metals, *Spectrophotometry, *Flame photometry, Trace elements, Laboratory tests, Analytical techniques, Poisons, Sampling, Automation, Instrumentation, Measurement.
Identifiers: Mercury, Mercury analysis, Atomic absorption spectrophotometry.

A method is given for determining the mercury content in water with mercury concentrations as low as 0.05 micrograms/liter. The method was applied to water samples containing both inorganic- and organo-mercury compounds. It involves the oxidation of organo-mercury compounds by ultraviolet irradiation followed by the reduction of the mercury to the elemental state. The mercury is swept out of the solution by a stream of air and its concentration measured in an absorption cell in an atomic absorption spectrophotometer. For levels of mercury in the range 1.0 to 32 micrograms/liter the method is automated to measure 20 samples per hour. For levels of mercury in the range 0.05 to 1.0 micrograms/liter only 10 samples per hour can be processed because a longer sampling time is required. (Knapp-USGS)

BIOLOGICAL SYSTEMS AS POLLUTION MONITORS,
Virginia Polytechnic Inst., Blacksburg. Dept. of Biology.
John Cairns, Jr., Richard E. Sparks, and William T. Waller.
Research/Development, Vol 21, No 9, p 22-24, Sept 1970. 3 p, 6 fig.

Descriptors: *Monitoring, *Water pollution control, *Water pollution effects, *Bioindicators, Fish, Water chemistry, Toxicity, Trace elements, Poisons, Waste disposal.
Identifiers: Water pollution monitoring.

The use of continuous monitoring of the activity of aquatic life in a stream to detect an increase in the level of pollutants before the increase reaches the danger levels was studied using fish in tanks. Three biological parameters of fish--movement, breathing and electrocardial activity--are monitored with two types of apparatus. Basically, each apparatus consists of test chambers in which fish are maintained, sensing devices, amplifiers and records. The swimming movement monitor uses photoresistors as sensors. One fish is maintained in each of six, 5-gallon aquaria. Each aquarium is traversed by light beams at the top, middle and bottom levels. When a fish moves through a light beam at a particular level, a photoresistor acts through an amplifier to make a blip on an event recorder and to advance a digital counter. The breathing and electrocardial monitor uses a needle electrode inserted in the breast of the fish as a sensor. By using biological monitoring systems, it is possible to obtain quick information as to when a waste toxicant level changes. The type of information generated is of such a nature that it can be fed directly into a computer, and the time lag in determining changes can be significantly reduced. (Knapp-USGS)

SPECTRAL ANALYSIS--APPLICATIONS IN WATER POLLUTION CONTROL,
Federal Water Pollution Control Administration, Washington, D.C. Estuarine and Oceanographic Programs Branch.
T. A. Wastler.
Federal Water Pollution Control Administration Report CWT, December 1969. 99 p, 34 fig, 13 tab, 17 ref.

Descriptors: *Statistical methods, *Frequency analysis, *Fourier analysis, *Time series analysis, *Water quality, Estuaries, Digital computers, Water pollution control, Analytical techniques, Data processing, Path of pollutants.
Identifiers: Spectral analysis.

The application of spectral analysis is explained for the interpretation of time series water quality data, both in estuaries and in free-flowing streams. The statistical manipulation of time-series data by spectral analysis results in the computation of those parts of the variance of a record that recur at constant time intervals as well as the part that is random (non-recurring) in character. The power spectrum computation is the fundamental operation of data reduction and interpretation by means of spectral analysis; the many other computations that can be made in spectral analysis are all based firmly upon the concept and calculation of individual power spectra. Like any other method of data analysis, this method has its limitations and disadvantages. Three major requirements for the record may be regarded as limiting. First, the record must be fairly long--generally having over 100 sequential measurements. Second, there must be no missing data--if measurements are missing, suitable values must be interpolated before spectral analysis is attempted. Third, the mathematical procedures require so much computation that the use of a high-speed digital computer is essential for most analyses. (Knapp-USGS)

FISH BIOASSAYS - REPRODUCIBILITY AND RATING,
Virginia Polytechnic Inst., Blacksburg. Dept. of Biology.

John Cairns, Jr.
Separata de Rivista de Biologia, Vol 7, Nos 1-2, p 7-12, 1969. 8 ref, 2 tab, 9 fig.

Descriptors: *Bioassay, *Methodology, *Test procedures, Laboratory tests, Testing, Variability, Laboratory animals, Acclimatization, Fish behavior.
Identifiers: *Reproducibility, *Rating system, Synthetic water, Test organisms, Fish bioassays.

This paper proposed that research bioassay investigations be carried out with methods and procedures that can be duplicated in other laboratories. Also suggested was a rating system to indicate how closely an author has adhered to generally accepted bioassay methodology. The two major obstacles to obtaining data that may be readily reproduced are lack of certainty regarding (1) the quality of the dilution water and (2) the uniformity of the response of the test organism. The use of synthetic dilution waters will overcome the first problem and using an accepted test species (list given) will overcome the second problem. (Sjolseth-Washington)

ASSAYING ALGAL GROWTH WITH RESPECT TO NITRATE CONCENTRATION BY A CONTINUOUS FLOW TURBIDOSTAT,
California Univ., Berkeley; and Ministry of Health, Jerusalem (Israel).
G. Shelef, W. J. Oswald, and C. C. Golueke.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint. 9 p.

Descriptors: *Analytical techniques, *Algae, *Assay, Chlorella, Nitrates, Chemical analysis, Chlorophyta, Diatoms, Temperature, Optical properties, Growth rates.
Identifiers: *San Joaquin Delta (Calif), *Continuous flow turbidostat, *Growth kinetics, Chemostats, Flagellate algae, Optical density sensor.

This study employed a continuous flow turbidostat and a chemostat to appraise the effect of nitrate-nitrogen concentration on the growth of two strains of Chlorella pyrenoidosa (TX 71105 and Emerson). In one trial a mixture of algae indigenous to San Joaquin Delta (California)--green, green flagellates and diatoms--was used as test organisms. The specific growth rate increased with temperature and concentration of nitrogen. The concentration of nitrate-nitrogen decreased with temperature above 35C. The growth optimum was not necessarily optimum for nitrate utilization. The mixed culture of algae showed substantial specific growth rate at much lower nitrogen concentration than C pyrenoidosa. Results of the study emphasize the wide difference in nitrogen requirements of various algal species. The turbidostatic method proved more expensive, but more advantageous than the chemostatic method. (Wilde-Wisconsin)

MICROBIAL MODIFICATION OF CRUDE OIL IN THE SEA,
Scripps Institution of Oceanography, La Jolla, Calif.
C. E. ZoBell.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 317-326, 1970. 10 p, 84 ref.

Descriptors: *Oily water, *Biodegradation, *Oil, Nutrients, Bacteria, Oxidation, Path of pollutants, Aquatic microbiology.
Identifiers: Oil spills, Oil decomposition.

Hydrocarbons and crude oils are susceptible to microbial oxidation. More than a hundred species of bacteria, yeasts, and fungi are able to oxidize hydrocarbons. Each species is limited in the kinds of hydrocarbons it can attack and also by the temperature, salinity, surface tension, pH, oxygen tension, and other environmental conditions. Oil-oxidizing bacteria are most abundant in coastal waters and mud where oil pollution is chronic. Such bacteria are extremely scarce in the open sea. Bacteria in well-oxygenated waters might oxidize oil at rates ranging from 0.02 to 2 grams per square meter per day at 20 deg to 30 deg C. (See also W70-10035). (Knapp-USGS)
W70-10046

MICROBIAL DEGRADATION OF NORMAL PARAFFIN HYDROCARBONS IN CRUDE OIL,
Florida State Univ., Tallahassee. Dept. of Oceanography.
R. J. Miget, C. H. Oppenheimer, H. I. Kator, and P. A. LaRock.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 327-331, 1970. 5 p, 9 fig, 2 tab, 7 ref.

Descriptors: *Biodegradation, *Oil, *Oily water, Oxidation, Nutrients, Surfactants, Bacteria, Microorganisms, Path of pollutants, Aquatic microbiology.
Identifiers: Oil spills, Oil decomposition.

Experiments were designed to measure the oxidation and degradation of crude oils by naturally occurring marine microorganisms. Fifty active oil degrading cultures were isolated in enriched seawater containing crude oil. Oil degradation was determined with gas chromatography, wet combustion, and by measurement of surface tension. Normal paraffin hydrocarbons through C-26 are degraded by two different groups of microorganisms--those growing in the oil phase only and those growing in the aqueous phase. Emulsification of the crude oil through production of surfactants was observed in many of the enriched cultures. Microbial degradation of 35 to 55% of oxidizable crude oil occurred within 60 hours. DISPERSAL OF EFFLUENTS IN THE GREA LAKES,
Waterloo Univ. (Ontario).
G. T. Csanady.
Water Research, Vol 4, No 1, p 79-114, Januar 1970. 36 p, 34 fig, 32 ref. FWQA Grant No WP 01139-01.

Descriptors: *Dispersion, *Path of pollutants *Great Lakes, *Currents (Water), Outlets, Waste disposal, Water pollution sources, Water pollutio control, Mixing, Jets, Turbulence, Water circula tion, Thermal stratification, Lakes, Limnology Tracers, Tracking techniques, Diffusion, Mode studies, Hydraulic models, Mathematical models.
Identifiers: Conservative pollutants.

A comprehensive description is given of the physi cal factors involved in the dispersal of conservativ pollutants in the Great Lakes, based mainly on ex perimental data obtained in Lakes Huron and Eri over 7 years. Parameters important in small-scal diffusion problems are current speed and effectiv (eddy) diffusivity. Constant values of thes parameters adequately describe the diffusion of in dividual parcels or plumes of marked fluid, but th appropriate values depend on turbulence intensity which is in turn dependent on thermal stratifica tion. On a larger scale, the meandering of effluen plumes becomes an important dispersa mechanism. With some meandering, however, ef fluents discharged near shore almost alway generally follow the shorelines, apparently i response to the lake-wide flow pattern which is be lieved to be characterized by coastal jets nea

shores and (at least during the summer periods) oscillating currents in the central portions. The resulting phenomenon of coastal entrapment of pollutants leads, for a near-shore source, to the formation of a relatively heavily polluted influence region of typically perhaps 25 km extent either side of the source. (Knapp-USGS)

FLOW FROM A SPHERICAL SOURCE WITH WATER CONTENT DEPENDENT DIFFUSIVITY,
San Jose State Coll., Calif.
Rameshwar Singh.
Water Resources Research, Vol 6, No 4, p 1140-1147, August 1970. 8 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Water pollution sources, *Path of pollutants, *Diffusion, *Soil water movement, *Radioactive wastes, Equations, Groundwater movement, Leaching, Mathematical models, Mixing, Radioactive waste disposal, Unsaturated flow, Saturated flow, Adsorption, Adsorption, Ion transport.
Identifiers: Spherical diffusivity.

Leakage of moisture from underground buried sources can occur because of cracking or deterioration of containers. Leaking moisture can be radioactive or contaminated and may endanger public health. In disposal of such substances underground, consideration must be given to the extent of dispersal of moisture from wet containers in case of accidents. The movement of moisture from a spherical buried source into partially saturated surroundings is described by a nonlinear partial differential equation. Complexity of the equation prevents obtaining an explicit solution of the problem; however, an approximate solution may be extracted by the method of weighted residuals. The technique calls for representing the solution with a polynomial in space variable that has its coefficients as unknown functions of time, to be determined from the conditions and by satisfying the equation by averaging over the range of space-variable. This procedure accepts any kind of diffusivity function including numerical values obtained from experiments. The method is simple in its application and produces results that compare well with the known solution. (Knapp-USGS)

AGRICULTURE CHEMICALS AND OUR WATER RESOURCES,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
Edwin J. Monke, and Philip R. Goodrich.
Agricultural Engineering, Volume 51, No. 6, p. 358, June 1970.

Descriptors: *Agricultural chemicals, *Nitrates, *Pesticide residues, Activated carbon, Storm runoff.
Identifiers: *Bio-environmental control, Methemoglobinemia, Cynanosis.

Although bio-environmental control has been suggested as an alternative to pesticide usage, agrochemical usage can be made safe to the environment by good management. Pesticides are being blamed for contamination of water on a large scale, but pesticide pollution occurs mainly from land runoff or from polluting manufacturing processes. Agricultural engineers are also faced with the problem of developing methods to alleviate pollution caused by nitrate fertilizers. The long held idea that deep wells could satisfactorily counter the ill effects from nitrate leaching has proven to be unacceptable. (Holmes-Rutgers)

OXYGEN DYNAMICS IN THE THERMAL MIXING ZONE,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Chemical Engineering.
R. C. Ahlert, and D. Nochumson.
Fifth International Water Pollution Research Conference, San Francisco, July 26-Aug 1, 1970. Preprint, 14 p, 10 fig, 1 tab, 25 ref.

Descriptors: *Thermal pollution, *Mixing, Dispersion, Reaeration, Mathematical models, Diffusion, Velocity.
Identifiers: Equilibrium index, Oxygen dynamics, Reaction rate constant.

A conventional, one-dimensional model of oxygen dynamics is not satisfactory for that stretch of a river downstream of a thermal outfall, which can be characterized as the mixing zone. The oxygen dynamics of the mixing zone have been analyzed on the basis of interfacial reaeration and carbonaceous biological oxygen demand. Great care must be taken in sampling thermal and material quality of stream in regions that involve interaction between thermal and material outfalls. Regions of stratification and channeling can be expected downstream of some outfalls. The combination of thermal dispersion processes, both chemical and biological reactions and transport processes at the interface can yield results totally unpredicted by one dimensional modelling. Of particular importance is the capacity of this technique to predict the point at which limited sampling downstream of one or more outfalls becomes a possible basis for stream quality management involving both physical and/or legal control. PLUME LENGTHS PREDICTED MATHEMATICALLY.

Electrical World, May 4, 1970. 39 p, 1 fig, 1 tab.

Descriptors: *Cooling towers, Thermal pollution, Dispersion, Computer programs.
Identifiers: *Plume lengths.

Kaylor and associates used a mathematical model developed for stack dispersion studies and adapted it for cooling-tower use. A Stone and Webster computer program called CLOUD was developed to use psychrometric charts, and the Pasquill-Turner stability classes. The program input requires a water-vapor emission rate from a cooling tower, tower height and diameter, wind speed, stability classes, downwind distances and relative humidities with corresponding ambient dry-bulb temperatures. The output includes the values of the visible plume lengths at the specified conditions. The predicted plume lengths were, on the average, 21% higher than the observed values. Neglect of plume rise is probably the cause of the somewhat higher predicted values. (Upadhyaya-Vanderbilt)

CONDITIONS OF RECIRCULATION OCCURRENCE AT COOLING WATER INTAKE (In Polish),
Adam Widomski.
Gospodarka Wodna, 1970, No 1, p 3-7. 11 fig, 5 ref.

Descriptors: *Cooling, Streams, *Thermal powerplants, *Heat balance, Thermal stratification, *Thermal pollution, Temperature, Water temperature, Thermal conductivity.

Experimental investigations concerning some river sectors in the vicinity of warm water outflow in power plants have been carried out in models under the conditions of plant operation. Current directions and the occurrence of recirculation have been perceived. The recirculation is dependent on the Froude number, the quantity of water taken up from rivers and the distance between the points of the water outlet and the water intake. The results of the investigations enable estimations of the limit conditions of the occurrence of recirculation and its consequences for cooling water intake from streams. Significant stratification in streams has been observed. For regular river channels the occurrence of the recirculation can be described by the following: Froude number, the intake-outlet nondimensional ratio delta L/B where B is width of stream, and nondimensional flow ratio Qu/Qo where Qu is the cooling water intake rate and Qo is the original flow in the river. (Novotny-Vanderbilt)

USE OF ISOTOPIC DECAY RATES IN TURBULENT DISPERSION STUDIES,
Weizmann Inst. of Science, Rehovoth (Israel).
M. Beran, and G. Assaf.
Journal of Geophysical Research, Vol 75, No 27, p 5279-5285, September 20, 1970. 7 p, 3 fig, 16 ref.

Descriptors: *Radioactivity techniques, *Diffusion, *Dispersion, *Turbulent flow, Mixing, Tracers, Path of pollutants, Analytical techniques, Radioisotopes, Radioactive dating, Radioactivity.
Identifiers: Isotopic decay rates.

The differences in isotopic decay rates can be used to determine information about time-dependent turbulent dispersion from steady-state measurements. Mean horizontal transport results from vertical turbulent dispersion coupled with a mean horizontal wind that has a vertical gradient. Applications to atmospheric and oceanographic conditions are discussed. If it is possible to measure the steady-state vertical concentration gradient resulting from an infinite plane source, the time-dependent vertical concentration distribution resulting from an instantaneous point source can be calculated. This information can then be used to determine the mean horizontal transport. Atmospheric dispersion of natural isotopes emanated from the ground is discussed in the context of this solution. (Knapp-USGS)

TRITIUM IN CRATER LAKE, OREGON,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
H. James Simpson.
Journal of Geophysical Research, Vol 75, No 27, p 5195-5207, September 20, 1970. 13 p, 5 fig, 9 tab, 20 ref. AEC Grant AT (30-1) 2493.

Descriptors: *Tritium, *Fallout, *Lakes, *Craters, Hydrologic budget, Water balance, Seepage, Evaporation, Hydrogeology, Mixing, Precipitation (Atmospheric), Sampling.
Identifiers: Crater Lake (Oregon).

Input by precipitation can explain most of the tritium content of Crater Lake, Oregon. The hydrology of Crater Lake makes it ideal for this study because less than 1/2 of 1% of the lake volume is lost from the lake by vapor exchange because the surface concentration is diluted by vertical mixing. If Crater Lake has retained nearly all its input tritium, and if less than half of this input was supplied by vapor exchange as derived from budget calculations, deep lakes with small drainage basins can provide good estimates of the total tritium rainout. (Knapp-USGS)

A REVIEW OF CHLORINATED BIPHENYL CONTAMINATION IN NATURAL WATERS,
Wisconsin Univ., Madison, Water Chemistry Lab.
Gilman D. Veith, and G. Fred Lee.
Water Research, Vol 4, No 4, p 265-269, April 1970. 5 p, 28 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Organic compounds, *Pollutant identification, *Reviews, *Water pollution sources, Chromatography, Gas chromatography.
Identifiers: Chlorinated biphenyls.

A review of the present state of knowledge concerning environmental contamination by organochlorine compounds indicates that the chlorinated biphenyls may be one of the more widespread contaminants. The significance of this contamination has not yet been evaluated due, in part, to the lack of systematic analytical procedures for the quantitative and qualitative determinations of the components of chlorinated biphenyl mixtures. The possibility of the chlorinated biphenyls producing serious errors in chlorinated pesticide analyses is emphasized. (Knapp-USGS)
W70-10277

AN ECONOMIC MODEL FOR A POLLUTED RIVER SYSTEM,
V. K. Collinge, D. H. Newsome, A. L. Downing, and J. Renold.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-6. 7 p.

Descriptors: *Mathematical models, *Dissolved oxygen, *Biochemical oxygen demand, *Water quality, *Pollution abatement, Water pollution control, Chlorides, Economic benefits, Ammonia.

The river Trent in England is undergoing an extensive systems analysis, in order to derive technical and economic solutions to its severe pollution problems. The river's tributary, the Tame, drains the Birmingham industrial area with a population of 2.1 million. The Trent River authority needs to develop additional water supplies from the river. The economic modelling requires quantitative relationships between cost, quality, quantity, use and benefit. A key concept is 'quality state', meaning an ordered set of concentrations of water quality constituents. (This appears similar to term 'objective sets' used by Delaware River Basin Commission). Substances such as chlorides and suspended solids are found to act conservatively but BOD, dissolved oxygen and ammonia were analyzed using the Streeter-Phelps relationships. Dynamic programming has been chosen for the mathematical modelling, considering the river to consist of a number of reaches or stages. Methods of evaluating benefits of various quality states are being worked out. (Whipple-Rutgers)
W70-10370

WATER QUALITY AND MANAGEMENT EXPERIENCES OF THE DELAWARE RIVER BASIN COMMISSION,
Delaware River Basin Commission, Trenton, N.J.
J. F. Wright, and R. Porges.
Fifth International Water Pollution Research Conference, San Fracisco, July 26-August 1, 1970. Preprint, Paper I-3. 17 p.

Descriptors: *Mathematical models, *Dissolved oxygen, *Biochemical oxygen demand, *Water quality, *Pollution abatement, Water pollution control.
Identifiers: Objective sets, Water quality enforcement zones, BOD allocation.

Although technical aspects of water quality control are within our grasp, and general public support is available, there remain knotty public policy problems to be solved. Experiences of the Delaware River Commission should aid in solving these problems. The mathematical modelling of the biochemical oxygen demand regimen of the Delaware estuary represents the primary pollution problem of the basin. This modelling, originally accomplished by a steady-state assumption has now been elaborated into a time varying model more representative of tidal flows. With the use of this model, costs may be obtained of various alternative sets of standards, called objective sets. In terms of detailed implementation, the ideal least cost solutions proved impracticable; standards are therefore set by zones, and each facility is given an allocation in terms of primary BOD. As implementation of these controls continues, principles and procedures are being developed which should be applicable in other basins. (Whipple-Rutgers)

Plaintiff United States brought libel against defendant vessel under a federal statute which prohibits the discharge of refuse into navigable waters of the United States. Defendant threw garbage into Honolulu harbor by its agent; however, defendant had attempted to prevent the discharge, and proved at trial that the discharge was unintentional and not for want of due care. Defendant contended that the unintentional discharge did not violate the statutory prohibition. The court ruled that the wording of the statute did not require intent or lack of due care for liability, being simply a prohibition of refuse discharge with an accompanying sanction. Interpreting the statute as holding any vessel strictly liable for refuse discharge, the court affirmed the decision of the lower court for plaintiff. (Hart-Florida)

Identifiers: *Enterobacteriaceae, Danube River, Enterococci, Ammonizing bacteria, Leptospirae, Microbial plankton, Anaerobic sporulating clostridia, Beet-sugar, Austria, Moravia, Fecal pollution.

A study of regularities in number of microbes in water in the course of the year under the influence of physical, chemical, and biological factors in natural biotope and also of some chosen phenomena in laboratory experiments is described. Factors influencing survival of bacteria of the family Enterobacteriaceae in water in a positive and negative sense are evaluated with the objective to utilize natural elements of the water medium--bacterial antagonism--resulting in prompt elimination of bacteria from water. For indicators of fecal contamination of water (using membrane filters) the number of colonies of Enterobacteriaceae, enterococci, and anaerobic sporulating clostridia are determined. A major ecological factor influencing bacteria numbers in water is flow-rate per second. In biotope investigated, total count of microbes is in inverse proportion to water flow-rate. A reverse

correlation to flow-rate is shown also by heterotrophic bacteria cultivated at 20C and 37C, as well as the determined indicators of fecal contamination, Enterobacteriacea, enterococci, and anaerobic sporulating clostridia. While in the case of Enterobacteriaceae a positive correlation exists, relationships between the number of enterococci and clostridia to the temperature is reversely proportional. (Jones-Wisconsin)

Annals of the Entomological Society of America, Vol 63, No 2, p 397-400, 1970. 3 tab, 4 ref.

Descriptors: *Water pollution effects, *Organic wastes, *Aquatic insects, Habitats, Impounded waters, Coliforms, Mosquitoes, Lagoons, Indicators, Livestock, Water pollution sources.
Identifiers: Swine, Lagoon studies, Culex pipiens quinquefasciatus, Escherichia coli, Escherichia freundii, Escherichia intermedia, Aerobacter aerogenes, Coptotomus, Hydrous triangularis, Chironomus plumosus, Chaoborus, Brachydeutera, Musca domestica, Psychoda, Hermetia illucens, Stratiomys, Eristalis aeneus, Tabanus, Odonata.

The relative effects of organic waste pollution on the aquatic insect fauna of a freshly dug livestock waste disposal lagoon was studied. Introduction of organic waste material from swine pens into impounded aquatic habitat caused suppression of certain insect species. Decreases in aquatic insect fauna paralleled the increase in the organic waste concentration determined by changes in the numbers of coliform bacteria. The southern house mosquito, Culex pipiens quinquefasciatus Say, began laying eggs in the lagoon when coliform counts approximated 7000 organisms per milliliter of lagoon water. Water suspensions of pure cultures of coliforms Escherichia coli, E freundii, and E intermedia were found to be more attractive as oviposition sites for C p quinquefasciatus than water suspensions of Aerobacter aerogenes or sterile water. The change in insect fauna in the new lagoon during the 2-1/2 years' study was considered to be directly related to the change in the organic waste pollution of the water. The data obtained indicate the possibility of using aquatic insects as biological indicators of water quality. (Jones-Wisconsin)

EUTROPHICATION SPEEDED BY MAN,
Richard H. Gilluly.
Science News, Vol 98, No 1, p 17-19, July 4, 1970. 4 fig.

Descriptors: *Eutrophication, *Phosphorus, *Nitrogen, Sewage disposal, *Detergents.
Identifiers: *Lake Washington, Lake Tahoe, Lake Erie, Lake Monona, Lake Sebasticook, Secchi Disk.

Disposal of intolerable amounts of phosphorus and nitrogen are speeding up the eutrophication process of lakes in North America and throughout the world. These nutrients stimulate plant growth and turn the lake into a marshy foul-smelling, fish killing, oxygen lacking body of water. A great deal of this accelerated eutrophication is the direct result of sewage disposal into the lakes. Detergent phosphates and nitrates are also potent accelerating forces. Although the causes have been identified, the cure is often very difficult to administer because of political and economic obstacles. The 'most obvious' solution is to divert sewage to another outlet or to subject it to tertiary treatment. (Holmes-Rutgers)

COOLING-TOWER EFFECTS: STUDIES ABOUND,
IIT Research Inst., Chicago, Ill.
E. Aynsley.
Electrical World, May 11, 1970, p 42-43. 3 fig.

Descriptors: *Cooling towers, Humidity, Precipitation (Atmospheric), *Environmental effects.
Identifiers: Keystone generating station, Stack gases, *Climatic conditions.

There is some apprehension today that cooling-tower emissions may produce undesirable environmental effects. Inadvertent weather effects, including local fogging and icing, cloud formation, and increased precipitation are often cited as possibilities. Initial results from ground and aerial studies being conducted by IIT Research Institute of Chicago at 1800-Mw, Keystone Generating Station indicate that no immediate problems appear to exist. There were 16 towers operational at the end of 1969 in U.S. Current projections indicate 33 towers within the next two years. Measurements of cooling-tower plume profiles indicate that humidity increases can be detected for many miles downwind. Little information is currently available concerning cumulus-cloud initiation, and it is hoped to gather further information in this area. Keystone burns 600 tons per hour of coal, which gives rise to some 20 tons per hour of SO2 emitted in the stack gases. (Upadhyaya-Vanderbilt)

MERCURY IN GREAT LAKES FISH,
Bureau of Commercial Fisheries, Ann Arbor, Mich.
Harry L. Seagran.
Linnos, Vol 3, No 2, p 3-10, 1970. 2 fig.

Descriptors: Heavy metals, *Great Lakes, *Public Health, Water pollution effects, Water pollution sources, Fish harvest, Inspection, Legal aspects, *Monitoring, On-site investigations, Industrial wastes, Pulp and paper industry, Pulp wastes, Economic impact, Lake Huron, Lake Erie.
Identifiers: *Recommendations, *Mercury, Fishing closures, Chlor-alkali plants, Minamata disease, St. Clair River.

This article summarizes statements by public agencies and the private sector dealing with mercury contamination introduced before the Subcommittee on Energy, Natural Resources and the Environment of the Senate Committee on Commerce. The development of the current situation, sources of contamination, background on mercury contamination, economic assessment of losses due to mercury contamination, a description of current BCF research, and a list of recommendations are discussed. The recommendations stress the need to identify all sources of mercury pollution and determine the fate and toxic effects of mercury in the environment. (See also W70-10322) (Katz-Washington)

THE MERCURY THREAT: QUESTIONS TO CONSIDER,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
Richard Copeland.
Limnos, Vol 3, No 2, p 11-13, 1970. 2 fig.

Descriptors: Heavy metals, *Great Lakes, Lake Erie (Geochemistry), Trace elements, Water pollution sources, Water pollution effects, Fungicides, Regulations, Lethal limit, Industrial wastes, Pulp and paper industry, *Pulp wastes, *Food chains, *Path of pollutants, *Public health persistence.
Identifiers: *Mercury pollution, Lake St. Clair, Chlor-alkali plants, Minamata disease, *Concentration mechanisms.

This paper discusses the basics of the mercury pollution problem. Mercury is used in industry in two forms, metallic mercury as an electrode in the production of chlorine and alkalis, and organic mercury compounds. The latter are as slimicides used in the pulping industry. Mercury is incorporated and accumulated in fish in two ways. Via the gills as an equilibrium is set up between mercury in fish and water. The second method is ingestion of mercury contaminated food. The author gives a calculated guess as to how long a mercury polluted environment will stay polluted after stopping mercury input. In the case of the Lake Erie - St. Clair system an estimate of 10-100 years is given. (See also W70-10321) (Katz-Washington)

A SHORT HISTORY OF MINAMATA DISEASE RESEARCH AND THE PRESENT SITUATION OF MERCURY POLLUTION IN JAPAN,
Tokyo Univ. (Japan). Dept. of Sanitary Engineering.
Jun Ui.
Nordiskt symposium Kring Kvicksilverproblematiken, held in Lidingo, Sweden, 10-11, Oct. 1968, No 2, Band 50, 1969, Nordiskt Hygienisk Tidskrift, p 139-146. 20 ref, 4 fig.

Descriptors: *Public health, Heavy metals, History, Industrial wastes, On-site investigations, Water pollution effects, Water pollution sources, Fungicides, Toxicity, Diseases.
Identifiers: *Minamata disease, *Mercury pollution, Japan, Acetaldehyde synthesis, Disease symptoms.

The discovery of Minamata Disease and its cause are documented. It is caused by consuming fish and shellfish which contain low-molecular normal alkyl mercury. The source of mercury pollution was the Minamata Factory which used mercury in the acetaldehyde synthesis process. The symptoms of the disease, mainly impairment of motion, speech, sensation, vision, and hearing are described and quantified. The Japanese have realized their problem and are now trying to alleviate all mercury pollution. (Katz-Washington)

THE EFFECTS OF INDUSTRIAL WASTES OF MEMPHIS AND SHELBY COUNTY ON PRIMARY PLANKTONIC PRODUCERS,
Christian Bros. Coll., Memphis, Tenn.
R. Staub, J. W. Appling, A. M. Hofstetter, and I. J. Haas.
Bio Science, Vol 20, No 16, p 905-912, 1970. 4 fig, 3 tab, 10 ref.

Descriptors: *Water pollution effects, *Industrial wastes, Tennessee, Mississippi River, *Bioindicators, *Plankton, Diatoms, Correlation analysis, Phytoplankton, Chlorides, Chromium, Hardness (Water), Environmental effects, Biochemical oxygen demand, *Water temperature, Hydrogen ion concentration, Dissolved oxygen, Carbon dioxide, Silica, Turbidity, Manganese, Iron, Copper.
Identifiers: Memphis, Sky cover, Pennate counts, Centric counts, Diversity indexes.

Use of plankton analysis as an indicator of degree of pollution in a complex aquatic community is a promising area of investigation because of the role of plankton as primary producers. Correlation studies have indicated that water temperature is the major controlling influence in regulating both kinds and numbers of individuals. The iron content of the water samples surveyed had the next highest correlation with plankton numbers, and it was a consistently negative correlation. Turbidity of the waters sampled likewise showed considerable negative correlation with numbers of plankton. Total hardness (calcium and magnesium) and chloride content showed good correlation with numbers of plankton positive organisms. No significant correlations were found for copper, carbon dioxide, and chromate content of the water with or sky cover in relation to number of organisms. Very few significant correlations were obtained for dissolved oxygen, manganese or silica content, or for pH. However, given a sufficient run, or flow, through relatively nonpolluting regions, and a natural dilution (increase in volume), a stream can greatly improve its quality by development and activity of its plankton community. (Katz-Washington)

HEMATOLOGICAL EFFECTS OF APHOLATE ON CHANNEL CATFISH (ICTALURUS PUNCTATUS),
Mississippi Univ., Jackson. Dept. of Biochemistry.
Charles L. Dodgen, and Sue Sullivan.
Proceedings of the Society for Experimental Biology and Medicine, Vol 131, p 124-126, 1969. 10 ref, 2 tab. USPHS Grants EF 00438, ES 00137, and CC 00271.

Descriptors: *Channel catfish, Fishkill, *Fish physiology, Bioassay, Toxicity, Lethal limit, Mode of action.
Identifiers: *Apholate, Alkylating agents, *Hematological effects, Erythrocyte counts, Leukocyte counts, Thrombocytes, *Blood cell counts, Histological examination.

Channel catfish fingerlings were given oral doses of apholate, 200 mg/kg and 400 mg (Apholate/kg body weight), an alkylating agent. Total erythrocyte, total leukocyte, and differential leukocyte counts were made to determine hematological changes produced by apholate. The changes in erythrocyte counts of animals receiving apholate at both levels were not significantly different from the control. The total leukocyte counts were significantly lower in the treated fish. There was less of an effect upon the thrombocytes. The lower dose used in the experiments approximates the LD50 of 191 mg/kg, determined at 14 days post-treatment. The LD50 decreases to 124 mg/kg at 30 days, but no deaths occurred in less than 8 days, regardless of dose. (Katz-Washington)

ESTUARINE MEASUREMENTS FOR PRODUCTIVITY AND EVALUATION OF SYSTEM WASTE DISCHARGE EFFECTS,
Texas Univ., Austin.
E. M. Davis, and W. W. Eckenfelder.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint. 9 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Estuaries, *Productivity, *Photosynthesis, *Respiration, Water pollution effects, Chlorophyll, Diurnal distribution, Dissolved oxygen.
Identifiers: Species diversity index.

The overall productivity of two estuarian systems on the Texas coast, namely Taylor Bayou and Chocolate Bayou, was evaluated and the seasonal effects of chemical waste discharges on the ecology of the systems was estimated. The variation of productivity by season of the year over a two-year period was established by field analysis which included the measurement of gross photosynthesis and respiration and the species diversity index in each system. These results were compared to laboratory data using waste samples taken from each estuary. It was established that the community productivity and the effects of additions of chemical process wastes could be determined under laboratory conditions. Chlorophyll-a response varies with the population quite extensively and can increase due to phytoplankton increases. The nutritive benefit is therefore quite rapid for some wastes. Even with increases of chlorophyll-a concentrations some photosynthetic supression may occur due to a concurrent toxic effect by the waste. Diversity indexes decreased most often due to the toxic effect of the wastes on the zooplankton. The dinoflagellates are more seriously effected, followed by the green algae, diatoms then bluegreens. Application of the principles involved herein are by no means limited to the estuaries of Texas coast, and may be applied to any aquatic ecosystem regardless of the hemisphere in which it is located. (Hancuff-Texas)

NUTRIENT REGENERATION IN LAKES AND OCEANS,
Georgia Univ., Athens. Dept. of Zoology.
R. E. Johannes.
Advances in microbiology of the sea, Academic Press, New York, 1968. Vol 1, p 203-213. 1 fig, 1 tab, 68 ref.

Descriptors: *Nutrients, *Lakes, *Oceans, *Organic matter, *Decomposing organic matter, Nitrogen, Phosphorus, Aquatic plants, Aquatic animals, Ecosystems, Food chains, Zooplankton, Bacteria, Detritus, Herbivores, Carnivores, Phytoplankton, Georgia, New York, Rhode Island, Metabolism.
Identifiers: *Nutrient regeneration, Long Island (N Y), Doboy Sound (Ga), Narragansett Bay (R I), Cayuga Lake (N Y), Cape Breton Island (Canada).

Nutrient regeneration is defined as the release of soluble organic or inorganic plant nutrients by or from organisms or their remains. This discussion is limited to nitrogen and phosphorus. It has been demonstrated that most nitrogen and phosphorus incorporated into aquatic plants and animals is usually regenerated by processes other than direct bacterial action. Nutrient regeneration rates and bacterial numbers are not correlated. Bacteria are instrumental in nutrient regeneration indirectly by converting detritus into a form utilizable by bacteria-feeders. It is these bacteria-feeders which appear to accomplish much of the nonautolytic regeneration of nutrients from detritus. Pathways of phosphorus and nitrogen flow in aquatic ecosystems are generally dominated by grazing food chains; much of the phosphorus and nitrogen assimilated by plants is subsequently ingested, metabolized and released in soluble forms by zooplankton. A substantial remainder is released from organiz detritus by autolysis and solution. Bacteria facilitate nutrient regeneration from residue by assimilating detrital nutrients, thus rendering them available to bacteria-feeders which subsequently excrete them. Bacteria appear to account directly for only a minor fraction of nutrient regeneration and at times actually compete with plants for nutrients. (Jones-Wisconsin)

THE EXTENT OF NITROGEN AND PHOSPHORUS REGENERATION FROM DECOMPOSING ALGAE,
Kentucky Univ., Lexington. Dept. of Civil Engineering; Texas Univ., Austin. Dept. of Civil Engineering; and Stanford Univ., Calif. Dept. of Environmental Engineering.
E. G. Foree, W. J. Jewell, and P. L. McCarty.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint. 15 p.

Descriptors: *Eutrophication, *Algae, *Decomposing organic matter, Nutrients, Surface waters, Nitrogen, Water quality, Phosphorus, Aerobic conditions, Anaerobic conditions, Chlorella, Chlamydomonas, Scenedesmus, Effluents, Oxidation lagoons.
Identifiers: San Pablo Estuary (Calif), Sacramento River (Calif), Searsville Lake (Calif), San Joaquin River (Calif), Nitzschia.

Decomposition of monospecific and heterogenous algae and subsequent release of nutrients were investigated in dark-aerobic and dark-anaerobic cultures. Under aerobic conditions, 50% on the average of the initial particulate nitrogen and phosphorus were regenerated, but the recovery varied from zero to nearly 100%. Under anaerobic conditions, the average regeneration of nitrogen and phosphorus was 40% and 60%, respectively, with variation nearly as great as that for aerobic decomposition. A general agreement between equation-predicted nitrogen and phosphorus refractory values and measured values was obtained. The results suggest that chances for a successful control of eutrophication are much greater before refractory remains of algae have been permitted to accumulate. (Wilde-Wisconsin)

MICROBIAL RELEASE OF SOLUBLE PHOSPHATE IN AN ACTIVATED SLUDGE ENVIRONMENT,
Virginia Polytechnic Inst., Blacksburg. Dept. of Civil Engineering.
Clifford W. Randall.
Available from NTIS as PB-194 453, $3.00 in paper copy, $0.65 in microfiche. Completion Report, August, 1970. 10 p, 6 ref. OWRR Project A-024-VA (1).

Descriptors: *Water pollution control, *Waste water treatment, *Biological treatment,

*Phosphates, *Phosphorus, Oxygen, Sewage effluents, Sludge, *Activated sludge, Hydrogen-ion concentration, Oxidation-reduction potential.

Batch type laboratory units were used to study the mechanisms and factors that determine the amount of soluble phosphate that will be released from activated sludge during typical plant operation. In addition to studying the effect of typical operational factors such as rate and duration of aeration, organic loading rate, and duration of anaerobiosis, emphasis was placed on determining whether activated sludge phosphate release is primarily a chemical or a biological phenomenon. The experimental results demonstrate that the release of soluble phosphate from activated sludge is basically a biological phenomenon and that it is relatively independent of the chemical environment as measured by pH and ORP, within the normal range of waste treatment operation. Such release is a strong function of parameters that affect cellular metabolism such as D.O. The release of phosphate occurs under both aerobic and anoxic conditions but the amount released during anoxia is considerably greater and it is released much more rapidly. The magnitude and rapidity of release under any conditions is directly proportional to the biological stress imposed on the system. Release during anoxia can be retarded by preceding high aeration rates and significant amounts of organic substrate.
W70-10112

ENHANCEMENT OF WATER QUALITY USING FOREST-DERIVED COAGULATING SYSTEMS. PART I. THE COAGULANT AND DISPERSANT CHARACTERISTICS OF LIGNOSULPHONATES,
Washington Univ., Seattle. Inst. of Forest Products.
G. G. Allan, and D. D. Halabisky.
Pulp and Paper Magazine of Canada, Vol 71, No 2, p T50-T56, January 16, 1970. OWRR Project A-019-WASH.

Descriptors: *Wastewater treatment, *Water quality, *Pulp wastes, Lignins, Kaolimite, Pulp and paper industry, *Coagulation.
Identifiers: Lignosulfanates.

Lignosulphonates isolated directly from pulp waste liquor are shown to function as dispersants or coagulants depending on their molecular weight. The high molecular weight material (i.e., equal or greater than 0.15 dl./g.), in association with alum is a more effective combination for the removal of colloidal pollutants from water than alum alone. Coagulation mechanisms are discussed, and evidence is presented to show that after reduction of the zeta potential of the contaminant particles by the alum, the large lignosulfonate macromelecules create fast settling flocs by interparticular bridging. (See also W70-10115)
W70-10116

NITRATE REMOVAL FROM ACTIVATED SLUDGE SYSTEMS,
Washington Univ., Seattle. Dept. of Civil Engineering.
Dale A. Carlson.
Available from NTIS as PB-194 457, $3.00 in paper copy, $0.65 in microfiche. Completion Report, July 15, 1970. 35 p, 7 tab, 7 fig, 37 ref. OWRR Project A-026-WASH (1).

Descriptors: *Nitrification, *Denitrification, Water quality control, Eutrophication, *Activated sludge, *Waste water treatment.
Identifiers: *Nitrate removal.

Pilot plant studies of nitrification-denitrification in activated sludge facilities treating domestic waste waters provided equations and printouts for design of nitrification and denitrification units. For nitrification tank design, a computer program and printouts were developed which present the equation in graphical form to facilitate use. The equation printouts provide minimum retention times necessary to achieve consistent nitrification. The oxygen requirement for full nitrification was 4 mg/l and the percent nitrification dropped with loading factors above 0.2 lb BOD5 per day per pound of mixed liquor suspended solids. In the denitrification unit the percent nitrate removal diminished with increasing dissolved oxygen supporting the theory that complete anaerobiosis is necessary for maximum denitrification. The rate of nitrate removal was directly dependent on the mixed liquor volatile suspended solids concentration of the denitrifying. The denitrification equation developed defines the minimum sludge concentration necessary for complete reduction of nitrates. While the constants in the equation solutions are gased on all weather conditions in the Pacific Northwest, a method for evaluating equation constants provides the means of applying the equation to any location.
W70-10118

EVALUATION OF PYRRONES AS MEMBRANES,
Franklin Inst. Research Labs., Philadelphia, Pa.
H. Scott, and F. L. Serafin.
Available from NTIS as NASA CR-1648, $3.00 in paper copy, $0.65 in microfiche. NASA CR-1648, September 1970. 35 p, 8 tab, 15 fig, 10 ref. NASA Contract NASl-8609.

Descriptors: *Membranes, *Waste water treatment, Membrane processes, *Reverse osmosis, *Osmosis, *Absorption, Plastics, Films, Desalination.
Identifiers: Polymidazopyrrolones, Pyrrones, Urine purification, *Polymers.

The facile absorption of water by polyimidazopyrrolones (Pyrrones) suggested a feasibility study to use films of the polymers as membranes for the purification of water by reverse osmosis. Direct osmosis measurements of water, salt, and urea fluxes through Pyrrone membranes are described. The data indicate comparable flux values and superior water-to-salt permeabilities of the Pyrrones relative to symmetric cellulose acetate membranes. Coupled with better mechanical strength and chemical resistance, these results suggest that the successful fabrication of asymmetric Pyrrone membranes could lead to substantial improvements over asymmetric cellulose acetate, from which the best reverse osmosis membranes are currently prepared.

ALGAL RECORDS FOR THREE INDIANA SEWAGE STABILIZATION PONDS,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
C. Mervin Palmer.
Proceedings of the Indiana Academy of Science, Vol 78, p 139-145, 1968. 3 tab, 8 ref.

Descriptors: *Sewage lagoons, *Algae, *Sewage treatment, *Indiana, Chlorophyta, Cyanophyta, Diatoms, Seasonal, Euglena, Chlamydomonas, Chlorella, Scenedesmus, Sampling, Oxydation lagoons.
Identifiers: Blue-green algae, Nitzschia, Biological studies, Algal identification.

Three sewage stabilization ponds in southeastern Indiana were among several throughout the United States selected for biological studies, with particular emphasis on the algal flora. Algal identifications have been recorded from 376 samples collected from the ponds during a period from May 1962 to August 1968. Although certain genera were found frequently in all three ponds, each pond had a distinctive algal flora. Green algae were invariably the most abundant; however, flagellates were also prominent. Of a total of 64 genera of the most significant and abundant algae there were 29 green algae, 19 flagellates, 10 blue-green algae, and 6 diatoms. Some genera were limited to the summer season, while others were most prominent in spring and fall or in winter. The pollution-tolerant algae, Euglena and Nitzschia, were abundant and persistent in all three ponds. The biochemical oxygen demand at the intakes was about 500 ppm and for the effluents less than 50 ppm. The first virus infecting a blue-green alga was isolated from one of the ponds in Ripley County. (Jones-Wisconsin)
W70-10173

FILTRATION OF ALGAL SUSPENSIONS,
Bohna Engineering and Research Inc., San Francisco, Calif.
I. J. Wright, and W. M. Luiz.
Bohna Engineering and Research, Incorporated, San Francisco, California, Bohna Internal Report F170, 1970. 31 p, 7 fig, 10 tab.

Descriptors: *Waste water treatment, *Filtration, *Algae, *Suspension, Harvesting, Ponds, California, Scenedesmus, Suspended load, Nitrates, Calcium carbonate, Proteins, Filters, Engineers estimates, Economics, Feasibility, Costs, Annual costs, Pilot plants.
Identifiers: Firebaugh (Calif), Volatile solids, Sanborn filter, Backwashing.

The Sanborn Filter, proprietary of Bohna Engineering and Research, Inc, a fabric and granular-media device, has been evaluated for use in harvesting algae from ponds of the Agricultural Waste Water Treatment Center at Firebaugh, California. Removals of up to 98% have been achieved without the use of flocculants or other chemical additives. The backwash from the filter has suspended solids concentrations up to 1.7% which shows evidence of increased coagulation, allowing the concentration of solids to a level of 8% to 12% by simple sedimentation. An economic analysis of the use of algae for nitrogen stripping of San Joaquin Valley drainage water was made. Assuming a flow sheet which includes lined, mixed growth ponds followed by filtration with the Sanborn Filter, concentration of the backwash by sedimentation or centrifugation and air drying of the algae, an approximate total cost of $37.01 per million gallons treated is projected, based on amortization and interest charges of 10% per year of the initial investment. Capacity of 700 million gallons per day was assumed. (Jones-Wisconsin)

CONTROL OF THERMAL EFFECTS AT BEAVER VALLEY STATION,
Duquesne Light Co., Pittsburgh, Pa.; Worcester Polytechnic Inst., Mass; and Stone and Webster Engineering Corp., Boston, Mass.
Robert J. McAllister, Lawrence C. Neale, and Bruno Brodfeld.
Journal of the Power Division, Proceedings of ASCE, Vol 96, No PO3, Proc Paper 7319, June, 1970, p 287-298. 9 fig.

Descriptors: *Thermal pollution, *Cooling towers, Effluents, Jets, Mixing, Powerplants, Rivers, Temperature, Flumes, Froude number, Outlets, Waste dilution.
Identifiers: Entrainment.

By combining a once-through condenser water system with a supplemental cooling tower, the required temperature criteria can be met in the operation of Beaver Valley Station, even for the minimum discharge. On the average cooling tower assistance is necessary only two to three months each year, but not continuously. A feature of the site is the local configuration of Ohio River which branches into a main navigable channel and a smaller back channel, with the plant outlet located on the river. Field studies and model tests were carried out to investigate means for improving river flow distribution. The model comprised approximately a 2-mile reach of the river at a horizontal scale of 1:125 and a vertical scale of 1:25. It was found that the outlet orientation could be optimized to ensure maximum river flow entrainment into the back channel by the discharged jet. Analysis and tests results showed that warm water recirculation between discharge and intake structures would be adequately controlled by increasing effluent dilution in the back channel. Temperature patterns at the surface and in cross sections were determined on the model for a two mile long river beach. (Upadhyaya-Vanderbilt)
W70-10215

WASTE HEAT DISPOSAL FROM POWER GENERATING STATIONS,
Federal Power Commission, Washington, D.C.
F. S. Brown.
Journal of the Power Division, Proceedings of ASCE, Vol 96, No PO3, Proc Paper 7317, June, 1970, p 277-286.

Descriptors: *Thermal pollution, *Cooling water, Condensers, Cooling towers, Thermal powerplants, Water quality.
Identifiers: *Waste heat.

Steam-electric plants, nuclear or fossil fueled, are expected to provide the bulk of the growing needs for electric energy. As part of the operating cycle, such plants require large flows of water through the condensers to convert the exhaust steam to water. The condenser cooling water absorbs large amounts of waste heat which must be dissipated in some manner. The types of cooling systems in use include once through, cooling ponds, and cooling towers of either mechanical or natural draft design. Cooling towers are used where water supplies are limited or water quality standards prevent use of streams or lakes for waste heat disposal. Cooling towers add to power costs and are aesthetically undesirable. The addition of heat to water bodies may produce adverse effects on aquatic organisms. Although substantial studies have been completed or are under way, additional research is needed on the waste heat disposal problem. Areas of necessary research include the biological effects, the transport and behavior of heat in water, improved methods of cooling, and means of making beneficial use of waste heat. (Upadhyaya-Vanderbilt)

TECHNICAL NORMS FOR COMPUTATION OF COOLING PONDS (In Russian).

Gosudarstvennoe Energeticheskoye Izdatel'stvo, Moscow, 1963. 103 p, 13 fig.

Descriptors: *Cooling, Ponds, Temperature, Heat balance, Heated water, Evaporation, Convection, Energy transfer, Thermal stratification, Heating, Water cooling, *Thermal powerplants, *Thermal pollution, Radiation.
Identifiers: *Cooling ponds.

The norms presented here are determined for the practical design of cooling ponds serving steam-electric power plants. The cooling ponds are classified according to purpose, hydrological conditions, design parameters, and exploitation. As to hydraulic design the ponds can be divided into two groups: (a) ponds with a great degree of B/Bo ratio, (B-width of pond, Bo-width of intake), and (b) ponds with a small B/Bo degree. A critical ratio is B/Bo—6. The norms present a means of computation of active cooling surface area and active cooling specimen volume of the pond. The temperature computation uses the energy budget approach and presents all formulae necessary for temperature and temperature decay computations. An example of the computation of a cooling pond is solved and presented. (Novotny-Vanderbilt)

Descriptors: *Water treatment, *Water purification, *Tertiary treatment, Pesticide removal, Filtration, Desalination, *Waste water treatment, *Electrophoresis, *Electrochemistry, Electrolysis, Physicochemical properties, Chemical reactions, Water chemistry, Analytical techniques.

The direct use of electric currents and electric fields to bring about water clarification and purification was investigated. Electrophoretic and electrochemical systems appear well adapted for removal of these electrically charged pollutants and in addition have the potential of being entirely automated. Numerous design concepts are advanced and tested through the use of laboratory models. These include a parallel plate model which was designed entirely for electrophoretic removal, and porous filter and electrode grid models which incorporated both electrophoretic and electrochemical capabilities. Successful water clarification was attained with the parallel plate model only when the influent water was of very low electrical conductivity. Electrolysis products at high conductivities caused sufficient turbulence to completely disrupt electrophoretic transport. In addition, primary and secondary chemical reactions took place due to electrolysis, which altered the characteristics of the suspension. It was also concluded that the ease of automation with an electrophoretic system does not justify the high cost of water treatment by this method. Water purification by electrochemical means overcame this problem and was successful both operationally and economically. As a result of the experimental testing, an example design of a small semiautomated electrochemical water system is offered which incorporates electrochemical flocculation, settling and electrochemical disinfection operations.

AUTOMATIC WATER AND WASTE TREATMENT PLANTS IN OPERATION,
Stone (Ralph) and Co., Inc., Los Angeles, Calif.
Ralph Stone, and E. T. Conrad.
Civil Engineering, American Society of Civil Engineers, Vol 40, No 5, p 37-40, May 1970. 4 fig, 2 tab.

Descriptors: *Sewage treatment, *Water treatment, *Activated sludge, Filtration, Chlorination, Oxidation, Aeration, Cost, Waste water treatment, California.
Identifiers: *Napa-Berryessa Improvement District, *Automatic control, Clarification.

Water and waste treatment for the Napa-Berryessa Improvement District and Lake Berryessa in California depend on an automatic system. The water facilities are an intake structure; treatment plant which provides for taste, odor, and pH control clarification, filtration and chlorination; pump station; 7,000 ft transmission main; storage tank; and distribution system. The entire water system is controlled automatically using water levels at various points to start and stop the intake and booster pump stations. The intake pumps are mounted on a carrier and move up and down with the lake level. The system was designed for peak flows of 0.5 mgd, expandable to 1.0 mgd and ultimately to 4.0 mgd. The sewage facility treats a load of 0.175 mgd with easy expansion to 0.35 mgd incorporating an activated sludge plant followed by oxidation basins. Two booster pumps, controlled automatically by the level in the oxidation basin, pump the effluent to the disposal area. The treated waste is disposed through hillside irrigation employing 80 acres with natural slopes up to 1:1. The land was divided into four subdivisions, three sections intermittently irrigated by automatically controlled 50,000 gal storage tank, and the fourth section allowed to fully dry between dosings. Drainage ditches and a collection pond prevent contamination of lake waters. The total construction cost was $735,644 with $32,324 going for the automatic control system. (Sorber-Texas)

WATER REUSE AND RECYCLING IN INDUSTRY,
Engineering-Science, Inc., Austin, Tex.
J. Eller, D. L. Ford, and E. F. Gloyna.
Journal of the American Water Works Association, Vol 62, No 3, p 149-154, March 1970. 5 fig, 3 tab, 19 ref.

Descriptors: *Industrial water, *Water reuse, *Economics, Municipal waste water, *Cost analysis industries, Tertiary treatment, Pollutants, Waste water treatment.
Identifiers: *Water recycle.

The current status of industrial water reuse and recycling was surveyed by a presentation of representative case studies. In the majority of cases involving industrial reuse it is necessary to provide some form of treatment and several industries are using several forms of tertiary treatment in support of water reuse and recycle practices. Particular emphasis is placed on reuse of municipal waste waters by selected industries. An economic balance equation on water reuse was discussed and a simplified model establishing a basis for making economic decisions presented. (Waid-Texas)

TERTIARY TREATMENT OF WASTE WATER,
Michigan State Univ., East Lansing. Div. of Engineering Research.
K. L. Schulze.
Developments in Industrial Microbiology, Vol 9, p 175-185, 1968. 6 fig, 2 tab, 21 ref.

Descriptors: *Phosphates, *Waste water, *Waste water treatment, *Tertiary treatment, Coagulation, Electrodialysis, Reverse osmosis, Protozoa, Rotifers, Annelids, Activated carbon, Adsorption.
Identifiers: *Lake Tahoe Public Utility District, *Santee Valley, *Lebanon, Ohio, Epiphyton.

Using data obtained from continuous flow culture of bacteria, it was demonstrated that secondary waste water treatment processes are inherently incapable of attaining high grade removal of nutrients, especially nitrogen and phosphorus compounds. Activated sludge plants have maximum removal capability of 49% for nitrogen and 33% for

phosphate related to primary effluent. This necessitates the development of tertiary treatment. A survey of the physico-chemical and biological tertiary treatment methods and their results were presented. Special emphasis was placed on an attempt to assess the possibility of large scale nutrient removal by biological means. Pilot plants at Lebanon, Ohio and full scale operations at Santee Valley and Lake Tahoe Public Utility District plants in California were described. It is suggested that combination of a tertiary treatment slip with irrigation for crop production be used as a possible solution. It is urged that industry substitute another detergent filler for phosphates. (Waid-Texas)

THE CROSSNESS SEWAGE TREATMENT WORKS, GREATER LONDON COUNCIL: FIVE YEARS OPERATION 1963-68,
R. W. Horner, J. V. Stedman, F. G. Stark, and R. Davis.
Water Pollution Control, Vol 69, No 2, p 180-194, March-April 1970. 4 fig, 7 tab, 3 ref.

Descriptors: *Activated sludge, *History, *Sewage treatment, *Settling basin, *Screens, Sludge treatment, *Disposal, Performance, Biochemical oxygen demand, Waste water treatment.
Identifiers: *Extension, Detritus channels, London (England).

The operation and the basic design of sewage treatment works at Crossness, London are discussed. The new works was designed to handle a flow of 100 mgd in dry weather and a maximum flow of 216 mgd. The activated sludge plant is designed to treat a flow of 72 mgd to a 30:20 standard. Considering the heavy loading during storms, the performance of the six low level and four high level screens have been satisfactory. The grit removed from the detritus channels averages 121 cu yd/week. An improvement in the quality of the settled sewage coincides with the improved performance of the activated sludge plant. Primary sedimentation tanks are now capable of producing 120 mg/l SS when treating the dry weather flow. Performance of the activated sludge plant during the first and second year of operation is described. During the second year the treatment exceeded the design flow and difficulties were encountered due to overloading. The performances of primary and secondary sludge digestion are also presented. In general, the plant has operated well despite minor difficulties. (Shankar-Texas)

CITY OF OXFORD: EXTENSION TO SEWAGE-TREATMENT WORKS,
Oxford (England).
A. T. Morris, C. E. Copeland, and V. H. Lewin.
Water Pollution Control, Vol 69, No 3, May-June 1970, p 249-268. 7 fig, 5 ref.

Descriptors: *Sewage treatment, *Design, Effluent, Tertiary treatment, Biochemical oxygen demand, Sludge, Digestion, Organic loading, Dissolved oxygen, Sampling, Waste water treatment.
Identifiers: *Extension, *Clariflocculator tanks, *Storm sewage, Suspended solids, Flood lighting, Blower house, Magnetic flow meters, Automatic sampler, Oxford (England).

The sewage treatment works in the city of Oxford was originally designed to treat 5 mgd dry weather flow (dwf) from a population of 110,000 and to produce an effluent complying with a 30:20 standard. The extension has been designed for a dwf of 10 mgd from a population of 132,000 using an equivalent water consumption of 75 gal/hd d. The activated sludge process continued to be the best method, but to improve flexibility, and production of high quality effluent, additional parallel lanes of treatment were considered to be essential. Provisions for dealing with storm sewage was anticipated for this section of the extension. Other new features are rapid gravity sand filtration, rectangular secondary sludge digestion tanks and facilities for the separate consoldiation of surplus activated sludge. A sketch of the new primary and storm-sewage/balancing tanks, activated sludge plant the new final separating tanks are presented. Ram pumps deliver the sludge to the existing elutriation tanks after which it is pumped to the vaccum filtration plant for dewatering. Liquid sludge is distributed to farm land as a soil conditioner. Sewage flows and final effluent are measured by standing-wave flumes. (Shankar-Texas)

TANK CLEANING STATIONS FOR TANKERS,
Societe des Eaux de Marseille (France).
G. Bossy.
Fifth International Water Pollution Research Conference, San Frncisco, July 26-August 1, 1970. Preprint, Paper III-14, 6 p, July-August 1970. 2 tab, 2 ref.

Descriptors: *Water pollution control, *Oils, *Waste disposal, *Stations, Waste water treatment, Oil wastes, Cost.
Identifiers: *Tanks, *Oil tankers, Rinsing.

Ocean pollution by hydrocarbons results mainly from (1) accidental causes: due to errors in manoeuvering, collisions, grounding, acts of war, fracture of pipe lines, and (2) systematic causes: on which action is possible, i.e., draining the holds of cargo vessels, trawlers, liners, lubricant oil, draining on vessels, rinsing and unloading ballast water from tankers. After vessels unload, there actually remains 0.4% of the load in the tanker, formed by residues sticking to the tank walls. For many years, these residues, which tankers must get rid of for reasons of maintenance and security, have been evacuated into the sea by the use of rinsing water. The quality of residues ejected on all seas, and particularly into the Mediterranean Sea and the Atlantic Ocean, may be estimated at some 3 million tons a year. A tank cleaning station should be situated in a region of intense pretrochemical activity and in a tanker repair port. An example is the Marseilles station which is located in the port installations. It has a 90 m long quay with a draught of 10 m where tankers of up to 100,000 tons can be moored. An area of some 25,000 sq meters is available, with a treatment capacity of 12000 t/h. The station offers facilities for cleaning and degasifying tankers, coasters, tank wagons and trucks. The residues, slop, rinsing water, are separated. The hydrocarbon mixture receives treatment to raise its flashpoint. The station is equipped with a permanent separator tank, 2 reception tanks, 1 tank for treatment, 1 extractor, and storage tanks. A MATHEMATICAL MODEL FOR THE WET-AIR OXIDATION OF SLUDGE,
Kyoto Univ. (Japan). Faculty of Engineering.
T. Takamatsu, I. Hashimoto, and S. Sioya.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-32, 8 p, July-August 1970. 7 fig, 1 tab, 5 ref.

Descriptors: *Mathematical models, *Oxidation, *Sludge, *Sludge treatment, Chemical oxygen demand, Sewage treatment, Waste water treatment.
Identifiers: Decomposition.

It has been discovered that the wet-air oxidation of sludge is composed of two phenomena, that is, sludge decomposition without oxygen followed by the oxidation of the decomposed sludge by oxygen, at a temperature of 170 - 250 deg C and a pressure of 60 - 130 kg/sq cm-gauge. A mathematical model of this reaction process is proposed in terms of COD and weight of solid matter, soluble nonevaporative matter and soluble evaporative matter in sludge. The parameters involved in the mathematical model are estimated by a nonlinear estimation technique. Sludge is a highly complex mixture and the complexity of its composition makes it difficult to represent its thermal decomposition and oxidation in a mathematical form. As the mathematical model should be as simple as possible, the sludge content is roughly classified into four categories. They are: (1) solid matter, (2) soluble nonevaporative matter below 120 deg C, (3) soluble evaporative matter above 120 deg C, (4) pure water. Separate mathematical models are derived for the (1) thermal decomposition process, (2) relation between thermal decomposition and oxidation, (3) oxidation process. Experiments carried out by using artificially cultured activated sludge have verified that the model is applicable for the reaction of sewage sludge. Thus, it will become possible to control and design the wet-air oxidation process on a quantitative basis by using the mathematical model proposed here. (Hancuff-Texas)

BIOLOGICAL TREATMENT OF THERMALLY CONDITIONED SLUDGE LIQUORS,
Zimpro, Inc., Rothschild, Wis.
A. H. Erickson, and P. V. Knopp.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-33, 15 p, July-August 1970. 7 fig, 6 tab, 31 ref.

Descriptors: *Filtration, *Biological treatment, *Sludge, *Sludge treatment, Oxidation, Chemical oxygen demand, Mathematical models, Kinetic, Nitrification, Nitrogen, Efficiency, Performance.
Identifiers: Oxygen transfer, Mass balance.

Described are the results of biotreatment of thermally conditioned sludge liquors in their undiluted form with the purpose of: (1) defining the fraction of organic carbon (as CO COD) which is non-biodegradable. (2) determining yield and endogenous decay coefficient, (3) developing parameters for use in full scale design and cost estimating. The liquor for the biotreatments was prepared by processing approximately 2,000 gallons of mixed primary and waste activated sludge from the Stevens Point, Wisconsin sewage treatment plant (primary and activated sludge) through a 5 gallon per minute pilot plant thermal conditioning system. Two types of feed material were used representing two levels of thermal conditioning vis. 5-10% oxidation or low oxidation and 70% wet air oxidation or highoxidation. The feed COD concentration ranged from 7,000 to 12,200 mg/l BOD, nitrogen, phosphorus and pH showed similar variation. BOD5 removals in excess of 90% were accomplished at loading rates as high as 4.0 pounds BOD applied per pound of mixed liquor volatile suspended solids. The sludge solids yielded sludge volume indices in the range of 60-80mg/l suspended solids. Oxygen transfer rates were determined and for the system KL was correlated with superficial air velocity. Undiluted liquors will support growth of nitrifying organisms under loading conditions normally assumed to be required for nitrification oin activated sludge systems, i.e. loading rate less than .32 pounds BOD per pound MLVSS. THE EFFECT ON THE CHEMICAL CONTENT OF SEA WATER WITH A LIMITED EXCHANGE OF WATER FROM A LARGE OCEAN OF POLLUTING DISCHARGES OF CHEMICALS (WITH THE BALTIC SEA AS AN EXAMPLE),
Akademiya Nauk SSSR. Institut Okeanologii.
A. Simonov, and A. Justchak.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper III-12, 3 p, July-August 1970.

Descriptors: *Marine microorganisms, *Marine plants, *Oceans, *Chemical wastes, *Water pollution control, Discharge (Waters), Oils, Ammonia, Biochemical oxygen demand, Phosphorus, Waste water disposal, Industrial wastes.
Identifiers: *Baltic Sea.

The problem of preventing sea water pollution by industrial and domestic discharges is one of con-

siderable importance, since progressive pollution of sea water can result in a sharp deterioration of sanitary conditions and may cause considerable damage to the fishing industry. Discharges of pollutants are particularly dangerous when the receiving waters have low flushing characteristics due to their limited exchange capacity with the major adjacent ocean. The Baltic Sea is a typical example of this case. To date, the systematic investigation into the chemical pollution of the Baltic Sea has been quite limited. Because of this lack of information the Hydrological Service of the USSR decided to make a systematic study of the chemical composition of the waters in the Baltic Sea coastal areas. The data from these investigations includes the following: oil products, phenol, ammonia, organic substances, oxidizability, Biological Oxygen Consumption (BOC5), oxidic medium reaction, oxygen and biogenic substances. Under the influence of domestic and industrial discharges the following conclusions may be drawn: (1) the natural composition of sea water has changed over a period of years, this is reflected by the increase in ammonia, organic phosphorus and oxidizability levels, (2) oxygen deficiency in many coastal waters has been observed. (Hancuff-Texas)
W70-10337

TREATMENT OF PULP MILL EFFLUENTS ON SORPTION RESINS,
D. Ruzickova.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-34, 9 p, July-August 1970. 5 fig, 4 tab, 7 ref.

Descriptors: *Pulp and paper industry, *Effluent, *Sorption, Industrial wastes, Resins, Ion exchange, Testing, Sulfite liquors, Waste water treatment, Efficiency, Equilibrium.

The object of this study was to show the possibility of treating some types of pulp mill effluents by reversible sorption on sorption resins. The idea of utilizing the properties of sorption resins for the treatment of waste waters, polluted with organic, especially biochemically resistant substances, arose from findings in water treatment by demineralization. Anion exchange resins after long use inactivated by the irreversible linkage of some types of high-molecular organic compounds are only partially liberated during recovery. This fact is attributed to the low diffusion velocity of their voluminous organic molecules. For this reason one sometimes precedes ion exchange filters in demineralization plants with suitable sorption resin media, which permit efficient sorption and especially desorption of the high-molecular organic compounds. On the basis of preliminary tests conducted under static and dynamic conditions, it has been found that for the removal of organic pollution from pulp mill effluents (from the production of sulphite pulp) a suitable type is the resin OSTION-SL (L-33). The treatment removes colour-producing and biochemically resistant substances which is of importance for the reuse of treated water in the production process. This resin can be also used for sulphate pulp mill effluents treatment after biological pretreatment as in the case of sulphate pulp mill effluents and bleaching process effluents. (Hancuff-Texas)

SIGNIFICANCE AND LIMITS OF THE BUCHNER-FUNNEL-FILTRATION-TEST (BFFT),
E. Zingler.
Fifth International Conference on Water Pollution Research, San Francisco, July 26-August 1, 1970. Preprint, Paper II-31, 8 p, July-August 1970. 5 fig, 6 ref.

Descriptors: *Filter, *Vacuum drying, *Test procedure, *Limiting factor, *Laboratory tests, Evaluation, Sludge, Sludge treatment, Waste water treatment.
Identifiers: *Buchner funnel, Vacuum filtration.

Assessments of properties and filterability of sewage sludges are gained through laboratory tests. However, it is well known that there is a risk when the lab. testing results are practically applied. This risk must be attributed to: (a) a lack of standard methods, (b) insufficient attention given to factors of technical procedure. In an account of a research project on sludge dewatering the results of Buchner-Funnel-Filtration-Tests (BFFT) are presented for subpressure conditions. Exemplified by the Buchner-Funnel some causes must be pointed out which may lead to divergencies in the results arrived at by various researchers: (a) Considerable divergencies emerge if different filterpapers are used in filtering untreated sludges. (b) So far no attention has been given to the storage capacity of the perforated plates of the Buchner-Funnels. Depending on construction and diameter 2 to 14 cu cm of sludge water are retained in the slotted plates before the filtrate flows into the measuring cylinder. (c) The quality of comparable parameters is decisively codetermined by test arrangement and implementation. (d) A further instability factor for comparable parameters results from the recommendation to build up slowly the required pressure. (Hancuff-Texas)
W70-10339

QUALITY PREDICTIONS IN A POLLUTED ESTUARY,
Clyde River Purification Board, Glasgow (Scotland).
D. W. Mackay, and J. I. Waddington.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper III-7, 6 p, July-August 1970. 4 fig, 4 ref.

Descriptors: *Estuaries, *Water pollution control, *Water quality, Retention, *Sewage disposal, Sewage treatment, Dissolved oxygen, Flows, Tides, Rivers.
Identifiers: Marine disposal.

Methods of measuring the degree of organic pollution in an estuary and predicting the effects of changes in the polluting load are described. A reduction in the load from one source produced a considerable improvement along the length of estuary considered, the extent of which was in accordance with that predicted. A relatively simple approach to the problem of estuary management has produced results useful for dealing with such problems as (1) the acceptability of new polluting discharges, (2) the priorities to be established from improvement of existing discharges, (3) predicting the effects of large scale water abstraction from one of the main feeder rivers and (4) predicting the temperature rises which might be expected from the siting of thermal power stations at various locations. No claim is made that a full understanding of the processes involved has been achieved, for example current work is showing that the relationship between dissolved oxygen and freshwater flow derived during a period of normal rainfall pattern does not hold good under conditions of exceptionally prolonged drought. As the investigation continues with more refined techniques, it should be possible to discard initial assumptions and render this useful and relatively economic approach adequate for the task of aiding the management of a rapidly changing estuary system. (Hancuff-Texas)
W70-10340

STUDIES ON PARAMETERS AFFECTING SLUDGE DEWATERING IN PRESSURE FILTERS,
Emschergenossenschaft, Essen (West Germany).
H. Graefen, and H. J. Donges.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-30, 10 p, July-August 1970. 12 fig, 5 ref.

Descriptors: *Dewatering, *Filters, *Sludge, Pressure, *Sludge treatment, Sewage treatment, Filtration, Design, Efficiencies, Fly ash, Activated sludge, Waste water treatment.
Identifiers: Pressure filters, Filterability.

Pressure filters are more and more used for the dewatering of waste water sludges. In general they enable dewatering to a degree such as to obtain firm and transportable sludge cakes with solid contents of more than 50%. At the same time, the sludge volume is reduced to less than 20% of the initial sludge volume. Due to the high degree of dewatering, the caloric value of these sludge cakes is usually above 1500 kcal/kg so that they will burn on their own without additional fuel. The properties of the sludge, especially its filtrability, form the decisive parameter for the efficiency of the pressure filters. To characterize the properties of the sludge, parameters such as the solids content, the structure and the size distribution of the solids, the index of the activated sludge and the organic matter are generally used. These and possibly other characteristics can sufficiently describe various chemical and physical properties of the sludge. In general, domestic and industrial sewage sludges cannot be dewatered in pressure filters without previous conditioning. This applies especially to activated sludge. Improvements of the filtrability of sludges can be attained by filter aids such as iron chloride, iron sulphate and lime, or by the addition of polymers or solid matter, especially fly ash. Much more effective for improving the filtrability of activated sludge is thermal conditioning. (Hancuff-Texas)
W70-10341

VIRUS REMOVAL BY ADSORPTION IN WASTE WATER TREATMENT PROCESSES,
Maine Univ., Orono. Dept. of Civil Engineering.
Otis J. Sproul, Murray Warner, Leo R. La Rocholle, and Dirk R. Brunner.
Fourth International Conference on Water Pollution Research, Prague, Czech., September 2-6, 1968. Preprint, Paper 13, 7 p.

Descriptors: *Viruses, *Activated carbon, *Adsorption, *Efficiencies, *Phosphates, *Chemical precipitation.
Identifiers: *Virus removal.

Studies on the removal of viruses from waste water by activated carbon adsorption and calcium and aluminum phosphate precipitation are described. Viruses employed in this work were the T2 bacteriophage and Type 1 poliovirus (Sabin). They were suspended in domestic secondary treatment plant (trickling filter and activated sludge) effluent or saline water for all runs. Virus removal by activated carbon adsorption with an initial T2 virus concentration of 1,000,000 plaque forming units (Pfu) per ml resulted in maximum removals of 32, 9, and 7 percent at column hydraulic loadings of 40.8, 122, and 326 l/min/sq m, respectively. It was observed during the poliovirus runs that after 25 l input, virus concentrations in the effluent exceeded those of the influent to the columns indicating a reversible process. Precipitation by calcium phosphate resulted in poliovirus removals exceeding 90%, for an initial phosphate concentration of 85 mg/l and 182 mg/l calcium hydroxide. T2 removals by aluminum phosphate precipitation exceeded 98% and reached 99.9% for various initial phosphate concentrations and alum dosages. It was concluded that virus removal by activated carbon adsorption is not a dependable process but that removals by phosphate precipitation would appear both reliable and a valuable additional benefit in the removal of phosphate. PRESSURE FILTRATION OF SECONDARY TREATMENT PLANT EFFLUENT,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Edward L. Berg, and Carl A. Brunner.
Water and Wastes Engineering, Vol 6, No 10, p 54-58, October 1969. 5 fig, 6 tab.

Descriptors: *Effluents, *Pilot plants, *Filtration, *Costs, *Waste water treatment, *Tertiary treatment, Flocculation, Operating costs.

Identifiers: *Single medium filtration, *Dual media filtration, Anthracite coal, Polyelectrolytes, Alum.

A field study using a commercial pressure filter to clarify secondary treatment plant effluent is described. Two different filter beds were evaluated: a single-medium filter consisting of 20 inches anthracite coal (effective size 0.75 mm) and a dual-media filter consisting of 6 inches sand (effective size 0.45 mm) and 14 inches anthracite coal. Filtration rates were either 5 or 10 gpm/sq ft and filter performance was determined by measurement of filter headloss, influent suspended solids and effluent turbidity. Four different polyelectrolytes were investigated in conjunction with varied alum dosages. Results indicated that cationic polyelectrolytes were more effective in preventing floc break through than were the nonionic or anionic polyelectrolytes. For the single medium filter using dosages of 2.16 mg/l polyelectrolytes and 14.5 mg/l alum at a filtration rate of 10 gpm/sq ft. total organic carbon (TOC) removal was 50% and phosphate removal was 17%. Slightly better TOC removal and significantly less phosphorus removal was observed in the dual media filter under similar conditions. Estimates for a 1 mgd capacity plant indicated a total cost of 6.7 cents per 1000 gallons for this type treatment. (Sorber-Texas)

PILOT PLANT STUDIES OF EFFLUENT RECLAMATION,
Eimco Corp., Salt Lake City, Utah.
J. D. Phillips, and G. L. Shell.
Water and Wastes Engineering, Vol 6, No 11, p 38-41, November 1969. 4 fig, 5 tab, 7 ref.

Descriptors: *Effluent, *Reclamation, *Pilot plants, *Filtration, Coagulation, Activated carbon, Phosphorus, Biochemical oxygen demand, Alkylbenzene sulfonates, Irrigation water, Cooling water, Water reuse.
Identifiers: *Dual-media filtration, Chemical treatment, Suspended solids.

A two-phase study to determine the best processes to be used for reclaiming sewage treatment plant effluent for use as irrigation water and inexpensive cooling tower make-up water is discussed. The first phase dealt with the removal of larger suspended solids to prevent fouling of irrigation sprinklers. A dual-media filter employing anthracite coal and sand was investigated. It was found that an 8 foot deep filter consisting of 50% anthracite was most effective in removing the suspended solids. Results indicated that filter runs of up to 50 hours could be achieved at filtration rates of between 10 and 20 gpm/sq ft. Suspended solids removal varied between 24 and 35%. The second phase involved producing a good quality effluent to be used as cooling tower make—UP WATER. Processes selected were chemical coagulation, dual-media filtration, and activated carbon adsorption. Coagulation with lime at 325 mg/l or alum at 175 mg/l resulted in 74-85% removal of BOD5; 70-80% removal of suspended solids; and 91-95% removal phosphorus. A 50% anthricite 4-ft-deep dual media filter produced further reductions in BOD5, suspended solids and phosphorus of 25%, 60%, and 50%, respectively. Carbon adsorption results in indicated additional removals of 33% for BOD5; 80% for COD; 25% for suspended solids; 50% for phosphorus; and 97% for ABS. (Sorber-Texas)
W70-10344

NUCLEIC ACID AS A COMPONENT OF MUCILAGE IN ACTIVATED SLUDGE,
Kurita Central Labs., Yokohama (Japan).
Shozo Nishikawa, and Mitsuo Kuriyama.
Water Research, Vol 2, No 7, p 811-812, July 1968. 2 tab, 5 ref.

Descriptors: *Activated sludge, *Biochemistry, *Enzymes, Metals.
Identifiers: *Nucleic acid, *Deoxyribonuclic acid (DNA), *Ribonucleic acid (RNA), Composition.

It is reported that high amounts of DNA (deoxyribonucleic acid) and RNA (ribonucleic acid) are contained in mucliage in activated sludge from sewage. The DNA and RNA are folded in the sludge floc and are protected with metal ions. The method of extraction of this DNA and RNA employs EDTA and 95% ethanol with sodium chloride. Fractionation and quantification followed for DNA and RNA of activated sludge and Escherichia coli. From E. coli only 1.8 percent of its RNA and a trace of DNA was extracted while as much as 40 percent of the DNA and RNA in the activated sludge was obtained. It was concluded that from activated sludge, (1) mucliage containing nucleic acid can be obtained without breaking down the living cells by extracting it with EDTA solution; (2) polymerized nucleic acid is folded in the floc as an insoluble form together with protein; (3) this nucleic acid is protected by metal ions; and (4) nucleo-protein released by autolyzis from microbial cells in the activated sludge is accumulated and is prevented from enyzmatic depolymerization. THE DALLAS PHILOSOPHY-AN APPROACH TO WASTE WATER RECLAMATION,
Dallas, Tex.
Henry T. Graeser.
Water and Wastes Engineering, Vol 6, No 9, p 58-61, September 1969.

Descriptors: *Water reuse, *Research facilities, Water quality, Pilot plants, Political aspects, Public health.
Identifiers: *Water hygiene.

The problems, advances and necessity of increased waste water reuse are explored from a philosophical point of view. It is pointed out that waste water reuse is an actuality in many instances today and water requirements for the future make this practice of continuing increasing importance. Figures are quoted indicating that federal funds allocated for research in water hygiene in fiscal year amount to a mere 1 percent of the total for environmental pollution research. An example of what Dallas, Texas is doing or is planning to do at its water Reclamation Research Center and Laboratory is presented. Some of the problems of water reuse including public acceptance, costs, research, and interagency cooperation are explored. (Sorber-Texas)

WASTE WATER TREATMENT: THE TIDE IS TURNING.
Robert W. Holcomb.
Science, Vol 169, No 3944, p 457-459, 31 July 1970.

Descriptors: *Waste water treatment, Pollution abatement, Water pollution control, Sewage treatment, Tertiary treatment, Chemical precipitation, Activated carbon, Electrodialysis, Reverse osmosis, Filtration.
Identifiers: Microscreens.

A general discussion of the current state of sewerage and sewage treatment is presented. Successes in pollution abatement and properties of sewage are mentioned. Primary and secondary sewage treatment systems are described and performance data in terms of solids and Biochemical Oxygen Demand removal are given. New processes and systems of waste treatment are discussed with respect to BOD, solids, nitrogen and phosphorous removal. Comparisons are made between the performance and costs of new and old systems and processes. Specific developments and processes discussed are: the use of pure oxygen in the activated sludge process, the precipitation of phosphate with lime, multimedia filtration, microscreening, carbon adsorption of refractory organic compounds, ion-exchange units, electrodialysis, reverse osmosis. The problem of final sludge disposal is mentioned along with current solutions and desirable developments of the future. The need for a broad-based research and development program to solve existing problems and to explore new areas is elucidated. (Hewett-Rutgers)

SOME ECONOMIC ASPECTS OF WATER REUSE IN CZECHOSLOVAKIA,
International Water Pollution Research Conference (5th).
V. Reinhardt.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-31. 6 p, 2 tab, 12 ref.

Descriptors: *Water utilization, *Water re-use, Recirculated water, Reclaimed water, Water demand.
Identifiers: Effluent charges, Czechoslovakia.

Water re-use is a significant factor in water utilization. For water re-use via water courses, the relation between the treatment costs of discharged waste waters and damage caused by the polluted water is discussed. Statistical data are given showing a relatively high degree of recirculation of water in Czechoslovakian industry. Degree of circulation is a general index of level of water management, but is not a goal per se as there are other important factors to consider. Data are also given showing water use, and unit costs including some data on taxes for releasing untreated waste and municipal sewage charges. Industry has not yet used sewage effluent in Czechoslovakia, but the author outlines situations in which this would be very desirable. (Whipple-Rutgers)

THE APPLICATION OF A LINEAR PROGRAMME MODEL TO WATER CONSERVATION AND EFFLUENT MANAGEMENT AT MODDERFONTEIN FACTORY,
African Explosives and Chemical Industries Ltd., Johannesburg (South Africa); and National Inst. for Water Research, Pretoria (South Africa).
N. A. Lever, A. T. Alexander, R. J. Buttery, B. Moffat, and M. R. Henzen.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-30. 9 p, 2 fig, 3 ref.

Descriptors: *Linear programme, *Water conservation, Management, *Effluents, *Industrial wastes, *Mathematical models, Water supply, Water reuse, Constraints, Stochastic processes, Costs.

The demand for water in South Africa is briefly reviewed together with the need to purify effluents. Modderfontein Factory faces the problem of conserving water while at the same time satisfying tentative standards laid down by the Department of Water Affairs. There are a number of sources of second grade water available which could be used to supplement the limited supply of first grade potable water. A mathematical model is described which enables the effect of the use of various grades of water to be rapidly assessed, using the Company's IBM computer. The programme is run through weekly and the use of an optimum mix has enabled the factory to save 85 million imperial gallons per year of potable water giving rise to a new savings of R12,000 per year. It is concluded that mathematical modeling has wide application under similar conditions. (Hancuff-Texas)

THERMONALYTICAL CONTROL OF THE SLUDGE STABILIZATION PHENOMENA,
Research Inst. for Water Resources Development, Budapest (Hungary).
P. Benedek, P. Farkas, and P. Litherathy.
Fifth International Water Pollution Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper HA-8. 7 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Sludge, *Stabilization, *Digestion, Operations, *Design control, Anaerobic digestion, Biological treatment, Waste water treatment, Sewage treatment, Water pollution control.
Identifiers: *Thermoanalytic method.

The purpose of sludge stabilization is to decrease organic material subject to decomposition, as well as fixed or stored water in different forms, or rather to release the latter with a view to facilitation dewatering. Variation of organic material contents could be followed by measuring volatile solids. However, the former comprises both the weight loss due to Thermal decomposition of inorganics and the effect of evaporation of fixed water in the sludge. Presented is a reliable method for the practicing engineer with which he may follow variations of organic material and fixed water contents of sludge for the design operation and control of biological sludge stabilization systems. The extent of stabilization may be determined reliably with the ignition loss measurement applied in routine laboratories with the modification that first the ignition should be carried out in nitrogen and then the previously obtained carbon residue is ignited in oxygen. The sludge stabilization may be considered to be terminated when with increasing stabilization time the carbon determined by means of the above procedure does not further decrease. (Hancuff-Texas)

AN INTEGRATED BIOLOGICAL-CHEMICAL PROCESS FOR MUNICIPAL WASTE WATER TREATMENT,
California Univ., Berkeley. Sanitary Engineering Research Lab.
M. J. Humenick, and W. J. Kaufman.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-19. 18 p, 4 fig, 6 tab, 24 ref.

Descriptors: *Waste water treatment, *Biological treatment, Chemical precipitation, *Performance, Sewage treatment, Kinetics, Aeration, Activated sludge, Mathematical models, Efficiency, Phosphorus.
Identifiers: *Chemical treatment.

An integrated biological-chemical waste water treatment pilot plant was operated over a period of 8 months at organic loadings appreciably exceeding those normally employed in municipal biological waste treatment systems. The system involved two stages: biological stage followed by a precipitation flocculation stage with inorganic chemical solids recycled to the first stage to achieve continuous control over the separability of the biologically active solids. The results of the investigation are as follows: (1) removals of BOD were at an excess of 90% and COD an excess of 80%, at BOD loadings of 400 to 500 lbs per day per 1000 cubic foot variation. Under these conditions the residence time of the aeration basin may be reduced one hour and good performance may be expected with as little as 20 minutes of variation. Sludge volume indicies of over 100 were achieved at suspended solids concentration in exceeding 9,000 mg/l. Phosphorus removal of at least 95% was demonstrated with both lime and alum additions to the second stages of precipitation flocculation unit. The second stage clarifier was operated as a sluged blanket unit with the overall suspended solids removal generally exceeding 95%. The effluent was generally lower than 20 JTU and less than 10 for extended periods. (Hancuff-Texas)

TECHNIQUE OF EVALUATION OF SYSTEM PARAMETERS RELATING SOLIDS ACCUMULATION IN OXIDATION DITCHES PROCESS,
N. Chandhuri.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-10. 7 p, 5 fig, 3 tab, 13 ref.

Descriptors: *Evaluation, Performance, Kinetics, Mathematical models, Sludge, Waste water treatment, *Sewage treatment, *Biological treatment.
Identifiers: *Oxidation ditch, Solids wasting, Solids accumulation, Suspended solids.

Biologically, the oxidation ditch process is an extended sludge aeration modification of the activated sludge process. Like extended sludge aeration plants, oxidation ditches are without controlled sludge wasting, because it was believed that daily accumulation of sludge solids in the system would be negligible as the period of aeration was extended. Subsequent investigations disproved this belief and demonstrated that non-degradable fractions of microbial mass accumulated in the system. For better operational control of extended aeration plants a method should be evolved to predict accumulation of sludge solids. The paper presents a technique to evaluate system parameters relating to solids accumulation. A study was conducted on an oxidation ditch as a reactor vessel which was operated as a batch feed system using slow feeding a full days loading of nutritionally balanced glucose solution as a substrate. The oxidation ditch was operated at a wide range of volumetric process loadings of 20 to 100 lbs of COD per day per thousand cubic feet ditch volume. The system operated under conditions of no solids wasting showed an accumulation of sludge solids in amount equal to 18% by weight of the COD utilized. (Hancuff-Texas)

NITROGEN-PHOSPHATE RELATIONSHIPS AND REMOVALS OBTAINED BY TREATMENT PROCESSES AT THE HYPERION TREATMENT PLANT,
California State Dept. of Public Works, Los Angeles.
R. D. Bargman, J. M. Betz, and W. F. Garber.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-14. 17 p, 7 fig, 5 tab, 13 ref.

Descriptors: *Nitrogen, *Phosphorus, *Sewage treatment, *Nitrification, *Chemical precipitation, Nutrients, Waste water treatment, Efficiencies, Operations, Metals.
Identifiers: *Hyperion.

The Hyperion treatment plant of the City of Los Angeles received an average waste water flow of 340 MGD during 1969. In this daily flow were approximately 86,000 lbs of phosphate, 51,000 lbs of ammonia, and 102,000 lbs of organic nitrogen. Because phosphate removal as well as overall affluent quality requirements are becoming more severe, the secondary treatment design parameters may well have to be considered in terms of findings of this report. A removal of 95% of the soluble phosphate from the flow of about 50 MGD over a six month period was observed after minor process modification was made. The secondary effluent phosphate as phosphorus had been decreased from about 19 mg/l to less than 0.5, wasting the waste activated sludge directly to the sludge treatment facilities with the digested sludge resulted in this increased phosphate removal. To examine this phenomenon a little more fully a series of laboratory tests were made using two-meter beakers. The results showed that as air rates increase from 4.7 to 18.5 cubic foot per gallon quicker precipitation of the phosphate was observed in addition to swifter nitrification and a rapid rise of the pH to about 7.6 followed by a steady increase to about 7.9 in 7 to 9 hours. HYDRAULIC FIELD TESTS ON A SETTLING BASIN,
Research Inst. for Water Resources Development, Budapest (Hungary).
L. Muszkalay.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-18. 6 p, 5 fig, 3 ref.

Descriptors: *Settling basin, *Hydraulics, Testing, Statistics, *Retention, Design, Efficiency, Time, Distribution, Statistic processes, *Settling basins.

The hydraulic behavior of settling basins equipped with a row of weirs as a distribution system has been determined for the time of residence, based on observed discharges. The function is analogous to the flow-thru hydrograph determined by the continuous ploting of a tracer material. Mathematically and physically defined hydraulic deficiencies, the standard deviation of time of residence and distribution of flow velocities can be determined with the help of this function. Below the design discharge of 50LPS hydraulic efficiencies were found to deteriorate rapidly, owing mainly to the non-uniform design of the weirs. In the range of 40 to 75 LPS the design range hydraulic efficiencies were found to remain fairly constant accompanied by small scatter of the lines of residence. Within the design range the basin is capable of accommodating changes in discharge. Conditions of settling are rather low. Efficiency can be raised by improving the weirs. (Hancuff-Texas)

OBSERVATION OF THE VIRUS BINDING CAPACITY OF SLUDGE,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark).
E. Lund.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-24. 5 p, 2 tab, 5 ref.

Descriptors: *Viruses, *Sludge, *Digestion, Activated sludge, Sewage treatment, Waste water treatment, Microorganisms, Isolation.
Identifiers: *Binding capacity.

The virus binding and inactivating capacity of activated sludge treatment is reported to have been studied in experiments where a known quantity of virus has been added to sludge samples in a pilot plant system or in a sewage plant. Such experiments have also been carried out in order to get an estimate from a quantitative point of view and have furnished much useful information. Artifically virus contaminated systems and the methods applied to recover virus from these may not be relevant however in connection with the naturally occurring viruses. These may be present in the sewage in a different way. A number of observations regarding the virus binding capacity in sludge are made. A comparison is made between virus isolation from sludge samples and influent and effluent swab samples. The effluents samples contained, when virus is demonstrated, the same types of Coxsackie B strains as the effluents. But ECHO strains are demonstrated more frequently in the effluent than in the raw sewage influent. The Adenovirus strains were found only in the influent samples. When comparing the recovery of virus from samples by means of 2 hours against 24 hour absorption periods there was no higher percentage of virus positive cell cultures. A fractionation of sewage samples by means of centrifugation is also discussed. (Hancuff-Texas)

THE FULL-SCALE RECLAMATION OF PURIFIED SEWAGE EFFLUENT FOR THE AUGMENTATION OF THE DOMESTIC SUPPLIES OF THE CITY OF WINDHOEK,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. Van Vuuren, M. R. Henzen, G. J. Stander, and A. J. Clayton.
Fifth International Water Pollution Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-32. 9 p, 5 fig, 4 tab, 8 ref.

Descriptors: *Sewage treatment, *Waste water treatment, *Tertiary treatment, *Water reuse, *Water quality, Water supply, Algae, Activated carbon, Adsorption, Filtration, Chlorination, Chemical precipitation, Flocculation, Flotation.
Identifiers: Windhoek, South Africa.

In early September 1968, a critical situation in water supply and demand developed which necessitated the expeditous conditioning of a full-scale water renovation plant. The reclaimable sewage effluent is derived from a conventional sewage treatment plant comprised of primary sedimentation by filtration, secondary sedimentation followed by further biological purification in 9 maturation ponds in series. Total hydraulic retention time is 14 days. The reclamation plant constitutes an integral part of the existing water treatment works and is comprised of recarbonation, algae flotation, foam fractionation, chemical flocculation, break point chlorination, clarification, sand filtration and activated carbon. The reclaimed water after carbon absorption is mixed with purified raw water and the clear water supply. The add mixed strains are then post-chlorinated to a free residual of 0.2 ppm and then pumped to the city's service reservoirs. The total cost for the production of reclaimed water including fixed capitol, chemical and running costs, amount to 11.9 cu pm, while the average costs for purified dam water are 10.7 cu pm. The cost figure for carbon treatment is based on a single use of the carbon medium without regeneration resulting in a high cost. If regeneration facilities are provided it is estimated that the total cost for reclaimed water will be 9.53 cu pm. (Hancuff-Texas)

CONTRIBUTION TO THE PROBLEM OF BIOFLOCCULATION IN THE ACTIVATED SLUDGE PROCESS,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschultz, Zurich (Switzerland).
G. Peter, and K. Wuhrmann.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-1. 9 p, 5 fig, 1 tab, 9 ref.

Descriptors: *Sewage treatment, *Activated sludge, *Flocculation, Waste water treatment, Microbiology, Microorganisms, Colloids, Stablization, Particle size.
Identifiers: *Bioflocculation, Polyelectroytes, Destabilization.

Investigations with 16 bacterial strains, isolated from activated sludge, revealed that the phenomena involved in the process of flocculation can be best understood under the assumption of bacterial cells representing protected dispersoids. Stability of aqueous suspensions of bacteria is therefore not or not essentially a function of double layer repulsion. Bridging by chain (DEAE, Dextran, Sulfate) or particulate (Bentonite) polymers is the predominant mechanism for the flocc formation in bacterial suspensions, and has already been proposed by earlier authors. Various factors presumably interfering with the absorption of polymeric flocculation agents on the cell surfaces were studied (Type and growth phase of organisms, pH, electrolyte concentration, partical size, type of polymer, etc.). There is evidence that humic acid polymers are as effective as flocculation agents in activated sludge. It is assumed that in practical plant operations the formation and polymerization of humic acids may represent determining parameters for the clarification of the effluents. (Hancuff-Texas)

AN ENZYMATIC TECHNIQUE TO DETECT SURPLUS PHOSPHORUS UPTAKE BY ACTIVATED SLUDGE,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
E. G. Fruh, W. E. Morgan, H. G. Moore, Jr., R. B. Higgins, and M. L. Shahan.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-2. 14 p, 12 fig, 6 tab, 14 ref.

Descriptors: *Phosphorus, *Enzymes, *Activated sludge, Measurements, Test procedures, Waste water treatment, *Sewage treatment, Metabolism, Kinetics, Chemical precipitation, Sorption.

An alkaline phosphatase bioassay technique procedure is evaluated for use in detecting surplus phosphorus uptake by activated sludge cultures. This evaluation is based on both batch and continuous flow bench scale units. All of the experiments conducted indicated a general relationship existing between alkaline phosphatase activity and surplus phosphorus. High enzymatic activities and low cellular phosphate are associated with low influent phosphorus concentrations; low enzymatic activities and high cellular phosphorus are associated with intermediate and high influent phosphorus concentration. However, no quantitive relationship was found during the experiments relating enzymatic activities to cellular phosphorus. The long term continuous unit indicated a biological selection process was always present. Bacteria with phosphorus requirements suited to the influent phosphorus concentration predominated. This normal continuous selection process in mixed bacterial cultures increases the difficulties encountered in evaluating metabolic relationships and perhaps may have masked any quantitative result that could or did exist in these experiments. These experiments did not indicate a practical quantitative relationship between alkalinity and phosphotase and cellular phosphorus for evaluating surplus uptake of phosphorus for mixed bacterial cultures, i.e. activated sludge. EFFECT OF FOREIGN COMPONENTS ON THE PRECIPITATION OF PHOSPHATE BY ALUMINUM,
Rutgers - The State Univ., New Brunswick, N.J.
Wen Lin Yuan, and Pa Ho Hsu.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-16. 12 p, 8 tab, 13 ref.

Descriptors: *Chemical precipitation, *Phosphate, *Aluminum, Effects, Fluoride, Kaolinite, Montmorillonite, Waste water treatment, *Coagulation.
Identifiers: Polymers.

Aluminum salts can be used as coagulants to precipitate phosphates from waste water. This report presents evidence indicating that many other components such as sulphate montmorillite and kaolinite can react with hydroxyaluminum polymer in a similar manner as phosphate ion. In the presence of sulphate precipitation is greatly improved in all samples of p/Al ration equal to 0.3 or below. Thus aluminum dosage can be less critically controlled. In the presence of fluoride the effective phosphate precipitation is achieved only when the amount of fluoride equals the residual positive charge on the hydroxyaluminum polymers. Phosphate precipitation is also proved in the presence of montmorillonite in samples of p/Al more ratio equal 0.3 or below, but considerable amounts of phosphate remain in the solution in most samples. pH of phosphate precipitation varies with the nature and concentration of formed components present. Consequently pH adjustment is not a reliable criterion for controlling phosphate precipitation. The worst effects indicated by foreign components are attributed to two mechanisms of opposing effects: (1) foreign components tend to neutralize the residual positive charge on the polymers and thus precipate both phosphate and aluminum together and (2) these components can compete against phosphate in reacting with hydroxyaluminum polymers thereby reducing the effect of the phosphate precipitation. (Hancuff-Texas)

MICROBIOLOGICAL ASPECTS OF SEWAGE TREATMENT,
Institut Pasteur, Paris (France).
H. Leclerc, A. Perchet, C. Savage, S. Andrieu, and R. Nguematcha.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-23. 8 p, 6 tab, 7 ref.

Descriptors: *Microbiology, *Microorganisms, *Sewage treatment, Waste water treatment, *Pathenogenic bacteria, Salmonella, Mycobacterium, Yeasts.
Identifiers: Parasites, Saprophytic organisms, Hydromycetes.

Up to the present the dangers involved in the handling of numerous microbial pathogenic species, has not seemed to be of great concern to those responsible for treatment of sewage. This study assesses the importance of the risk of infection by defining different kinds of organisms obtained in sewage and by studying their fate during the treatment most commonly applied to liquid sewage or sewage sludges. The samples studied were taken from 18 biological sewage works distributed throughout the whole area of French territory. An impressive variety of pathogenic microorganisms were found to be present in sewage. As a rule these organisms are climinated and concentrated in the sludge. This is true in the case of Salmonella, and for most parasites and fungi. On the other hand Mycobacteria as a whole are found with equal frequency in sewage effluent and in the sludge. Anaerobic digestion, although eliminating between 90 and 99.9% of the total number of entero-bacteria, allow the Salmonella to survive in 75% of the cases; anaerobic digestion must be followed by natural drying in open air before they disappear entirely. Recommendations are presented as to microbiological testing as well as the microorganisms which should be investigated during an inspection. (Hancuff-Texas)

WATER RE-USE IN THE RUHR VALLEY WITH PARTICULAR REFERENCE TO 1959 DROUGHT PERIOD,
Ruhrverband, Essen (West Germany).
H. W. Koenig, G. Rincke, and K. R. Imhoff.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-4. 8 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Water re-use, *Water supply, *Water quality, Standards, *Domestic water, Tertiary treatment, Waste water treatment, Water treatment, Groundwater recharge, Droughts, Runoff, Rainfall.
Identifiers: Ruhr Valley (Germany), Bigge Reservoir, Lippe River, Ruhr River.

Two million people live in the Ruhr catchment in which considerable industrilization has developed. Prior to discharge waste water is mechanically and biologically treated. Four river impoundments provide for tertiary treatment. In summer, river flow is augmented by reservoir discharge. Water works abstracted the mixed river water and obtain drinking water by groundwater recharge. The system described insures a water in adequate quanties and acceptable drinking quality is available at all times to the 5 million inhabitants and various industries. In 1929, the reuse of 300% was experienced without detrimental effects. In December 1959 hard detergents and ammonia could not be sufficiently decomposed at 86% reuse. In October of 1959 65% reuse still gave acceptable conditions. These figures were related to a water consumption of 150 meters per capata per day. After completion of the Bigge Reservoir the reuse factor would not exceed a maximum of 22%, if a recurrence of the 1959 drought were to occur. No difficulties have resulted from this reuse. (Hancuff-Texas)
W70-10386

THE SEASONAL ACCUMULATION OF SOLIDS IN PERCOLATING FILTERS AND ATTEMPTED CONTROL AT LOW FREQUENCY DOSING,
Aston Univ., Birmingham (England).
H. A. Hawkes, and M. R. N. Shepherd.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-11, 8 p, 5 fig, 1 tab, 10 ref.

Descriptors: *Trickling filter, Control, Seasonal, *Dosing frequency, Sewer treatment, Waste water treatment, Ecology, Efficiency, Films.
Identifiers: *Suspended solids, *Solids accumulation.

In trickling filters treating domestic sewage a regular accumulation of solids occurred each winter, this accumulation being greater the colder the winter. Below 10 deg a few degrees difference in the average winter bed temperature results in considerable differences in theamount of solids present. The subsequent unloading of the filter is greatly accelerated by the active raising of the macro-inter-bed fauna at times of rising temperature. A test with low frequency dosing limited the winter accumulation of solids in the surface layer of the filter and also reduced significantly the population of fly larva, thus reducing the potential fly nuisance. The optimum frequency for any filter is determined by the hydraulic conditions of retention time and by the need to maintain the desirable ecological balance. (Hancuff-Texas)
W70-10387

NITRIFICATION IN TREATMENT PLANTS AND NAUTRAL WATERS: SOME IMPLICATIONS OF THE THEORETICAL MODELS,
Water Pollution Research Lab., Stevenage (England).
A. L. Downing, and G. Knowles.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-8. 8 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Nitrification, *Sewage treatment, *Amonia, *Activated sludge, Nitrate, Kinetics, Nitrite, *Mathematical models, Waste water treatment, Temperature, Dissolved oxygen, Rivers, Estuaries.
Identifiers: Natural waters, Nitrobactor, Nitrosimonas.

With increasing expenditures being devoted to pollution control in many counties it is important that the self-purification process governing the fate of ammonia in natural waters be throughly understood. Examination of the influences of nitrification, in particular natural waters, to determine which of the possible kinetic models best represent the real situation. If the basic concept of the theory put forward to account for the behavior of nitrifying activated sludge plants is that the population of nitrifying bacteria in the sludge will alter according to the difference between the rate of growth of nitrifying organisms in the parts of the plant in which the concentration of dissolved oxygen is adequate and their rate of removal as a result of withdrawl of surplus sludge and loss of sludge particles in the effluent. These two rates are related to the operation conditions. In a river, it is implied that a partically nitrified effluent will have a more severe effect on the oxygen resources than if no nitrification were achieved. Different interpretations of kinetics of nitrification in a relation to estuaries can conveniently be examined in terms of simple steady state model which the estuary is assumed to consist of a series of uniformly mixed segments. If the bacterial growth kinetics govern the situation the oxygen resources of the system may be more severely taxed by a process of nitrification in partially nitrified sewage influents or discharge. (Hancuff-Texas)
W70-10388

THE USE OF PLASTIC MATERIAL AS A MEDIUM FOR TRICKLING FILTERS TREATING DOMESTIC SEWAGE,
L. Audoin, J. P. Barabe, G. Brebion, and B. Huriet.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-16. 10 p, 10 fig, 1 tab, 7 ref.

Descriptors: *Trickling filters, *Sewage treatment, *Plastics, Materials, *Domestic wastes, Waste water treatment, Depth, Hydraulics, Efficiencies, Organic loading, Pilot plants, Biochemical oxygen demand.

The removal of organic load in two units of 3 pilot trickling filters filled with 'Cloisonyle' tubes was studied at different rates with either identical cross sections and different depths or identical volume and depths. The performance was as high as 9 kilograms of BOD removed per cubic meter of filter per day without recirculation. Experiments have shown that for settled sewage depth beyond 3 meters has practically no effect on performance and removal efficiency of the organic load. This conclusion is based on studies with constant organic loads and with constant superficial hydraulic loadings. It concluded that large removal of organic loads can be obtained with low pumping costs (100 to 150 watt hours per kilogram of BOD removed), since the high efficiencies indicated up to 9 kilograms BOD per meter cube per day did not require recirculation of the effluent. This removal of 9 kilograms BOD pcm corresponds to a maximum applied load of 20 kilograms of BOD pcm/per day. The superficial hydraulic loading utilized in this study varied from 0.54 to 5 cubic meters per square meter per hour. (Hancuff-Texas)

B.O.D. REMOVAL AND NITRIFICATION OF ANAEROBIC EFFLUENT BY ACTIVATED SLUDGE,
Technion - Israel Inst. of Tech., Haifa.
A. Melamed, C. Saliternik, and A. M. Wacks.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-18. 8 p, 6 fig, 11 ref.

Descriptors: *Nitrification, *Anaerobic conditions, *Activated sludge, *Denitrification, Kinetics, Mathematical models, Oxidation, Nitrite, Biological treatment, *Biochemical oxygen demand.

Due to the increasing significance of nitrogen remval in waste treatment, research was carried out on nitrification and denitrification as a powerful tool for nitrogen removal. It is suggested that the effluent nitrified in the aerobic unit may be recycled through the anaerobic one, thereby achieving the removal of nitrogen. In this report performance of the aerobic part of the system, namely the activated sludge process, was investigated. Kinetics of BOD removal and of nitrification were studied independently. A model (Michaelis Menten equation) based on enzyme kinetics and mixed cultures is used. For BOD the removal rate was 1.5/days. The half removal rate constant was 21 mg/l giving correlation coefficient of 0.92. For nitrification, that is ammonia to nitrate and nitrite to nitrate, the respective values were 2.49/days and 0.37 mg/l ammonia as nitrogen and 0.25 mg/l nitrite as nitrogen. The respective correlation coefficients were 0.87 and 0.91. (Hancuff-Texas)

HIGH QUALITY REUSE WATER FROM A NEWLY DEVELOPED CHEMICAL-PHYSICAL TREATMENT PROCESS,
New York Univ., Bronx.
A. H. Molof, and M. M. Zuckerman.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-21. 21 p, 10 fig, 9 tab, 34 ref.

Descriptors: *Water reuse, Waste water treatment, *Activated carbon, *Filtration, *Chemical precipitation, Sewage treatment, Water quality, Absorption, Phosphate, Pilot plant.
Identifiers: Chemical-physical treatment, Z-M process, Water renovation.

A pilot plant study is made of a chemical-physical treatment process. The raw waste water is mixed with 8% calcium hydroxide slury to obtain a pH of 11.5. Mixing is provided by a propeller mixer and there is retention time of about one minute. A solid separator for flocculation and clarification maintains a surface loading of 560 GPD/sq ft. Sludges are moved continuously at a rate of 0.7 GPM. The liquid then passed to a hydraulic reaction chamber which has a detention time of about 80 minutes. From there the hydrolized waste water is passed into a neutralization tank for 7 minutes where 93% sulphuric acid is added and a pH of 7 maintained. The water is pumped to a sand filter operated at 3.2 GPM/sq ft and then to 5 downflow activated carbon absorber columns of 2 foot depth at a loading of 2.2 GPM/sq ft. Disinfection is obtained through ozonation. From this study it can be seen the process can produce 97% COD removal and greater than 95% phosphate removal. Total costs are about 19.5 cents per thousand gallons. (Hancuff-Texas)

MARINE WASTE DISPOSAL AT RIO DE JANEIRO--WATER QUALITY EVALUATIONS AND DESIGN,
Engineering-Science Inc., Arcadia, Calif.
E. C. Peixoto, C. A. Volpi, and J. Scherfig.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper HA-10. 8 p, 2 fig, 5 ref.

Descriptors: *Waste water disposal, *Evaluation, *Sewage treatment, Estuaries, Water quality, *Design, Waste water treatment, *Flotation.
Identifiers: Marine disposal, *Flotables, *Air flotation, Rio de Janeiro (Brazil).

The optimum design of an ocean disposal system is that combination of treatment and offshore dilution which meets the required receiving water quality criteria at the lowest overall cost for the life of the system. The most important factors which determine the optimum design are: (1) characteristics and treatment of the sewage, (2) oceanographic characteristics of the disposal site, (3) cost of treatment, (4) cost of outfall operation. Preliminary studies for the city of Rio de Janeiro indicated that significant reductions in overall cost of sewage disposal could be expected if effective flotables removal process, without separate sludge handling, could be incorporated in the system. A dissolved air flotation pilot plant was constructed and a total of seventeen tests were conducted under various operating conditions. The influent to the dissolved air flotation unit was degritted, screened and had undergone primary settling. The two independent variables evaluated in these tests were overflow rate in the air flotation tanks which varied between 2,000 GSFD and 6,000 GSFD and the amount of dissolved air released from the total influent to the air rotation tank. Little or no reduction in the concentration of the flotables occurred in these tests when the concentration of the influent was less than 0.80 mg/l. No significant variation in flotables removal with overflow rate in the flotation tank was observed. The amount of air released effected flotables removal significantly 0 to 3.4 m released air per liter showed significantly lower removal than 5.6 to 37.2 ml per liter. Effluent flotables concentration below 1 mg/l can be considered excellent and in higher effluent concentration may be satisfactory. (Hancuff-Texas)

RESPIROMETRIC DETERMINATION OF BOD,
Government Industrial Development Lab., Sapporo (Japan).
T. Nakata, and Y. Kumagai.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-22. 8 p, 5 fig, 1 ref.

Descriptors: *Biochemical oxygen demand, *Respiration, Instrumentation, *Oxygen demand, Aerobic bacteria, Measurements, *Microorganisms, Mathematical models.

The construction and efficiency of a respirometer and the results of some experiments concerning the microorganisms are presented. The apparatus consists of a reaction chamber as master controller, a measuring unit and a recorder. The reaction chamber includes a culture flask with a magnetic stirrer inside and a small vessel for carbon dioxide absorbant, a manometer for sending a pressure signal to a relay circuit and an electrolytic oxygen

generator with a copper sulphate electrolyte. When dissolved oxygen in a sample is consumed by microorganisms the same amount of carbon dioxide as that of the oxygen consumed is evolved by the respiratory action of the microorganism. The absorption of the carbon dioxide by the absorbant causes a decrease of pressure in the closed reaction system and the change of level of dilute sulphuric acid in the manometer closed the relay circuit. The oxygen generator produces oxygen which is fed to the reaction system at a constant rate until the initial pressure is restored. The amount of consumed oxygen is hence proportional to the intregral electroysis time. This method is known to be convenient to speedy measurements. Using glucose the BOD can be determined within 10 to 15 hours. At 20 deg if the measurement is taken at a higher temperature the result can be obtained in a few hours. (Hancuff-Texas)

MODULATION OF THE OXYGEN SUPPLY IN AN ACTIVATED SLUDGE PROCESS,
Degremont S. A., Malmaison (France).
J. Bernard, and R. Louboutin.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper II-6. 8 p, 9 fig 3 ref.

Descriptors: *Oxygenation, *Activated sludge, Irritation, Sewage treatment, Waste water treatment, Biological treatment, Efficiencies, Performance.
Identifiers: *Modulation, Blowers, Surface aerators.

Oxygen supply systems should be designed to take into account the following facts: (1) variation of the liquid level in the aeration tanks, (2) variation of the number of tanks in use, (3) variation in time, temporarily or permanently, of the nominal headloss of the air diffusion devices, (4) variation in the pressure conditions and ambient air temperature, (5) variation in number of air-generating units in use. The influence of these various parameters differ according to the sources of oxygenation employed. The positive displacement air blowers, centrifugal blowers, and mechanical surface aerators are discussed, with this in mind. The ability to vary rotary blowers to modulated rotary blowers by the use of multispeed motors make-up air compressors and continuous speed variation, is discussed. The modulation of centrifugal air blowers is discussed from the standpoint of insertion of local headlosses, modification of the inlet aerodynamic conditions of the blowers, electrical motor speed control, and adjusting both speed and inlet conditions of the blower. Modulation of surface aerators is also discussed. (Hancuff-Texas)

QUANTITY AND QUALITY RELATIONSHIPS FOR COMBINED SEWER OBERFLOWS,
San Francisco, Calif., and Engineering-Science, Inc., Oakland, Calif.
A. O. Friedland, T. G. Shea, and H. F. Ludwig.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-1. 16 p, 5 fig, 5 tab, 2 ref.

Descriptors: Monitering, *Flow, *Hydrology, *Mathematical models, *Hydrograph, *Storm runoff, Storage, Waste water treatment, Water pollution, Water quality.
Identifiers: Combined sewage.

The results of a one year program of wet and dry weather monitoring of five combined sewer systems and one storm sewer system in San Francisco, is presented. The time concentration profiles of combined sewage constituents follow a definite three-phase variation initially having characteristics of raw sewage increasing in the second phase to 125 to 200% of the characteristics of raw sewage, and receding in the third phase to levels of 10 to 25% of the characteristics of raw sewage. No correlation was found between the mass emission of constituents due to storm and the antecedent dry period, land use character, or rainfall intensity. Storm runoff emission equations for COD total suspended solids total nitrogen, ortho-phosphate phosphrous. Hexane extractable material and floatables can be used in conjuntion with dry weather flow, waste load cooefficient, a rainfall history, basin acreage and population to estimate waste water loads. Weather diversions contain twice the total nitrogen and ortho-phosphate phosphrous, 50 to 60% more total nitrogen and COD, 20% more floatables, and 10% more total suspended solids than the storm runoff fraction of the diversion alone would contain. The nitrogen and phosphrous emissions from secondary forms are significantly greater than emissions of these constituents from combined or storm sewage flows on an annual basis. (Hncuff-Texas)
W70-10395

BIOLOGICAL MONITORING OF THE EFFLUENT FROM A LARGE CHEMICAL WORKS IN A RIVER WHICH HAS SOURCES OF POLLUTION UPSTREAM,
Canadian Industries Ltd., Montreal (Quebec).
N. E. Cooke, R. M. Cooper, and T. W. Beak.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-28. 6 p, 2 fig, 4 ref.

Descriptors: *Monitoring, *Water pollution control, Rivers, Mathematical models, Probability, Statistics, Waste water treatment, Testing, Sampling.
Identifiers: *Biological monitoring, *Chemical pollution.

In order to protect themselves and reassure the control authority some forward looking chemical companies are undertaking biological monitoring before and after plant start-up. The effluent was to be discharged into the St. Clair river, where there was already considerable pollution. To complicate the development of the system to monitor the effluent from the new plant the existing pollution in the river was of a random nature indicating that there were intermittent discharges, or spills of pollutants from the industries situated upstream. Mathematically, the problem was to find a statistical method which would enable the company to separate the effects of its plant effluents from the random effects of other effluents coming down from upstream. The invertebrate fauna found on the bottom consisted almost entirely of Chironomidae Pelecypoda, Gaftropoda, and Oligiochaeta. Due to the presence of pollution the more sensitive organisms had already been eliminated. A series of charts were developed which would indicate the differences between the averages from upstream and downstream locations in each biological survey. This permits one to detect a significant change caused by material discharged through the outfall in spite of very large fluctuations in the number of animals caused by random discharges of polluting materials released upstream. (Hancuff-Texas)

PRECIPITATION OF PHOSPHATES FROM WATER AND WASTE WATER USING LANTANUM SALTS,
North American Rockwell Corp., Canoga Park, Calif. Atomics International Div.
H. L. Recht, M. Ghassemi, and E. V. Kleber.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-17. 12 p, 9 fig, 1 tab, 9 ref.

Descriptors: *Chemical precipitation, *Waste water treatment, *Water treatment, *Phosphates, *Tertiary treatment, Sewage treatment, Hydrogen, Ion concentration, Efficiencies, Soluability.
Identifiers: *Lanthanum, *Chemical treatment, Secondary treatment.

Lanthanum salts were investigated for precipitation of phosphates from water. Tests were made using pure solutions of ortho- and condensed phosphates and on secondary effluent. The results compared to results from similar tests using aluminum salts. With Lanthanum (III) residual phosphate in all cases tested was considerably lower over a much broader pH range than with Aluminum (III). La (III) unlike Al (III) was effective at natural waste water pH levels of 7 to 8. At a constant pH of 7, orthophosphate removal was directly proportional to quantity of added La (III), and their use for the treatment of waste water on a wide scale will not be limited by any supply shortage. Because the lanthanide salt will be expensive compared to aluminum or to alum, even with widescale application, their use in the treatment of waste water will probably require provisions for the recovery and re-use. (Hancuff-Texas)

EXTENT OF POLLUTION BY STORMWATER OVERFLOWS AND MEASURES FOR ITS CONTROL,
Ministry of Construction, Tokyo (Japan).
K. Inaba.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper HA-8. 7 p, 4 fig, 1 ref.

Descriptors: *Water pollution, *Storm runoff, *Sewage, *Hydrology, *Hydrographs, Ponds waste water treatment, Mathematical model, Sewerage control, Water pollution control.
Identifiers: *Combined sewage.

A study of the quantity and quality of storm sewage from a combined sewerage system in Tokyo metropolis, was conducted in the period 1966-1967. Three interconnected aspects of the study are discussed: (1) the hourly variation of storm sewage and storm water quantity and quality in urban areas, (2) some considerations on the method of estimating these factors, (3) the control of storm sewage flow and quality. It is important to estimate the hourly variation of storm sewage or storm water quality as a function of rains at all intensities so that accurate measures can be taken for control based on a sound mathematical model. The several possibilities are investigated and it is concluded that in a combined system it was most economical and reasonable to divide the total pollution in storm sewage between the outfall sewer to the treatment works, a storage tank and storm sewage outflows. (Hancuff-Texas)

DEMINERALIZATION OF WASTE WATER BY ION EXCHANGE,
Los Angeles County Sanitation District, Calif.; and Federal Water Pollution Control Administration, Cincinnati, Ohio.
J. D. Parkhurst, C. Chen, C. W. Carry, and A. N. Masse.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-20. 15 p, 8 fig, 7 tab.

Descriptors: *Demineralization, *Waste water treatment, *Ion exchange, Performance, *Tertiary treatment, *Costs, Pilot plants, Efficiencies, Water supply, California.
Identifiers: Advanced waste treatment, *Regeneration, Total dissolved solids, Pomona (Calif.).

An ion exchange pilot plant was successfully demineralized waste water at Pomona, California, for almost three years. Cost estimates for the ion exchange process shows that blended water with 1/3 the influent total dissolved solids removed can be produced at a cost competitive with alternative sources of water in southern California. The system

consists of a two stage ion exchange process which reduces the influent TDS by 90%. After 500 cycles of operation no discernable decrease in efficiency of the unit has occurred. Activated carbon absorption regeneration levels are 1.1 lbs of sulphuric acid per cubic foot for the cation resin and 0.56 lbs of aqueous ammonia for the anion resin. These have produced regeneration efficiencies of 85 to 90% respectively. Brines total approximately 11% of the influent flow and backwash wastes total about 4%, but these can be recycled through the pretreatment system. Estimated costs including carbon pretreatment to produce a blended water of 667 mg/l TDS from an influent stream of 1,000 mg/l TDS is about 23 cents per thousand gallons. (Hancuff-Texas)

METHOD FOR MEASURING AEROBIC DECOMPOSITION ACTIVITY OF ACTIVATED SLUDGE IN AN OPEN SYSTEM,
Research Inst. for Water Resources Development, Budapest (Hungary).
Peter Farkas.
Fourth International Conference on Water Pollution Research, Prague, Czech., September 2-6, 1968. Preprint, Sec, II, Paper 1. 9 p, 6 fig, 1 tab, 15 ref.

Descriptors: *Activated sludge, *Kinetics, *Oxygen demand, Aerobic treatment, Measurement, Respiration.
Identifiers: *Aerobic decomposition, Sludge activity.

Methods of sludge activity measurement are of great significance, since the activity indicates the concentration of living bacteria in the sludge, and its physiological conditions. The best index for sludge activity would be the substrate removal rate itself, if it were possible to measure it in a direct and simple way. An activity measurement procedure was elaborated relying upon the measurement of changes in the steady-state DO concentration of continuously aerated sludge samples. For decomposition activity measurement only substrates supplying oxygen deficiency curves with a sharp breakdown at their total removal may be used, since only in the case of such substances can the decomposition time be determined exactly. Decomposition activity shows linear proportionality to the bacterial concentration of the sludge. Acetate was added to sludge samples in concentrations ranging from 50 to 200 mg/l in order to obtain decomposition times ranging from 80 to 300 min; acetate being in excess above a concentration of 50-100 mg/l, the measured activities depended mainly on the sludge concentrations. The activity vs. substrate concentration functions were found to be different for the non-toxic acetate and the toxic compound, phenol. In the case of acetate, above a concentration of about 100 mg/l, activity was nearly independent of the value of acetate supply. With phenol, the activity vs. substrate function showed a maximum value at 20 mg/l, higher concentrations exerting a toxic effect and thus reducing activity. (Aguirre-Texas)

WATER POLLUTION AND THE TEXTILE INDUSTRY,
W. J. Cosgrove.
Canadian Textile Journal, Vol 87, No 1, 1970, p 63-66. 1 tab.

Descriptors: *St. Lawrence River, Biochemical oxygen demand, Hydrogen ion concentration, Algae, *Entrophication, Neutralization, Sedimentation, Trickling filters, Waste water treatment.
Identifiers: *Textile mill wastes, Montreal, Balancing tanks.

There was a dramatic reduction in the incidence of typhoid fever due to improvements in water supplies in the years 1906 to 1923, at which time the importance of typhoid carriers was discovered. The City of Montreal now faces problems of sewage disposal and the formation of algal blooms in near by rivers and lakes. The textile industry is one of several sources of wastes which adds to the problem. The BOD's and pH's of typical textile wastes are tabulated. About three quarters of the textile plants discharge their wastes to sewers and the remainder to rivers. Treatments used for textile wastes depend upon balancing tanks, neutralization, sedimentation, trickling filters and the use of specific operations and chemical treatments dectated by the particular processing operations and chemicals involved. HOLLOW FIBER PERMEATORS IN INDUSTRIAL WASTES STREAM SEPARATIONS,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
W. P. Cooke.
Desalination, Vol 7, No 1, 1969, 31-46, 13 fig, 3 tab, 2 ref.

Descriptors: *Waste water treatment, Osmosis, *Water reuse, *Membrane processes, Membranes.
Identifiers: Pulp mill wastes, Sugar refinery wastes, Whey, Nylon fibers.

Hollow nylon fibers having diameters of about 45-50 microns are useful as the basis of water permeation equipment. The basic principles involved are well known and calculations of through put is easily made. Performance depends upon area, pressure, temperature, the permeability coefficient of the membrane for water, the osmotic pressure across the membrane and the thickness of the wall of the tubular fibers. It is considered that this type of installation may have useful applications in the purification of waste waters which pose problems when emptied directly into streams. Examples given are for whey processing, pulp mill wastes and sugar refinery wastes. (Work-North Carolina State)

TEXTILE EFFLUENTS AND THEIR SAFE DISPOSAL,
N. A. P. Perera.
Silk and Rayon Industries of India Vol 12, No 11, 1969, 555-574, 7 diag, 6 tab, 41 ref.

Descriptors: Cotton, Acids, Suspended load, Heavy metals, *Waste disposal, *Waste water disposal, Waste water treatment.
Identifiers: *Textile mill wastes, *Dyehouse wastes, Man-made fibers, Desizing, Kier scouring, Bleaching, Mercerizing, Dyeing, Silk, Silk degumming, Wool, Wool scouring, Wool grease, Jute, Rayon, Nylon, Acrylic fibers, Cellulose acetate fibers.

Polluting materials from the processing of textiles are (1) acids and alkalis, (2) organic matter, (3) toxic materials, especially compounds of heavy metals such as lead, copper chromium and the like, (4) suspended solids, (5) oils and greases, and (6) dyes and other colorants. Treating methods are (1) physical such as screening and settling, (2) chemical such as neutralizing or other chemical reactions and floculation and precipitation and (3) biological. These several treating methods are discussed and examples of operatins are illustrated with diagrams and flow charts. The processing if described of cotton fabrics by desizing, kier boiling, bleaching, mercerizing and dyeing with the waste products to be expected. Silk degumming and bleaching are discussed. Scouring of raw wool and recovery of wool grease, the retting of flax and the scouring and dyeing of jute are covered. The behavior of detergents, new developments in this field and the disposal of these materials in waste waters are presented. The manufacture of cuprammonium rayon the dyeing of this and also viscose rayon, the manufacture of cellulose acetate fibers, nylon fibers, acrylic fiber, are touched upon from the standpoint of process chemicals and the disposal of wastes. Laundry wastes and their handling are discussed. Examples of the recovery of useful products such as potassium salts and grease from wool scouring, arsenates and phosphates and alizarin dye from other process are described. (Work-North Carolina State)

TREATMENT OF WASTE FROM POLYESTER MANUFACTURING OPERATIONS,
Fiber Industries, Inc., Charlotte, N.C.; and Davis and Floyd Engineers, Inc., Greenwood, S.C.
C. E. Steinmetz, and W. J. Day.
Chamical Engineering Progress, Symposium Series Vol 65, No 97, 1969. p 188-190.

Descriptors: *Water reuse, *Reclaimed water, Organic compounds, Chemical wastes, Ion exchange, Biochemical oxygen demand, Chemical oxygen demand, Color, Activated sludge, Algae, Waste water treatment.
Identifiers: *Polyester fibers, Man-made fibers, Methyl alcohol, Ethylene glycol, Polymers, Dimethyl terephthalate.

This is a progress report to May 1969, on a water reuse project, jointly undertaken by the Shelby Plant of Fiber Industries, and the FWPCA. This plant applies a lubricant, or so-called 'fiber finish', to the polyester fiber manufactured there. It is of a proprietary nature but for purposes of waste treatment schemes may be considered a long chain fatty acid or derivative thereof. This material, blow down water from the power plant, and small amounts of chemical wastes, including methyl alcohol, ethylene glycol, dimethyl terephthalate, low molecular weight polymer and titanium dioxide, ion exchange recharge chemicals, housekeeping and laboratory wastes are the essential waste products. In a pilot plant study the waste water previously treated in an extended aeration activated sludge system is further treated. As received it has a color of 50 units, C.O.D. of 280-300 ppm and B.O.D. of 8-24 ppm. Algae are removed by screening and a carbon unit reduces the color to 10 units, C.O.D. to 125 ppm and B.O.D. to 4 ppm. One half of this water is discharged and the rest returned to the system after cooling and removal of chromium and zinc salts. (Work-North Carolina State)
W70-10433

TREATMENT OF WASTES FROM COTTON TEXTILE INDUSTRY,
V. Rama Rao.
Technology, Special Issue 3, Vol 4, p 56-58, 1966.

Descriptors: *Cotton, Pretreatment (Water), *Coagulation, Lime, Gypsum, Settling basins, *Filtration, Filters, Separation techniques, Waste water treatment.
Identifiers: Bleaching, *Dyehouse wastes, Fibrous solids, Suspended solids.

The volume of waste water discharged from 87 cotton textile mills at Ahmedabad (India) varies between 10,000 and 3,000,000 gallons per day. Waste waters are chiefly from bleaching and dyehouse operations and contain fibrous and suspended solids. Owing to great variations in the characteristics of the waste water, it is not appropriate to mix it directly with sewage and to treat them in a combined treatment plant. The modified pretreatment methods of waste treatment in each plant were worked out, which consists of coagulation by lime and gypsum followed by sedimentation and filtration through a gypsum filter. (Livengood-North Carolina State)

WASTE DISPOSAL BY TEXTILE PLANTS,
Chatham Mfg. Co., Elkin, N.C.
Arthur L. Smith.
Water Pollution Control Federation Journal, Vol 37, No 11, p 1607-1613, November 1965. 3 fig, 3 tab.

Descriptors: *Biochemical oxygen demand, Acidity, Alkalinity, Suspended load, Dissolved solids,

Color, Foaming, Toxicity, Scum, Water pollution, Equalizing reservoirs, Flow control, Temperature control, Anaerobic digestion, Waste storage, Aeration, Hydrogen ion concentration, *Waste disposal, Waste water treatment.
Identifiers: *Textile wastes, Antibacterial finishes, *Dyehouse wastes.

The biochemical oxygen demand, acidity or alkalinity, suspended solids, dissolved solids, color, foam, toxicity, and bacteriostatic materials are the major water pollutents from textile operations. Solids may be removed by mechanical, physical-chemical, or semibiological methods. Secondary treatment may include pH adjustment, chemical or time equalization, flow or temperature control, anaerobic lagooning, and aeration. The current trend in textile waste treatment is toward the aeration technique. Treatment operations at plants of the Chatham Manufacturing Company and J. P. Stevens Company are discussed. Biochemical oxygen demand, scum, and dissolved oxygen content problems are emphasized. (Lonon-North Carolina State)
W70-10435

PLANT FOR TREATMENT OF EFFLUENTS.
Ames Crosta Mills and Co., Heywood (England).

Textile Manufacturer, Vol 89, No 1057, p 34, January, 1963.

Descriptors: *Waste water treatment, Screens, Solid wastes, *Pulp wastes, Neutralization, Settling basins, Chemical precipitation, Flocculation, Biological treatment, Activated sludge, Biochemical oxygen demand, Sludge, Trickling filters.
Identifiers: *Textile mill wastes, Balancing tanks.

In designing a waste treatment plant, it must first be decided whether treatment could be reduced within the mill itself. However, this decision is limited in textile operations, as textile wastes are derived from necessary removal of material from the product. Screening removes large solids and fibrous matter. Neutralization should precede settlement. Further chemical treatment, precipitation and flocculation, if needed, must be followed by settlement. Biological treatment, using trickling filters or activated sludge, is often necessary to remove excessive biochemical oxygen demand and must be followed by settlement. Chemical wastage and increased sludge production, which often occur because of inadequate treatment, justify careful consideration of a suitable treatment plant. Balancing tanks should be considered. (Work-North Carolina State)

5E. Ultimate Disposal of Wastes

DISPOSAL OF BRINE BY SOLAR EVAPORATION: DESIGN CRITERIA,
New Mexico State Univ., Las Cruces.
C. G. Keyes, Jr., W. S. Gregory, N. N. Gunaji, and J. V. Lunsford.
For sale by Supt. of Documents, U S Government Printing Office, Wash., D C 20402 - Price $1.25 per copy. Office of Saline Water Research and Development Progress Report No 564, May 1970. 123 p, 15 tab, 30 fig, 52 ref, 5 append. OSW Contract No 14-01-0001-969.

Descriptors: *Brine disposal, Evaporation, Energy balance, *Mathematical models, *Computer models, Solar radiation, Heat balance, Heat budget, Waste water disposal, Brines, Water temperature, New Mexico, Desalination plants.
Identifiers: *Evaporation rates, Brine evaporation, Design criteria, Solar ponds, Evaporation basins, Roswell (New Mexico).

Design criteria for disposal of brine by solar evaporation was investigated. A heat transfer model and a diffusion model were used as the main components of the criteria. Model studies showed that the use of a small depth resulted in higher brine temperatures. A 2-inch depth gives an average difference of six degrees centigrade throughout the year for conditions at the Roswell, New Mexico ponds. The heat transfer model was also useful in predicting the surface temperature of deeper basins. A wind directional analysis was used to acquire insight into the proper orientation for the influent disposal basin. The results of this analysis indicated that a Roswell basin should be constructed with its longitudinal axis on an azimuth of 165 degrees. POTABLE WATER WITH BULRUSHES: NEW STRATEGY AGAINST WASTE WATER PROBLEMS.
Northeastern Wisconsin Regional Planning Commission, Appleton; and Scientific Translation Service, Ann Arbor, Mich.

Trans. from German (Medical Tribune). n. d. 6 p. Supported by a HUD grant.

Descriptors: *Potable water, *Bulrush, *Water pollution treatment, *Waste water (Pollution), Phenols, Industries, Nutrients, Metabolism, Organic matter, Toxins, Biochemistry, Assay, Tracers, Self-purification, Water treatment, Coliforms, Enteric bacteria, Salmonella, Eggs, Water quality.
Identifiers: Metal salts, Rhine (Germany), Central Africa, Scirpus lacustris, Heterotrophism, Lindau (Germany), Phytoncides, Polycyclic phenolcarboxylic acid.

The Lindau Public Works Department on the Rhine instigated extensive test series with phenol concentrations of varying degrees under different conditions based on information that bulrushes (Scirpus lacustris) remove metal salts as well as phenols from waste water. They proved that bulrushes not only thrive in phenol-containing water but showed improved growth at higher phenol concentrations; S lacustris evidently utilized phenol extracted from the water as a nutrient or agent for synthesis. Only at an extreme phenol concentration of 900 to 1000 milligrams/liter did the bulrushes exhibit inhibited growth or mortality. Using quantitative and qualitative biochemical assays and tracer techniques biochemists confirmed that the bulrush can use the toxins as building blocks for its protein, for example, synthesize aspartic acid or alanine from waste water phenol. The bactericidal action of the bulrush is attributed to a phytoncide, one fraction of which has already been enriched; evidently this is the acid fraction of the plant, apparently a polycyclic phenolcarboxylic acid. Large-scale projects based on this principle would mean degradation of city wastes by a growth of bulrushes along meandering waterways as a third treatment stage. (Jones-Wisconsin)

5G. Water Quality Control

JOINT CONFERENCE ON PREVENTION AND CONTROL OF OIL SPILLS.
American Petroleum Inst., New York; and Federal Water Pollution Control Administration, Washington, D.C.

Available from NTIS as PB-194 395, $3.00 in paper copy, $0.65 in microfiche. Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Institute, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Institute, New York, 1970. 345 p. FWPCA Project 15080 EIL---12/69.

Descriptors: *Oily water, *Water pollution sources, *Water pollution treatment, *Water pollution control, Monitoring, Surfactants, Water analysis, Biodegradation, Path of pollutants, Ecology, Data storage and retrieval, Data collections.
Identifiers: Oil spills.

On December 15-17, 1969, a Joint Conference on Prevention and Control of Oil Spills was held under the cosponsorship of the American Petroleum Institute and the Federal Water Pollution Control Administration. The objectives of the conference were to delineate the overall dimensions of the oil spills problem, explore the present state of the art of prevention and control of oil spills, and review the relevant research and development efforts of government and private industry, both here and abroad. The topics discussed include spill prevention, boom design, mechanical removal, chemical additives, analysis and sampling, monitoring, beach cleanup, fate of spills, ecological effects, and oil-spill information retrieval and dissemination. UNITED KINGDOM MINISTRY OF TECHNOLOGY WORK ON OIL POLLUTION,
Warren Spring Lab., Stevenage (England).
J. Wardley Smith.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 27-40, 1970. 14 p, 3 fig, 4 tab.

Descriptors: *Water pollution sources, *Water pollution treatment, *Water pollution control, Oily water, Oil industry, Ships, Oil wells, Oil-water interfaces, Oil wastes, Beaches.
Identifiers: Oil spills, United Kingdom.

The work of the research laboratories of the United Kingdom Ministry of Technology in the field of oil pollution is described. It includes the removal of oil from beaches and from the sea, the burning of oil in tanks, and the use of booms in sheltered waters. In 1960, there were a number of fairly large-scale oil pollution incidents off the south coast of England. Treatment of oil on beaches, methods of dealing with oil on the sea, the burning of oil in tanks, the use of booms to protect particular sites, and other means of preventing oil from reaching the surface of the sea are described. Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 129-136, 1970. 8 p, 10 fig, 1 tab, 1 ref.

Descriptors: *Water pollution control, *Water pollution treatment, *Oily water, Rivers, New York, Aeration, Water pollution sources.
Identifiers: Buffalo River (N Y).

Two main systems were developed to control oil pollution on the Buffalo River, N.Y.: the upper river system uses surface oil booms and the lower river system uses an underwater air barrier. The basic design of the air barrier is discussed, along with the results of laboratory and field testing. The sampling and analysis phase of oil retrieval and the use of surface chemical displacing compounds are summarized. (See also W70-10035). (Knapp-USGS)

E. J. Struzeski, Jr., and R. T. Dewling.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 217-222, 1970. 6 p, 2 tab, 19 ref.

Descriptors: *Water pollution control, *Water pollution treatment, *Oily water, Surfactants, Absorption, Burning.
Identifiers: Oil spills, Oil spill treatment.

Chemical treatment methods have been used at all recent major oil spills with varying degrees of success. Technical information is presented on the applicability and effectiveness of the various chemicals and materials presently available for preventing and for controlling oil spills. Special emphasis is given to techniques designed to absorb and gel oils floating on the water surface, to sink oils, and to permit burning of the oil mass upon open waters and affected shorelines. The impact, consequences and damages of small and large oil spills are briefly mentioned. (See also W70-10035). (Knapp-USGS)

STUDY OF EQUIPMENT AND METHODS FOR REMOVING OIL FROM HARBOR WATERS,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Lab.; and Bureau of Commercial Fisheries, Ketchikan, Alaska.
P. C. Walkup, L. M. Polentz, J. D. Smith, and P. L. Peterson.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 237-248, 1970. 12 p, 1 fig, 6 tab, 5 ref.

Descriptors: *Water pollution control, *Water pollution treatment, *Oily water, *Cost analysis, Equipment, Cost-benefit analysis, Surfactants, Decision making.
Identifiers: Oil spills.

A cost effectiveness analysis was performed for equipment, materials, and techniques for the removal of spilled petroleum products from the surface of port and harbor waters used by U.S. Naval craft. Effectiveness criteria, formulated for present methods and presently available equipment and materials, included speed of application, completeness of removal, ease of operation, effect on marine life, operating continuity, and availability. Parameters for the effectiveness study were based on the petroleum products now in use or those planned for future use and a detailed review of the geographic, hydrographic, physical, and environmental characteristics of ports used by the U.S. Navy. The two most cost-effective systems for broad application were found to be mechanical recovery of spilled material by surface suction devices, supplemented by mechanical containment, and the application of chemical dispersants by pier- or vessel-mounted high pressure spray equipment. W70-10040

CONFINEMENT AND CONTROL OF OIL POLLUTION ON WATER WITH MONOMOLECULAR SURFACE FILMS,
Naval Research Lab., Washington, D.C. Chemical Oceanography Branch.
William D. Garrett.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 257-261, 1970. 5 p, 8 fig, 1 tab, 7 ref.

Descriptors: *Oily water, *Water pollution control, *Monomolecular films, *Surfactants, Water pollution treatment, Octadecanol.
Identifiers: Oil spill treatment.

Under favorable conditions monomolecular surface films can be used to guide, confine and condense petroleum spills on water. Composed of water-insoluable, non-toxic organic material, these films spread rapidly and spontaneously into a one-molecule-thick layer. Consequently, small quantities of film material will clear thin oil layers from large areas of a water surface. The effects of wind, the chemical character of the pollution and its thickness upon the usefulness of the film is discussed. In addition to clearing water surfaces of oil, one of the most useful applications may be the ability of the surface film to confine and condense a small oil spill into layers as thick as one centimeter. Since the petroleum is thickened and compressed into a much reduced surface area, the efficiency of oil retrieval techniques would be enhanced. (See also W70-10035). (Knapp-USGS)

NEW METHODS FOR COMBATTING OIL SLICKS,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (Netherlands).
F. H. Meijs, L. J. Schmit Jongbloed, and H. J. Tadema.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 263-269, 1970. 7 p, 13 fig.

Descriptors: *Oily water, *Water pollution control, *Water pollution treatment, Absorption, Surfactants, Burning, Equipment, Ships.
Identifiers: Oil spill treatment.

A new device was developed to clean spilled oil from water. It incorporates the principle of continuous operation by means of a floating and circulating absorbent belt. The apparatus operates satisfactorily under practical conditions on inland waters. Oil slicks at sea can be sunk by means of sand that has been rendered oil-wet by the addition of special wetting agents. This can be accomplished in one fast operation by using a sea-going hopper dredger which first gathers the sand from the sea bottom and stores it still wet in its hoppers. At the site of the oil slick, after fluidization of the sand with water and addition of a small amount of chemical, the sand/water slurry is sprayed over the floating oil. This method was shown to have practical potential by large-scale tests with a dredger. Both from an economic and an operational point of view, this seems to be the only potentially viable way of attacking really large oil spills on the sea. (See also W70-10035). (Knapp-USGS)

POLLUTION CONTROL AT A MAJOR OIL SPILL,
Union Oil Company of California, Los Angeles. Dept. of Air and Water Conservation.
T. H. Gaines.
Proceedings of Joint Conference on Prevention and Control of Oil Spills, American Petroleum Inst, and Federal Water Pollution Control Admin, Dec 15-17, 1969, New York, NY; published by American Petroleum Inst, New York, p 271-280, 1970. 10 p, 2 tab, 4 append.

Descriptors: *Oily water, *California, *Water pollution treatment, Oil industry, Water pollution control, Surfactants, Burning, Oil fields, Oil wells.
Identifiers: *Oil spills, *Santa Barbara Channel (Calif), Oil spill treatment.

The eruption of crude oil from the ocean floor five and one-half miles offshore from Santa Barbara, California on January 28, 1969, created a substantial task of pollution control and property cleanup. In spite of all difficulties encountered, the beaches, harbors, houses, boats and shoreline have been restored, and in some cases, exceed their original beauty and cleanliness. The cleanup has been costly and time-consuming. More than $4,500,000 has been spent in the prevention of pollution and restoration of property and the environment. (See also W70-10035). (Knapp-USGS)

Identifiers: Oil spills.

Experiments on oil containment by mechanical barriers led to identification of the important physical phenomena controlling the extent of an oil slick and illustrate flow conditions leading to failure of the barrier. A mathematical model has been developed to generalize the experimental results. Three regions in the oil layer are identified. A gravity wave region near the upstream end of the slick, which leads to oil droplet formation if water flows faster than a certain critical speed; a boundary layer region where drag of the flowing water causes gradual thickening of the oil; and a skirt region where the flowing water causes oil droplets still present to be swept under the barrier. Failure is also possible when oil can escape under the boom by a kind of draining action. Example calculations and design charts are presented to be used in deciding whether stationary mechanical barriers would work at all in given cases, and in selecting the proper depth of skirt and length of boom required in those cases where mechanical barriers are feasible. Where stationary barriers are not feasible, the results can be used to establish minimum boom drift velocity to prevent oil from escaping. (See also W70-10035). (Knapp-USGS)

Identifiers: Water resources management.

Water quality must be considered in the development and planning aspects of water resource management. To accomplish this, the decision-maker needs to have at his disposal a systematized procedure for simulating water quality changes in both time and space. The simulation model should be capable of representing changes in several parameters of water quality as they are influenced by natural and human factors impinging on the hydrologic system. A water quality simulation model was developed in conjunction with a hydrologic simulation model. The model represents water quality changes in both time and space in response to changing atmospheric and hydrologic conditions and time-varying waste discharges at various points in the system. This model has been developed from and verified with actual field data from a prototype system. Procedural guidelines are given to assist in the development of water quality simulation models as tools for use in the quality-quantity management of a hydrologic unit. (Knapp-USGS)

Descriptors: Economics, *Mathematical models, Path of pollutants, *Waste assimilative capacity, *Water quality, *Water pollution control, *Biochemical oxygen demand, Computers, Dissolved oxygen, *Quality standards, Rivers, Sewage treatment, Simulation, Streams.

A comprehensive study is reported of water pollution control and stream water quality as they relate to the establishment of stream and effluent standards. The ability of Iowa streams to assimilate organic wastes was determined on a state-wide basis, with three hydrologic-water quality regions being identified: Ideal, Good, and Poor. Quantitative values were assigned for low flow discharges in each region. The preliminary results indicate that the BOD loading in the streams must be limited to 10 - 15 mg/l to maintain the established dissolved oxygen standard of 4 mg/l. The physical characteristics of effluents from typical waste treatment processes were determined and related to mathematical models for BOD progression. A more refined BOD model was developed. A case study of the Skunk River at Ames revealed the nature of the response of an Iowa stream to discharge of effluents from a water pollution control plant. A digital computer model was developed for simulating, verifying and forecasting stream water quality. The results indicate three major factors influence stream quality: oxidation of the carbonaceous organic wastes contained in effluents, nitrification of nitrogenous compounds, and the effect of nutrient levels in causing a substantial algal response. The economic value of water pollution control was evaluated for the City of Ames. Present annual expenditures will double or triple in the future depending on the desired level of stream water quality. (See also W70-06094)

Descriptors: *Reservoir storage, *Reservoirs, *Impoundments, Intakes, *Water quality, Submerged weirs, Effects, Thermal stratification, *Water quality control, Stratification, Withdrawal, Outlets, Aeration, Pumping, Tailrace, Turbines, Dissolved oxygen, Reservoir operation, Reaeration.
Identifiers: Effect, Multilevel outlets, Diffused air pumping system, Selective level releases, *Destratification (Thermal).

Correcting adverse effects of thermal stratification and low dissolved oxygen content in large reservoirs, and controlling physical, chemical, and biological parameters of released water from impoundments in the southeastern United States are described. Results of water quality investigations at the Clark Hill and Hartwell Reservoirs are outlined along with predictions of quality expected at West Point Reservoir. Comparisons are made of various possible corrective solutions investigated such as: (1) multilevel penstock intakes, (2) submerged weirs, (3) tailrace and turbine aeration, and (4) destratification systems. Emphasis is placed on a diffused air pumping system prototype equipment test at Allatoona Reservoir in northern Georgia. The destratification equipment and types and methods of sampling and data processing are described. (USBR)

CONTROL OF AQUATIC PLANT NUISANCES (ESPECIALLY ALGAE) WITH SOME SUBSTITUTED PHENYLUREAS,
Ivonne J. Le Cosquino de Bussy.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 539-545, 1969. 1 fig, 4 tab, 9 ref.

Descriptors: *Aquatic plants, *Nuisance algae, *Algicides, *Phenols, *Water quality control, Crustaceans, Rotifers, Swimming pools, Chlamydomonas, Daphnia, Diatoms, Chlorella, Scenedesmus, Oxygen, Coliforms, Sediments, Mud, Sands, Sludge, Recreation.
Identifiers: *Phenylureas, Diuron, Flagellates, Monuron, Transparency, Cyclops, Scenedesmus obliquus, Dactylococcus, Escherichia coli, Oocystis, Lemna, Spirodela, Elodea.

The requirement in the Netherlands for a good means of controlling algae nuisance in open-air flow-through swimming pools or in recreational ponds, fostered research with substituted phenylureas. These herbicides are inhibitors of photosynthesis. Higher submerged water plants and filamentous algae can be controlled very well by the application of diuron in early April in dosages varying from 0.2 to 0.4 ppm. In order to control microalgae in swimming pools and to obtain a transparency of 100-250 centimeters a higher dose is necessary, the growth of Crustacea, which eat small algae being desirable at the same time. The addition of diuron should be effected in clear water preferably with an initial dose of one ppm. In smaller swimming pools the concentration of diuron must be above 0.6 ppm in order to obtain a transparency of 120-240 centimeters. In large swimming pools (6000 cubic meters) a transparency from 170-270 centimeters could be maintained even during the time when the diuron in the water was no longer detectable. (Jones-Wisconsin)

PHYSICAL AND MATHEMATICAL MODEL STUDIES OF SURFACE CURRENTS,
Hydraulics Research Station, Wallingford (England).
I. W. M. Moir, and J. M. Willians.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint 6 p, Fig. 2.

Descriptors: *Estuaries, *Physical models, *Mathematical models, Winds, Currents, Correlation analysis, Model studies.
Identifiers: *Surface currents, Graphical presentation.

Physical and mathematical models based on field observations have been developed for analysis of wind and tide effects on surface water currents. Investigation into sea disposal have been conducted on the Tyne and Tees estuaries and Firth of Forth. A six month program of field work was undertaken for each of the investigations. Current observations were obtained, by direct reading and recording instruments at five depths, over a tidal cycle at a number of locations. The movement of surface water was tracked by drogues. The current measurements and associated wind observations from each investigation were analyzed for correlation between wind and wind-induced currents, and for information on basic current drift in the absence of wind. A graphical method of presentation of the data is also shown in this paper. Results showed a high significance level for the basic regression equation, but low correlation coefficients, indicating considerable scatter. Further work is therefore needed to identify systematic components in the error vectors. (Upadhyaya-Vanderbilt)

MATHEMATICAL MODEL TECHNIQUES FOR COASTAL WATERS,
Edinburgh Corp. (Scotland).
D. Haverson.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, 5 p.

Descriptors: *Mathematical models, Potential flow, *Wind, *Currents, Tidal effects, Frequency.
Identifiers: *Coastal waters, Least squares fit, Tidal cycle.

The subject of the model is the structure of the flow patterns in the layer of water 1.5 meters below the surface of the region under investigation. Purpose of the model is to predict the track of a drogue centered in this layer, for any conditions of wind and tide. The main data consists of sets of wind/current readings, the latter at a depth of 1.5 meters, at half-hourly intervals. A relation between wind and wind-enduced current in the area is derived. Two methods are combined in the construction of the model, one based on potential theory and in the other, the tidal period is subdivided, and at each point of sub-division two surfaces are found which are best least-squares fits to the resolutions East and North of current magnitude. This is done by Fourier analysis. Two methods can be combined by applying Green's formula to the boundary data, and then adding the information gained in this way to the data already available for the least-square fit. Enough work has been done to provide strong evidence for the viability of the method. The programs are written in Fortran IV for an I.C.L. system 4-50. (Upadhyaya-Vanderbilt)

THE FLOW OF ROUND BUOYANT JETS ISSUING VERTICALLY INTO AMBIENT FLUID FLOWING IN A HORIZONTAL DIRECTION,
Waterloopkundig Laboratorium, Delft (Netherlands).
G. Abraham.
Fifth International Water Pollution Research Conference, San Francisco, July 26-Aug 1, 1970. Preprint, 7 p, 3 fig.

Descriptors: *Jets, *Velocity, Thermal pollution, Momentum equations.
Identifiers: *Buoyant jet, Entrainment, Drag coefficient, Drag force, Cross-flow.

Hot stack gases discharged into a cold cross-wind and jets of sewage issuing into an ocean-current are two examples of the phenomenon of a round buoyant jet into a cross-flow. In the present analysis a modification of Loh-Nien Fan's description of the entrainment is given. Describing the entrainment of round buoyant jets in a crossflow distinction must be made between a subdomain with predominant influence of buoyancy. Making this distinction the problem can be solved theoretically on basis of two separate coefficients of entrainment to express the entrainment in both subdomains and on basis of one drag coefficient to describe the drag force per unit length of jet, FD. The coefficient of entrainment for jets primarily influenced by initial momentum is taken as 0.057 and for thermals moving through stagnant ambient fluid, 0.5. The drag coefficient CD is taken as 0.3. Theoretical solutions obtained along this method were found to agree with experiments. (Upadhyaya-Vanderbilt)

MODELING SPREAD OF HEATED WATER OVER LAKE,
Minnesota Univ., Minneapolis. Dept. of Civil Engineering and Hydraulics.
Heinz Stefan.
Journal of the Power Division, Proceedings ASCE, Vol 96, No PO3, Proc Paper 7375, June 1970, p 469-482. 1 fig, 1 tab, 10 ref.

Descriptors: *Thermal pollution, *Cooling water, *Thermal powerplants, Environmental engineering, Hydraulic models, Lakes, Nuclear powerplants, Outlets, Reservoirs, Temperature, Water quality, Dispersion.

Physical modeling must include three significant phenomena, mixing at the outlet, stratification, and surface heat transfer. Flow and cooling of a warm water surface layer can be represented in a model if, first, flow of water in and out of the model, and, secondly, atmospheric conditions above the model are controllable. Because the cooling process follows an exponential law, 'all' may signify 95 percent to 99 percent. Using the dimensionless equations of motion, continuity and heat transfer, similarity criteria for the flow of heated water over an essentially stagnant and colder impoundment are presented. Turbulent flow in the model, matching of reduced gravitational forces and surface heat loss as well as sufficient size of the model are considered to be most essential modeling requirement. (Upadhyaya-Vanderbilt)

HYPERBOLIC COOLING TOWERS, DEVELOPMENT AND PRACTICE,
Rogers-Cohen-Barreto-Marchertas, Inc., Chicago, Ill.
Paul Rogers, and Eli W. Cohen.
Journal of the Power Division, Proceedings of ASCE, PO1, Proc Paper 7030, Jan 1970, p 117-128. 18 fig, 10 ref.

Descriptors: *Thermal pollution, *Cooling towers, *Winds, Pressure, Dead loads, Foundation.
Identifiers: *Hyperbolic cooling towers, Plexiglass model, Shells, Diagonal columns.

Mathematical studies leading to membrane analysis are briefly described. The total design of a hyperbolic cooling tower involves more than the shell analysis. It includes the other major steps such as the foundations, the diagonal columns, the lintel, and the top stiffening girder. Numerous tests and measurements indicate that positive pressure exists only on a relatively small portion of the tower at the windward side. Starting at about 40 deg azimuth, the rest of the shell is under negative pressure with maximum values at about 70 deg azimuth. Smooth surfaces are subject to substantially increased negative pressures. Tests indicate that there is virtually a uniform negative pressure within the tower with an approximate value of one-half of the wind force. Aerodynamical instability should be avoided. The model tests provided information concerning the distribution of wind forces, the meridian membrane and flexural forces, the parallel membrane and flexural forces. While earthquake design is not included herein, it is recommended that the provisions of the Structural Engineer's Association of California be employed with particular emphasis to ductility and dynamic response. It is concluded that the theoretical and practical development of hyperbolic cooling towers has reached a high plateau of efficiency. (Upadhyaya-Vanderbilt)
W70-10213

SALT-WATER COOLING TOWERS QUESTIONED.

Electrical World, June 1, 1970, p 46-47. 1 fig.

Descriptors: *Cooling towers, *Saline water, *Thermal pollution.
Identifiers: Material selection, Drift.

Several areas of technical concern with salt-water towers were reported. In addition to more obvious problems of material selection, marine growth in towers, vapor-plume dispersion, and hurricane-wind design, it was noted that the presence of salt in the cooling water acts to depress vapor pressure. This retards evaporation and causes a small increase in cooling-tower size for equal performance. Because salt is damaging both to metals and to vegetation, considerable effort was spent in trying to understand the mechanism by which it is transported and deposited. Towers now available, however, are said to limit drift to a maximum of 0.2% of tower-circulated water. Using this upper limit, and with designed circulation - water requirements at the ultimate 2,384-Mw Turkey Point rating, salt could be released to the atmosphere at up to 66,600 lb. per hour. Based on 7000 hr. per year of operation, this could accumulate to 466 million lb. per year. Fouling and corrosion of electrical switch gear and control equipment would cause serious operating and maintenance problems for the operating utility. (Upadhyaya-Vanderbilt)

TASK I REPORT: SURVEY OF LARGE-SCALE HEAT REJECTION EQUIPMENT,
Dynatech R/D Co., Cambridge, Mass. Thermal Engineering Group.
John H. Carey, John T. Ganley, and John S. Maulbetsch.
Federal Water Quality Administration, Water Pollution Control Research Series, July 1969. 127 p, 31 fig, 8 tab, 86 ref. FWQA Project 16130 DHS---7/69, Contract 14-12-477.

Descriptors: *Thermal power plants, *Cooling towers, Heat, Condensers, *Thermal pollution.
Identifiers: Cooling ponds, *Heat rejection equipment.

Various types of heat transfer equipment which would be applicable to the task of dissipating condenser discharge heat from large power plants are identified. Their performance is analyzed, performance prediction methods are presented, and

the capital and operating costs are given. A brief review was made of the basic thermodynamics of the Rankine power cycle in order to provide some basis for understanding the effect of the heat rejection process on the total cycle. Information including sizing procedures, capital and operating costs, duty maintenance requirements, and possible secondary pollution considerations are presented for candidate systems such as once-through cooling (to serve as a base), cooling ponds, spray ponds, wet cooling towers, dry cooling towers, evaporation condensers, and air-cooled condensers. Operational considerations are discussed including the theory of operation at the design point, off-design performance, running procedures, and any unusual characteristics affecting the interface between the cooling system and the power plant. The material describing each of the individual units is integrated and procedures and criteria are developed for the selection of an optimum unit given a particular geographic location, capacity requirements, and economic constraints. Dynatech R/D Co., Cambridge, Mass. Thermal Engineering Group.
Ware D. Fuller, and John S. Maulbetsch.
Federal Water Quality Administration, Water Pollution Control Research Series, August 1970. 94 p, 30 fig, 15 tab, 139 ref. FWQA Project 16130 DHS--8/70, Contract 14-12-477.

Descriptors: *Electric power production, *Thermal power plants, *Nuclear power plants, Heated water, Fuels, Operating cost, Maintenance costs, Heat exchangers, Temperature, *Thermal pollution.
Identifiers: Broiler plant, Steam turbines, Steam condensers, Fixed charge rate.

This report is part of a larger study to perform a technical and economic survey of alternate methods for cooling condenser discharge water from thermal power plants. The task reported on in this document investigates the criteria by which the power plants themselves are designed and optimized. These criteria are both technological and economic. The initial section reviews the general aspects of power plant selection. These include questions such as how the procedure of procuring a new plant is initiated, how the plant size is determined, what factors influence the choice of fuel and site location, and how the plant capacity factor and fixed charge rate are calculated. There follows a detailed review of design and cost optimization procedures. This includes a review of capital costs for the turbine-generator units and for the boilers. Operating costs are computed based on constant incremental running rates. A worked example is presented and carried to the point of a 'present worth' evaluation. A brief discussion of the use of feed-water heaters, single- and multi-pressure condensers is provided. Some operational considerations including instrumentation and control and plant layout are discussed briefly. A separately bound Appendix includes a Heat Rate Table for General Electric turbines, and Westinghouse and General Electric price lists for both conventional and nuclear turbine-generator units. ENFORCEMENT LIMITATIONS IN WATER QUALITY CONTROL,
Federal Water Quality Administration, Washington, D.C.
Murray Stein.
Water Resources Bulletin, Vol 6, No 4, p 473-475, July-August, 1970.

Descriptors: *Water quality control, *Limiting factors, Jurisdiction, Water Quality Act, Public health, Legislation, Water policy, Navigable waters.
Identifiers: *Enforcement.

The Federal role in enforcement of water quality requirements began with the enactment in 1956 of the Federal Water Pollution Control Act. It has been expanded by successive amendments to the act to cover the pollution of navigable as well as interstate water which endangers the health or welfare of persons, and to cover violations of water quality standards established for interstate waters. Two different enforcement procedures are prescribed in the law to be followed in the two types of enforcement actions. While questions have arisen of jurisdiction, state's rights, and disregard or duplication of local efforts, such questions do not lastingly impede the exercise of Federal enforcement authority in the Statutory distinctions between interstate and intrastate pollution which govern the application of the enforcement authority, even though a case of intrastatepollution may be as serious or more serious than a case of interstate pollution. An additional limitation, results from the statutory time intervals between procedural stages in an action. Lack of data is a limitation but can always be overcome. State laws which protect the confidentiality of required reports are also a limitation. Investigative teams may obtain the needed information, however, for consideration in public meetings. Public support for effective water quality control measures, especially enforcement, and for the expenditures needed to enhance the environment, is widespread. Such support may be instrumental in modifying or eliminating existing statutory limitations. (Mariott-Chicago)

LAKE MICHIGAN SHORE WATER QUALITY SURVEY 1969, REPORT TO THE GOVERNOR AND THE 76TH GENERAL ASSEMBLY.
Illinois State Sanitary Water Board, Springfield.

Illinois State Sanitary Water Board, Report to 76th General Assembly, May 1970, p 31. 3 tab, 14 fig.

Descriptors: *Water quality, *Lake Michigan, *Illinois, *Water pollution, *Beaches, Turbidity, Phosphates, Bacteria, Coliforms, Water pollution sources, Plankton, Eutrophication.
Identifiers: Lake County, Cook County, Chicago.

The results of shore water monitoring showed bacteria, turbidity, floating debris,phosphates, and ammonia nitrogen counts in 1969 substantially higher than in 1968. It is hypothesized that a 50% increase in rainfall over the year contributed to this rise by causing the Metropolitan Sanitary District to allow backflow of polluted river water into Lake Michigan. On the North shore, where beach closings were numerous and where sewage treatment plants discharge into the Lake instead of the river watershed, many plants provide only primary treatment: all are operating in excess of their design capacities. The North Shore Sanitary District is constructing new facilities which will discharge a high quality effluent into the Illinois River watershed. The MSD is developing a program to resolve its drainage problem. While adequate standards and authority to control pollutional discharges exists, new legislation is needed to assist in the implementation of plans and needed pollution control facilities. Plankton counts, an indicator of lake eutrophication, were less than half the magnitude of the 1968 averages. (Wexman-Chicago)

ESTUARINE CLEAN WATER COST-BENEFIT STUDIES,
International Water Pollution Research Conference (5th).
R. Stone, and H. Friedland.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper III-17. 8 p, 8 tab.

Descriptors: *Benefits, *Economics, *Evaluation, *Cost-benefit analysis, *Social aspects, Intangible benefits, Intangible costs, Social values costs, Value.
Identifiers: *Socio-economic values.

A socio-economic analysis was made of the beneficial uses of San Diego Bay in relationship to the improvement of the Bay's water quality following diversion of sewage from the bay to the Pacific Ocean in 1963. An initial approach based upon land values found that areas within 8 miles of the bay increased 27% more than land values of a zone up to 15 miles more distant. Approximate costs are tabulated of several alternatives including three degrees of treatment and diversion of effluents to the ocean. Economic benefits are stated for various recreational uses with alternative treatment programs. (No basis is given for these benefits). An 'algorithm' was derived to evaluate intangible social costs and benefits. This consists of mean weighting of social values on a non-monetary scale by a number of individuals, and the further assumption that the social intangibles thus evaluated should be given a monetary value of 60, 80 or 100% of the over all economic benefits. With these socio-economic values and various assumptions, optimum courses of action were derived. (Whipple-Rutgers)

PHYSIOCHEMICAL AND MICROBIOLOGICAL PROPERTIES OF URBAN STORM WATER RUNOFF,
Swedish Inst. for Surface Chemistry.
G. Soderlund, H. Lehtinen, and S. Friberg.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 1, 1970. Preprint, Paper I-2. 8 p, 18 fig.

Descriptors: *Storm runoff, *Chemical properties, *Microbiology, Sampling, Physical properties, Runoff, Nitrogen, Coliforms, Biochemical oxygen demand, Phosphorus, Water pollution effects.
Identifiers: Urban runoff, Lead, Suspended solids, Volatile solids, Sweden.

In Sweden today a separation of storm and sanitary sewers is usually preferred. This avoids the discharging of mixed storm water and waste water into the streams and inland waters. There is an increasing discussion as to whether the direct discharge of storm water into streams can be justified for the future. A study to collect more information concerning the nature and extent of the pollutional load from highly urbanized areas was made. The results of this study showed that the discharging of snow melt from heavily trafficed areas into streams and inland waters contributes in a great extent to the pollution of the recipients with oil and heavy metals. Traffic roads give a high degree of contamination as compared with the other test areas. The oil in the storm water is contaminated with oil not only from the traffic but also an unexpectedly great extent from other areas, especially the industrial areas. As the use of cutting oils and emulsions, dry cleaning liquids and industrial cleaning liquids is still increasing, since the problem of collection and destroying such waste liquids must be solved. The various measurements were taken in very different areas with respect to traffic intensity. The analytical values obtained represent a skewed distribution. Nearly 50% of the dry residue obtained from warm water runoff is volatile material, probably asphalt from the roadway, rubber from tires and oil. Other constituents measured in concentration versus time were chloride, pH, nitrogen, phosphorus, coliforms, carbohydrates, and BOD. (Hancuff-Texas)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

LEAST SQUARES ESTIMATION OF CONSTANTS IN A LINEAR RECESSION MODEL,
Kentucky Univ., Lexington.
L. Douglas James, and William O. Thompson.
Water Resources Research, Vol 6, No 4, p 1062-1069, August 1970. 8 p, 2 tab, 12 ref. OWRR Project A-001-KY.

Descriptors: *Statistical methods, *Data collections, *Recession curves, Gaging stations, *Streamflow forecasting, *Hydrologic data, Least squares method, Regression analysis, Base flow, Hydrograph analysis, Runoff forecasting, Model studies, Mathematical models.
Identifiers: Streamflow recession.

Least squares can be used for estimating constants in a linear recession model from published average daily streamflows. A model with two recession constants was derived and successfully tested on a number of Kentucky streams. It can be used to estimate recession constants from daily streamflows stored on magnetic tape or punched cards without resorting to time-consuming graphical techniques. Equations and procedures are provided for recessions represented by either one or two recession constants using both a weighted and unweighted estimation procedure. In applying the two techniques, empirical evidence indicates the simpler unweighted procedure is preferable. (Knapp-USGS)

Cornell Univ., Ithaca, N.Y.; and Geological Survey, Arlington, Va.
Charles ReVelle, and William Kirby.
Water Resources Research, Vol 6, No 4, p 1033-1044, August 1970. 12 p, 6 fig, 2 tab, 3 ref.

Descriptors: *Decision making, *Linear programming, *Reservoir design, *Reservoir operation, *Optimization, Water yield, Reservoir yield, Mathematical models, Water management (Applied), Water storage, Evaporation, Water yield improvement, Stochastic processes.
Identifiers: Reservoir yield optimization, Reservoir management.

The application of linear decision rules to reservoir management and design is extended in two directions. First, an improved linear decision rule is derived for reservoirs suffering evaporation losses. Release commitments generated by this rule are based on the storage at the beginning of the period, the predicted evaporation depth in the period, and the linearized storage area curve of the reservoir. A clearer and more rigorous derivation of the chance constraints, including the effects of both evaporation losses and possible failures to meet previous commitments, is presented. Second, several reservoir performance measures are formulated as objective functions that can be optimized linear programing. These performance measure include expected and reliable values of storages and releases, deviations from targets, and reliabilities of achieving stated goals. (Knapp-USGS)

THE OPTIMIZATION OF THE OPERATION O A MULTI-PURPOSE WATER RESOURC SYSTEM,
Federal Water Quality Administration, Washin ton, D.C.; Virginia Polytechnic Inst., Blacksbu Dept. of Civil Engineering; and Water Resourc Engineers, Inc., Walnut Creek, Calif.
William N. Fitch, Paul H. King, and George K. Young, Jr.
Water Resources Bulletin, Vol 6, No 4, p 498-51 July-August 1970. 21 p, 6 fig, 13 tab, 10 ref.

Descriptors: *Systems analysis, *Optimizatio *Water resources development, Reservoir desig Reservoir operation, Water management (A plied), Computer programs, Planning, Watersh management, River basin development.
Identifiers: Water resource optimization.

The objective of any water resource system is transform the natural waters of a river basin into form such that optimal use of these waters w result. Thus the water may be transformed in electrical energy, transferred in space for wat supply and irrigation, transferred in time for flo control and maintenance of adequate streamflow or simply retained for use as a means for achievi waterbased recreation. This paper discusses means for determining how a given system shou be operated to maximize the net benefits. An exa ple of the type of tradeoff which occurs in such system is the conflict between power generati and flow augmentation. The answer to the trade problem can be found by utilizing the systems a proach. An algorithm is presented which optimiz the performance of a system in the context of t objective. The technique is applied to a basin to lustrate the type of answer that results from the a plication of the model. The optimization of a wat resource system consisting of three multi-purpo reservoirs and five waste treatment faciliti required 2.4 minutes of IBM 360/65 time. T system had 42 possible combinations of reserv levels. The computer time would increase appro mately in proportion to the square of the number possible combinations of reservoir levels. (Knap USGS)

A CRITERION FOR INVESTING IN INFORM TION,
New York Univ., N.Y.
Joel Owen.
Management Science: Application, Vol 14, No Aug 1968, p B715-B720. 6 p, 2 ref.

Descriptors: *Decision making, Risks, Costs, Da Investment.
Identifiers: Decision theory.

In numerous water resources planning situations, decisions must be made based on incomplete information. A procedure by which the decision maker can choose between two courses of action; one, to make a decision based on existing information or two, to institute a study program i.e., to invest in information before making a decision, was developed. Both choices involved risk and depended on the cost of analyzing data, the number of people involved and the value of the information gathered. Decision Theory provided a framework for the view adopted. The risks involved in the binary decision problem was defined explicitly. A model and assumptions were presented. The risk of immediate decision whereby the decision maker uses his own judgment was described. The risk of investing in information was also given. The risk or opportunity loss including the price of the study was computed and compared with the risk of immediate decision. As an aid to the decision maker unfamiliar with the specifics of the theory, answering a series of questions will allow him to determine the parameter values to be used in reaching the minimum risk action. An example was presented to illustrate the decision procedure. Comments were offered on the general use of the risk comparison concept used. (Kriss-Cornell)

FUNDAMENTAL ISSUES IN THE SIMULATION OF HUMAN BEHAVIOR: A CASE STUDY IN THE STRATEGY OF BEHAVIORAL SCIENCE,
Pittsburgh Univ., Pa. Graduate School of Business.
Ian I Mitroff.
Management Science: Application, Vol 15, No 12, Aug 1969, p B-635-B-649. 15 p, 34 ref.

Descriptors: *Simulation analysis, *Computers, Data, Analytical techniques, Model studies, Testing, Behavior.
Identifiers: Turing's test.

A report was presented on selected aspects of the actual growth and development of a simulation project, especially as the process affected the development of a novel method for validating simulation models. A philosophical analysis of the concept of simulation, especially as the analysis formed an integral part of the study's development was also given. The paper's main thesis was that the teleology or purpose behind the construction of the simulation model was an ever present taskmaster guiding and influencing all the phases of the model's construction and validation. One such test for validation of the model mentioned is Turing's test based on the notion of an 'imitation game'. The question asked during any test of validation were said to be the same at every level: 'What are we testing, the data or the theory by which the data was collected.' The two basic approaches to reality that investigators of simulation assume, labeled rationalism and empiricism, were discussed. Experimentalism and Man-Machine Dialectics were also described in detail. This paper has application to water resources simulation model studies in which decision makers are required to interact with the model. (Kriss-Cornell)

CAPACITY EXPANSION FOR INDIA'S NITROGENOUS FERTILIZER INDUSTRY,
Agency for International Development, Washington, D. C.
Donald Erlenkotter, and Alan S. Manne.
Management Science: Application, Vol 14, No 10, June 1968, p B553-B572. 20 p, 2 fig, 10 tab, 3 ref, 1 append.

Descriptors: *Project planning, *Decision making, Investments, *Demand, Chemicals, Fertilizers, *Optimum development plans, *Economies of scale, Costs, *Computer models.
Identifiers: *India.

A preinvestment survey for a massive investment program under way to meet increased demand for chemical fertilizers in India was presented. It intended to provide a rough framework within which to draw up a detailed proposal on the next few units for the chemical fertilizer industry built. The initial premises for a specific project were: when, where, and how large a plant to construct. The problem of optimal plant size centered about the fact of economies-of-scale in investment costs. An attempt was made to calculate the size, location and time-phasing for nitrogenous fertilizer capacity so as to minimize the discounted costs of satisfying future demands. Cost comparisons were made between alternative configurations of plant size and time-phasing for six refinery-oriented producing locations. A constant cycle model, rather than dynamic programming, was used to make the comparisons. An over-all cost comparison between two plant sizes was obtained through use of the basic parameter values. A static location model for 1974 was designed as a conventional type. Computer results for the model were summarized. The appendix gave the derivation of the formula extending the costs for a two-location two-phase cycle plant size model to n locations with equal increments of demand growth and identical inter-area shipping charges. (Kriss-Cornell)

SEPARABLE MARKOVIAN DECISION PROBLEMS,
Rand Corp.
Eric V. Denardo.
Management Science: Theory, Vol 14, No 7, March 1968, p 451-462. 12 p, 1 fig, 14 ref.

Descriptors: *Markov processes, *Decision making, *Optimization, Model studies.

Numerous water resources optimization and simulation models are based on a Markov process. The special structure of a class of Markovian decision problems was exploited to simplify the determination of optimum policies. A Markov renewal programming model was first reviewed. The special structure of Problem I was exploited in two closely interrelated ways: a streamlined Markovian decision problem called Problem II was identified and shown to be equivalent to Problem I; and Problem I was analyzed in a manner which accounted in part for the streamlining in Problem II. Two examples of separable Markovian decision processes provided illustrations of notational devices and indicated the breadth of the class of separable problems. Streamlined approaches were presented for dealing directly with the original problem and the particular inventory model example was further simplified. (Kriss-Cornell)

ON AN ALGORITHM FOR THE SOLUTION OF MIXED INTEGER PROGRAMMING PROBLEMS,
State Univ. of New York, Buffalo.
Stanley Zionts.
Management Science: Theory, Vol 15, No 1, Sept 1968, p 113-116. 4 p, 5 ref.

Descriptors: *Optimization, *Program, Variability.
Identifiers: Algorithm, Mixed integer programming.

A variety of mixed integer programming models have been proposed for the solution of water resources problems. Details of the author's suggestion for more compact representation of integer constraints in an algorithm for the solution of Mixed Integer Programming Problems referred to in an article by Norman J. Driebeek (Management Science, March 1966) was given. Familiarity with Driebeek's paper was assumed for the presentation. Driebeek represented an integer variable as a sum of a set of zero-one variables. Changes were made to Driebeek's algorithm and were summarized as follows: (1) Solve for the noninteger optimal. If integer halt; (2) compute the penalties as in the original paper; (3) choose a trial solution based on the penalties and proceed to it by introducing variables into the basis that are to be basic in that trial solution; (4) if a feasible integer solution is found, it should be noted and used to determine whether any further solutions need be tested as in Driebeek's algorithm. An optimal solution to the example of Driebeek, using the alteration to Driebeek's method was presented. (Kriss-Cornell)

STOCHASTIC SENSITIVITY ANALYSIS OF MAXIMUM FLOW AND SHORTEST ROUTE NETWORKS,
Rand Corp.
Richard D. Wollmer.
Management Science: Theory, Vol 14, No 9, May 1968, p 551-564. 14 p, 17 ref.

Descriptors: *Stochastic processes, Routing, Analytical techniques, Variability.
Identifiers: Algorithm, Maximum flow, Sensitivity problems, Max-flow Min-cut theorem.

An algorithm used to solve two types of network sensitivity problems was presented. In the first, arcs were subject to breakdowns that degrade their capacities. An undirected source-sink planar maximum flow network was given in which each arc was subject to anywhere from 0 to n breakdowns. It was required to find the maximum possible effect of n breakdowns on maximum flow. In the second, arcs were subject to improvements that reduced their lengths. A shortest route network was given in which each arc was subject to anywhere from 0 to n improvements. It was required to find the maximum possible effect n total improvements can have on shortest path length. Capacities resulting from breakdowns and lengths resulting from improvements were random variables specified by their mean values and variances. The central idea in solving of maximum flow network problems was summarized in the max-flow min-cut theorem. Justification for the algorithm used was described in detail. The algorithm would be practical provided the number of labels in each set remained small. (Kriss-Cornell)

DISCRETE STOCHASTIC PROGRAMMING,
California Univ., Davis.
K. D. Cocks.
Giannini Foundation Paper 282. Management Science: Theory, Vol 15, No 1, Sept 1968, p 72-79. 8 p, 4 tab, 8 ref.

Descriptors: *Linear programming, *Stochastic processes, Mathematical models, Variability, Constraints.
Identifiers: *Multistage problems, Passive programming, Active programming.

A method for solving water resources and other linear programming problems where (any number of) the functional, restraint, and input-output coefficients were subject to discrete probability distribution, was presented. The objective function was formulated in terms of variance and/or expectation. The method of stochastic programming presented was devised primarily to deal with multistage problems but, to demonstrate flexibility, the general explanation was in terms of an active programming approach and examples and a heuristic discussion was used to bring out the multistage possibilities. Initially, the prior allocation which maximizes expectation was derived and then the model was quadraticized for maximizing a function of expectation and variance or for deriving the E-V efficient set. The procedure involved the simultaneous generation of all (mutually exclusive) possible outcomes and hence the transference of all variability into the objective function of a very much enlarged linear program. This was a 'constrained passive programming' or 'constrained active programming' technique, at least in multistage applications. (Kriss-Cornell)

SYSTEMS OF DEMAND EQUATIONS: AN EMPIRICAL COMPARISON OF ALTERNATIVE FUNCTIONAL FORMS,
Chicago Univ., Ill.
Richard W. Parks.
Econometrica, Vol 37, No 4, p 629-650, October 1969. 8 tab, 30 ref.

Descriptors: *Demand, Statistical methods, Estimating.
Identifiers: *Indirect addilog system, *Linear expenditure system, *Differential logarithmic system, Demand equations, Consumer demand, Econometrics, Specification, Parameters.

A variety of complete systems of demand equations have been proposed for econometric use. These systems give strong allegiance to classical demand theory, and most introduce restrictions in order to simplify the model and reduce the number of parameters. Theoretically, however, none of the models dominates its competition. The choice of specification for empirical work must then be made on an empirical basis: which model performs best. This paper considers three demand models: the indirect addilog system, the linear expenditure system, and the differential logarithmic system. The paper provides a comparison of the models in terms of both their theoretical properties and their empirical usefulness. Section 2 of the paper compares the models in terms of their theoretical properties. Section 3 presents the empirical results for the models, the parameter estimates, and certain test statistics that are used to compare the empirical validity of the models. Section 4 introduces certain auxiliary statistics that allow a detailed comparison of the model's performance. This article provides a comprehensive review of factors to consider when estimating water demand equations and should be of value to research concerned with water demand estimation. (Loeb-Rutgers)

COMMUNITY LEADERSHIP AND WATERSHED DEVELOPMENT,
Mississippi State Univ., State College. Water Resources Research Inst.
K. P. Wilkinson, and R. N. Singh.
Available from NTIS as PB-194 455, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Mississippi Water Resources Research Institute, August, 1970. 62 p, 13 tab. OWRR Project A-035-MISS (1).

Descriptors: Behavior, *Watershed management, Psychological aspects, Social aspects, *Social participation.

This study was intended to assess correlates of levels of involvement of local community leaders in small watershed projects under P. L. 566. Three key actors in each of eleven completed watershed projects in Mississippi were interviewed in depth to identify actors, associations and activities. A survey was then conducted in each watershed of those persons most frequently named as having been significant actors. Detailed interview schedules were completed on 114 actors. The principal measure of the dependent variable consisted of a profile of the actor's performance of the discrete roles which had been identified through interviews with key informants. A high level of intercorrelation of this with seven alternative measures was found. Bivariate analysis gave substantial support to the general hypothesis that intensity of participation in a watershed project is related to generality of commitment to and participation in community action. Also found was a relationship between participation in the watershed project and probability of personal, economic benefit.

THE ENGINEERING AND MANAGEMENT OF AN EFFECTIVE SYSTEM,
International Systems Co.
Donald S. Feigenbaum.
Management Science: Application, Vol 14, No 12, Aug 1968, p B-721-B-730. 10 p.

Descriptors: *Management, Engineering, Systems analysis, Design, Programs, Costs.

A review of engineering and management of truly effective systems with a consideration of the form taken by the systems concept today was presented. The general operational form that the concept takes was readily stated where the key to the approach of modern systems engineering, including water resources systems engineering, is that changes in equipment and manpower content; in interrelationship structure; in information flow; and in management and control of these systems must be accomplished not only in terms of their own improvement but in terms of their impact on total effectiveness. Four system characteristics were of interest: (1) systems structures have become extended, intricate, and involved; (2) the more traditional manpower, machine and information elements have been replaced and upgraded by more complex and intricate production equi ments, data processing setups and specializ professionals; (3) the economics of improveme planning has too often been based on the self ins lated cost islands of traditional bookkeeping; a (4) the total systems structures often are not und direct management and engineering control of t company. Systems management, used to integra scientific, behavioral and mathematical disciple was described. (Kriss-Cornell)

RURAL-URBAN DIFFERENCES REFLECTE IN OUTDOOR RECREATION PARTICIPATIO
Forest Service (USDA)., Seattle, Wash.
John L. Hendee.
Journal of Leisure Research Vol 1, No 4, p 33 341, Autumn 1969.

Descriptors: *Outdoor recreation, *Motivatio *Use rate, Social aspects, Rural sociology, Urb sociology, Population, Values, Environment, E ployment, Recreation demand, Economic impa Transportation.
Identifiers: *Residence participation, Populati density, Cultural differences, Familiarity.

It is pointed out that in many studies of outdo recreation residence is an important variable. T is true in studies of water recreation where ru and urban participation differences are usually sumed. The paper examines several theories th seek to explain this condition and finds them to cast in general, ambiguous terms and difficult test empirically. Many methodological proble must be overcome and the traditional lack of rig characteristic of recreation studies, eliminated. N tional surveys have found economic and soc states, and age to be more important than residen in recreation participation so that theories based the latter are apt to be misleading. Future theori should be built around more theoretically justifi ble factors. (Murphy-Rutgers)

THE THEORY OF PRICE DETERMINATION GOVERNMENT-INDUSTRY RELATIONSHIPS
Louisiana State Univ., New Orleans; and Oh Univ., Athens.
A. M. Agapos, and Paul R. Dunlap.
Quarterly Journal of Economics, Vol LXXXIV, N 1, p 85-99, February 1970. 7 fig.

Descriptors: *Governments, *Prices, *Monopo Industries, Profit, Costs, Procurement, Contrac Political aspects, Employment, Legal aspects.
Identifiers: *Price determination, *Monopso *Bilateral monopoly, Output, Industrial capacity.

There have been attempts to explain monopoli monopsonist environments through vario techniques where the established objectives of t parties are considered to be inconsistent and determinate. Generally, in an exchange confined two parties, it is assumed that the one with greatest bargaining power will theoretically dict the outcome. The usual approach of explaini government operations with industry is the conce of bilateral monopoly, where the government is monopsonist and the contracting firm is monopolist. The prevailing explanation is that contractor seeks to maximize profits and government tries to minimize costs. However, t explanation is shown to be inadequate and hind the understanding of the government-industry re tionship. This paper explains how a governmen single source contract is different from the conve tional bilateral monopoly and then develops mathematical model for this government-indus relationship. A more general model is provided multisource procurements. A general mathema cal model covering all government-industry re tionship is supplied. As such, this is useful in water area where government may be the s buyer of a water resource or contractor for work water resource projects. (Loeb-Rutgers)

escriptors: *Regulation, *Electricity, *Prices, rofit, Demand, Marginal costs, Estimating, Costs, onstraints.
lentifiers: *Electric utility prices, Electric utilities, larginal revenue.

he objective of this study is to measure the effecveness of the regulatory process in reducing rices to residential users of electrical utilities. In it, e marginal cost for 62 private electric companies nd 7 municipal ones are computed and the deand curves facing them are estimated. From these nctions, the profit-maximizing prices, p sub m, re estimated and compared with the actual prices harged to indicate the effectiveness of regulation. hort run marginal cost is estimated using Federal ower Commission cross sectional data on produon costs for steam plants. Demand is estimated om cross sectional statistics on residential conmption, electricity prices, and natural gas prices. olving for the profit maximizing price by setting e marginal revenue function equal to marginal osts indicates that regulation has reduced prices nly slightly on average for the Investor Owned tilities. Municipal power companies, however, harge considerably less than the profit maximizing rice. This methodology may prove applicable to e water area when attempting to measure the efctiveness of regulation in reducing prices for the se of water supply facilities. (Loeb-Rutgers)

HE EXISTENCE OF AGGREGATE PRODUCION FUNCTIONS,
lassachusetts Inst. of Tech., Cambridge.
ranklin M. Fisher.
conometrica, Vol 37, No 4, p 553-577, October 969. 28 ref.

escriptors: *Aggregates, Labor, Capital.
lentifiers: *Aggregate production function, Effiiency, Capital aggregation, Production function, abor aggregation, Output aggregation, Approxiation, Fixed capital.

he estimation and use of aggregate production nctions has become a widespread and important ractice in economic analysis. Such uses fall into wo main classes. On the one hand there has been ajor efforts in the estimation of aggregate producon functions for entire economies, for manufacuring, for durables, etc. These papers have made mpirically derived inferences about the imortance of technical change; about the rate of eturn to investment, social or private; about the hare of wages in national product; and, generally, bout the technical and economic forces making or growth. On the other hand, aggregate producon functions have been used to represent technial possibilities of an economy in which some interemporal welfare function is maximized or as a asic constituent of a one or two-sector descriptive rowth model. In both problems, the use of an aggregate relatonship between an output aggregate nd constructs called 'labor' and 'capital' is a conenience. The author examines the circumstances nder which technological relationships can be ubsumed in an aggregate form and discusses the nferences from such a model and its approximaon to the real world. This article would be relevant to the empirical studies of water production nctions. (Loeb-Rutgers)

STIMATION OF JOINT PRODUCTION FUNCTIONS,
ennsylvania Univ., Philadelphia; and Stanford Jniv., Calif.
. J. Dhrymes, and B. M. Mitchell.
conometrica, Vol 37, No 4, p 732-736, October 969. 1 tab, 1 ref.

Descriptors: Economics, Estimating, Least squares method.
Identifiers: *Estimation, *Joint production function, Canonical correlation.

In a recent paper, H D Vinod has suggested canonical correlation analysis as a technique of consistently estimating the parameters of joint production functions. While it is not clear that he intended this technique to be applicable to all possible specifications of such functions, it is presumably applicable at least to the explicity formulation he considers. In this note the authors show several things: first, Vinod's formulation contains an error; second, in the case p—q, canonical and ordinary least squares analyses are equivalent; third, if p does not equal q, then the canonical estimators cannot be consistent unless OLS estimators are as well. This paper may prove applicable to the water area in cases where econometric methods are used to estimate relations in the form of a joint production function. (Loeb-Rutgers)

THE COST OF CAPITAL AND INVESTMENT CRITERIA IN THE PUBLIC SECTOR,
Lehigh Univ., Bethlehem, Pa.
Eli Schwartz.
The Journal of Finance Vol XXV, No 1, p 135-142, March 1970.

Descriptors: *Capital, *Costs, *Government, *Investment, Economic evaluation, Interest rate, Discount rate, Optimization, Risk, Benefits, Taxes, Income, Debt, Prices, Profit, Economic efficiency.
Identifiers: *Pareto optimum, *Present value, Social time preference, Social benefit, Rate of return.

There has been considerable controversy regarding the problem of government investment under the assumption that biases against government spending, frictions in the capital market, and a systematic divergence between the non-risk interest rate and the rate of return required for private investment prevent an equality between marginal social time preference and marginal social benefit. This article attempts to prove that these biases are exaggerated. The market cost of capital can be used to approach Pareto optimality in rationing capital between the public and private sector. The author shows that the social cost of capital must be higher than the government's borrowing rate since the government's borrowing rate arises from the government's legal superiority as a borrower against the private holders of all claims. This paper has implications for the extent of government investment in water resources and is relevant to water studies using social discount rates for investment decisions. (Murphy-Rutgers)
W70-10192

COMMENT ON VOTING AND SOCIAL CHOICE,
Indiana Univ., Bloomington.
Alfred Broaddus.
The American Economist, Vol 14, No 1, p 45-46, Spring 1970.

Descriptors: *Welfare preferences.
Identifiers: *Voting, *Social choice, *Social welfare function, Social ordering, Transitivity, Aggregate cycling phenomenon, Binary relation, Indifference, Voting class.

The author states that Campbell's paper is a closely reasoned attempt to extend and modify the results regarding social welfare functions achieved by Kenneth Arrow. Campbell found a family of social welfare functions, neither imposed or dictatorial, satisfying a set of conditions which includes a modified version of the original Arrow conditions. Campbell's social welfare function (R sub a) or rule for passing from individual to social orderings is such that social orderings established by it are transitive. This is accomplished at the prive of including a possible aggregate cycling phenomenon (C sub a) within the definition of the binary relation R sub a. The author feels that this inclusion weakens the intuitive appeal of Campbell's results. The author believes that Arrow's Condition 4 and 5 are simply Campbell's Conditions 7 and 6, respectively. In Section 3, Campbell demonstrates that any social welfare function satisfying his seven conditions must belong to the 'voting class'. Here the relevant question is whether or not all members of the 'voting class' satisfy Conditions 1-7. The theoretical use of a social welfare function or of social orderings is implied in the water area when deciding whether or not to invest in a particular public project. (Loeb-Rutgers)

PUBLIC BUDGETING AND FINANCE,
Georgia Univ., Athens.
Robert T. Golembiewski.
Itasca, Illinois, Peacock Publishers, 1968, 592p.

Descriptors: *Budgets, Planning, *Economic analysis, Forecasting, Management, Government, Decision-making, Financing, Management, Costs, Taxes, Subsidies, Optimization, Model studies, Control, Social aspects.
Identifiers: *Public budgeting, *Public finance, Budgetary procedure, Economic policy, Institutional aspects, Administrative problems, PPB.

A collection of readings is presented dealing with various aspects of public budgeting. It should be of interest to the water researcher since it provides the reader with an understanding of the numerous complexities and functions of budgeting in the public sector, where much of the water resource investment occurs. It first discusses the concept of what a budget is, how well it achieves its purpose and who should prepare it. The book then explains some of the aspects of the institutional contexts of public financing and budgeting followed by a group of articles relating some of the economic policy contexts. Some of the analytic models and actual patterns of decision-making are described, as well as the control function of budgeting. There are some articles on the behavioral and organizational contexts of public budgeting and finance with a final section on the budgetary process as a form of management. (See also W70-10197 thru W70-10200) (Murphy-Rutgers)
W70-10196

BUDGETS: DEFINITION AND SCOPE,
Texas Univ., Austin.
Andrew C. Stedry.
In: Public Budgeting and Finance, Itasca, Illinois, Peacock Publishers, 1968, p 6-14.

Descriptors: *Budgets, *Economic evaluation, *Planning, *Cost, *Economic efficiency, *Control, Industrial production, Forecasting, Management, Variance, Optimization.
Identifiers: *Standard costs, *Standards, Goals, Motivations, Budget control system.

The author defines what a budget actually is and states that its two major functions are to serve as a plan for future actions and as a means of control to encourage economic efficiency. These two functions are often interlaced to the point of indistinguishability but the author believes that the equality of figures used for the control and planning budgets is not necessarily correct. The author attempts to convey the applicability of the treatment of budgets to control systems, using standards and standard costs as elements of control, by discussing the similarity of the various elements. The concluding section evaluates the process by which the control given by the budget is exercised. As a means of increasing the effectiveness of the budgetary controls in the water resource area, this article deserves the interest of the water researcher. (See also W70-10196) (Murphy-Rutgers)
W70-10197

PERSPECTIVES ON POPULATION AND RESOURCES,
Resources for the Future, Inc., Washington, D.C.
Joseph L. Fisher.

In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, p 104-109, 1965.

Descriptors: *Natural resources, *Population, Conservation, Technology, Water resources, recreation, Forecasting, Economic justification, Research and development, Irrigation, Optimization, Capital, Investment, Water pollution, Water quality, Economic impact.
Identifiers: *Economic adaptations, Resource enterprises, Population growth, Leisure time, Capital formation.

The large problems are discussed which grow out of the resources- population relationship. He cites several studies which resulted in forecasts of United States population, demand for natural resources, and resource supply problems as far in the future as 2000. A pessimistic future was indicated unless: economic adaptations of techologic trends continue, resources can be obtained from foreign sources, or resource undertakings improve in farsightedness and consistency. Resource adequacy for the United States of a resource such as water was indicated as optimistic, although problems were likely to occur, such as having enough good quality fresh water in a particular place. The author suggests that cautious optimism is indicated due to recent advances, such as interest in stream pollution, improvement in water pollution abatement techniques, and inception of water quality control based on analysis of hydrologic, chemical and economic data. However careful control over the trends and forces influencing both population and resources is suggested, so that needed changes can be made. (See also W70-10196) (Murphy-Rutgers)
W70-10198

ECONOMICS AND THE APPLIED THEORY OF PUBLIC EXPENDITURES,
Minnesota Univ., Minneapolis.
Walter Heller.
In: Public Budgeting and Finance, Itasca, Illinois, Peacock Publishers, p 170-179, 1968.

Descriptors: *Budgeting, *Economic analysis, *Government, *Public benefits, Economic efficiency, Income, Cost minimization, Taxes, Benifits, Welfare economics, Prices, Industrial production, Subsidies, Profit.
Identifiers: Public goods, Stabilization, Want-satisfying, Voter preferences.

This paper is designed to show; where the economist can offer some useful counsel on the theory of government functions as they effect the budget, to indicate some lines along which promising work is being done, and to suggest certain limitations or constraints within which the economic criteria for dividing resources between public and private use must be applied. The author classifies and defines the basic economic objectives of government and studies the problems of determining the consumer's preferences for public goods and the maximum efficiency position between public and private economic control. The various methods of satisfying public wants are discussed from the point of view of minimizing costs. The paper concludes with a brief mention of some constraints on the application of specific economic criteria. The public good aspect of water resources should make this article of interest to the water researcher. (See also W70-10196) (Murphy-Rutgers)
W70-10199

CRITERIA OF EFFICIENCY IN GOVERNMENT EXPENDITURES,
Virginia Univ., Charlottesville.
Roland N. McKean.
In: Public Budgeting and Finance, Itasca Illinois, Peacock Publishers, p 516-521, 1968.

Descriptors: *Budgets, *Economic efficiency, *Economic evaluation, *Government, Systems analysis, Decision-making, Forestry, Management, Optimization, Maximization, Value, Prices.
Identifiers: *Personnel policy, *Economic criteria.

The author is concerned with the problems of choice and criterion difficulties in the attainment of efficiency. Particular emphasis is placed on the quantitative aspects of economic analysis. The process of maximizing economic efficiency usually requires a process of suboptimization which involves numerous complications in addition to inviting piecemeal analysis in decision-making. The proper criterion in economic evaluation is maximum output minus costs. As an example the author uses forest management to demonstrate the manner in which to choose among alternative sizes of the budget as well as among alternative personnel policies. The maximization of economic efficiency through the budget process is a problem continually faced by the water resources administrator. Accordingly, this article is relevant to the water resource planning process. (See also W70-10196) (Murphy-Rutgers)
W70-10200

INCOME REDISTRIBUTION AND SOCIAL CHOICE: A PRAGMATIC APPROACH,
Bowdoin Coll., Brunswick, Maine.
A. Myreck Freeman.
Public Choice, Vol VII, p 3-21, Fall 1969.

Descriptors: *Economic evaluation, *Income, Government, Optimization, Maximization, Taxes, Marginal analysis, Cost, Cost-benefit analysis, Decision-making, Federal government.
Identifiers: *Income distribution, *Social welfare function, *Paerto optimum, Utility possibility frontier, Government transfers, Social choice, Voting, Welfare maximization.

Modern formal welfare analysis points out the impossibility of ranking alternative positions on the utility possibility frontier due to the impossibility of making comparisons of individual utilities. However, many government programs, including many water resource development projects alter the distribution of income and thus this article is relevant to the water resource area. The author attempts to show that under plausible assumptions about behavior, individuals have incentives to develop institutions for making social choices about income distribution and that it is not unreasonable to assume that these choices reflect individual preferences. The article also attempts to provide a more pragmatic interpretation of the term social welfare function. The paper shows that if income distribution, chosen by individuals acting through some kind of political mechanism, can be assumed to be most preferred, this implies the existence of a social welfare function which has been maximized. If enough is known about the conditions under which this choice is made, the shape of this implied social welfare function can be determined. (Murphy-Rutgers)

DATA, RESEARCH, AND GOVERNMENT,
Yale Univ., New Haven, Conn.
Guy H. Orcutt.
American Economic Review, Vol LX, No 2, p 132-137, May 1970.

Descriptors: *Research and development, *Data collection, *Government, Population, Economic evaluation, Financing, Planning, Statistics, decision-making, Pollution, Computers.
Identifiers: *Economic research, *Social experimentation, *Institutional developments, Research institutes, Program evaluation.

How the federal government, foundations, and others can best aid the devleopment of more potent, social-problem and policy-orientated research is discussed. It should therefore be of value to those interested in increasing the quality and quantity of water resource economics research. The author favors real and relevant social experimentation and less of a dependence on government data collection for securing essential empirical evidence. Institutional developments are needed if essential collection of evidence i response to research requirements is to b achieved. The paper outlines these developmen and gives the sources from which the resources fo the proposed program would come. The paper co cludes with some general ideas on the financin evaluation and guidance of research program (Murphy-Rutgers)
W70-10202

P P B IN H E W: SOME MANAGEMENT IS SUES,
United States Conference of Mayors, Washingto D.C.
David R. Seidman.
Journal of the American Institute of Planners, V XXXVI, No 3, p 168-178, May 1970.

Descriptors: *Planning, *Budget, *Governmen *Economic evaluation, Management, Measur ment, Decision-making, Social aspects, Forecas ing, Systems analysis, Financing, Costs, Benefit Program, Risk.
Identifiers: *P P B, *Health Education and We fare, Agency conflict, Political difficulties progra structure.

Several issues are discussed on the operation of planning, programming and budgeting (P P B system. The author anticipates that the insights wi prove relevant to the operation of PPB in man agencies. Thus, those in the area of public wate resource investments should be aided in evaluatin their programs by a reading of this paper. Amon the issues covered are those of internal agency co flicts, measurement problems, and political di ficulties in introducing an innovative managemer technique into a very complex and often nonquan titative arganizational structure. The progra memoranda, program and financial plans, and spe cial analytic studies are discussed in the context H E W along with some of the problems involved i introducing PPB and developing it into an effectiv tool for decision-making. (Murphy-Rutgers)
W70-10204

THE CONCEPT OF CAUSALITY I ECONOMICS,
Illinois Univ., Urbana.
Julian L. Simon.
Kyklos, Vol XXIII, Fasc 2, p 226-254, 1970.

Descriptors: *Economics, *Correlation, Forecas ing, Interest rate, Income, Demand, Seasona Regression analysis, Time, Costs, Managemen Economic evaluation, Decision-making.
Identifiers: *Causality, *Logic, Spurious correl tion, Causal direction, Simultaneity, Advertising.

There has been no satisfactory definition of the us of the term causality in economics. No form definition of causality can be given that will enabl an economist to distinguish between those situ tions that are called 'causal' by most economist This paper attempts to supply an operation definition of causality that will aid the economist i distinguishing between those cases he wishes to ca causal and those he does not. Causal statements ar a sub-class of associations and gives an operation definition of causality that tests the followin characteristics of an association and its contex (A) predictability; (B) necessary side condition (C) spurious causality; (D) examination of how th case fits with economic theory. The potential cor fusion in many empirical water resource studie between correlation and causality should make th paper of interest to the water researcher. (Murphy Rutgers)

PROCEEDINGS AND ANALYSIS, WORKSHO ON THE PLANNING RESEARCH INTERFACE.
Maine Univ., Bangor. Water Resources Center.

Available from the NTIS as PB-194 565, $3.00 i paper copy, $0.65 in microfiche. University c Maine, 18-19 November 1969, p 88.

Descriptors: *Planning, *Interface, Research and development.
Identifiers: *Research, Water resources information, Workshops, Information exchange.

This workshop was designed to reveal the general nature of the interface dividing researches and planners. Ways were sought to manage, for increased public benefits; the reaction between researchers--as producers of water resources information, and planners--as consumers of that information. It was hypothesized that the information 'reaction' requires acceleration and should probably be reversible so that planners can stimulate the research process more directly. Two general lectures are included: 'A Case Study of the Minnesota Planning and Research Scene' and 'Planning and Problems of Interface'. Three discussion groups have been recorded. They included: 'Public Planning in Maine', 'Research--From Results to Relevance', and 'To What Extent are Research Inadequacies and Planning Failures Correlative.' Also included is a follow-up analysis of the workshops. (Davis-Chicago)

PLANNING AND PROBLEMS OF INTERFACE,
National Water Commission, Arlington, Va.
V. A. Koelzer.
In: Proceedings and Analysis, Workshop on the Planning/Research Interface, University of Maine, 18-19 November 1969, p 17-28. 1 fig.

Descriptors: *Planning, *Interface, Research and development, Institutions, Technology, Communication.
Identifiers: *Research, National water resources management.

Two topics are discussed. First, the tasks of the National Water Commission are outlined. A tentative program of 31 studies has been developed. These studies can be placed in four main categories: (1) studies to delineate future problems and needs; (2) studies to define the objectives of national water resources management, (3) studies to appraise existing institutional arrangements, (4) studies to provide a basis for recommending improvements in institutional arrangements. It is stressed that water resource planning should be recognized as a series of interim solutions rather than a final solution. Second, the problem of interfaces is discussed. Two types of planning interfaces are identified: the interface between research and planning and the interface between technical disciplines in planning. The major difficulty with the first interface is one of communication. Researchers frequently fail to present their knowledge in a form that is understandable to planners. Also there is a reluctance by planners to utilize new techniques that have not been operationalized due to lack of money and time. (See also W70-10351). (David-Chicago)
W70-10352

COMPREHENSIVE FLOOD PLAIN MANAGEMENT,
Office of the Chief of Engineers (Army), Washington, D.C.
George R. Phippen.
Water Resources Bulletin, Vol 6, No 4, p 640-647, July-August 1970. 3 fig, 3 ref.

Descriptors: *Water management (Applied), *Flood control, *Planning, *Flood plains, *Nonstructural alternatives, Flood damage, Cooperation, Open-space.
Identifiers: *Comprehensive flood plain management.

Comprehensive Flood Plain management is the special form of planning and action prompted by flood hazards. Much can be accomplished in the non-Federal sector, but there is also plenty of room for Federal-non-Federal cooperation. Appropriate use of the flood plain requires that hazards be resolved, and that this area function in concert with the larger community. Flood Plain Management objectives are stated in this context. The options for achieving these objectives range from high degrees of flood modification for intense development, as with flood control, to high degrees of susceptibility modification as achieved by public acquisition for open space. Although both forms of options merit consideration in all cases, flood modifying works are more likely to be indicated where a problem already exists, and susceptibility modifying options indicated where timely action can preclude inappropriate decisions. Portions of some flood plains are or will become intensively used or developed--in others, low intensity uses will be appropriate. In the usual case of a problem area the Corps will consider a mixture of current and future uses, and a combination of structural and nonstructural options will be embodied in the solution. (Mariott-Chicago)

THE MULTI-USER ZONE OF THE GULF OF MEXICO--ITS PROMISE AND PROBLEMS,
Texas A and M Univ., College Station.
Richard A. Geyer.
Water Resources Bulletin, Vol 6, No 4, p 580-587, July-August 1970. 5 fig, 2 tab.

Descriptors: *Coasts, *Management, *Gulf of Mexico, *Planning, Recreation demands, Environment, Industries, Jurisdiction, Coordination, Land use, Water utilization, Shore protection.
Identifiers: *Multi-user Zone.

There is an ever increasing intensification of the use of the coastal zone, including lake shores, as the expanding population of the United States moves into this area. Problems of conflicting use between industrial, commercial, recreational, and environmental interests are becoming more frequent. Coastal Zone Management must be concerned with provision of adequate recreational areas, industrial access and environmental preservation. To date effective coastal management has been thwarted by unclear jurisdictions and lack of coordination on the part of local, state and federal agencies. As the result of a two year study by the President's Commission on Marine Engineering and Resources, a number of specific recommendations are made for the Gulf of Mexico. Major recommendations include enactment of coastal management legislation, environmental conservation legislation, full utilization of land and water conservation funds, plans for better coordination between concerned agencies, support of feasibility and engineering studies relevant to the development of offshore industrial facilities, and review of enforcement procedures by federal agencies. Estimated costs of the various facets of the comprehensive plan for coastal management are summarized. (Mariott-Chicago)

AN ANALYSIS OF ALTERNATIVE METHODS OF FINANCING TYPES OF WATER RESOURCES FACILITIES IN MISSISSIPPI,
Mississippi State Univ., State College. Bureau of Business and Economic Research.
J. R. Pulley, and J. L. Roberts, Jr.
Water Resources Bulletin, Vol 6, No 4, p 522-527, July-August 1970.

Descriptors: *Financing, *Municipal water, *Water supply, Economic efficiency, Administration, Water rates.
Identifiers: Central Mississippi, Water Resources Facilities.

The purpose of the study was to investigate and anayze the alternative methods of financing types of water resources facilities used by selected communities in Central Mississippi, and to determine whether the method chosen was most feasible for the community. In the analysis an attempt was made to achieve four objectives: (1) determine the type of water facility needed in relation to use, (2) determine the underlying factors that cause this need, (3) determine the success of the financing method used, (4) determine and analyze any problem areas that arose as a result of the method of financing chosen. Only cities and communities in the process of expanding or constructing water facilities or which had done so during a five year period were studied. Two methods of financing water resource facilities; non-profit Water Associations serving villages and towns, and Municipal Water sources, are discussed in some detail, inciuding a discussion of the problems encountered with each. Principal problems associated with water system financing involve (1) size of municipality, and (2) overall direction of water system programs by competent and efficient administrators. Careful and proper planning is needed to alleviate problems and reach workable solutions. (Mariott-Chicago)
W70-10357

COMPREHENSIVE WATER PLAN, PHASE ONE.
Middlesex County Planning Board, New Brunswick, N.J.

Available from NTIS as PB-188 575, $3.00 in paper copy, $0.65 in microfiche. Comprehensive Master Plan, Part 8, October 1968. 50 p, 2 tab, 6 fig.

Descriptors: *Planning, *Water supply, *Water management (Applied), *Water distribution (Applied), Water sources, Water treatment, Water quality, Regulation, New Jersey, Water utilization.
Identifiers: *Middlesex County (New Jersey), Private on-lot systems, Public systems, Water resources usage.

This report inventories major private, municipal, and regional water supply systems serving Middlesex County Study Area. After a general discussion on nomenclature, private on-lot systems, public systems, and the usage and regulation of regional water resources, each water system is described in terms of its service area function, source of supply, and treatment, transmission and distribution facilities. (See also W70-10362) (Wexman-Chicago)
W70-10361

COMPREHENSIVE WATER PLAN, PHASE ONE: APPENDIX.
Middlesex County Planning Board, New Brunswick, N.J.

Available from NTIS as PB-188 576, $3.00 in paper copy, $0.65 in microfiche. Comprehensive Master Plan, Part TM 11, April 1968, p 45.

Descriptors: *Planning, *Water supply, *Water management (Applied), *Water distribution (Applied), Water quality, Water sources, Financing, Future planning (Projected).
Identifiers: *Middlesex County (New Jersey), Financing structure.

This appendix complements the Comprehensive Water Supply Plan, Phase One. It contains a physical description of all existing water supply facilities in Middlesex County and each of the 26 municipalities in the Study Areas. Service areas, source and capacities, water flow records, financing structure, problem areas and planned future projects are also briefly described. (See also W70-10361) (Wexman-Chicago)
W70-10362

PROCEDURES FOR EVALUATION OF WATER AND RELATED LAND RESOURCE PROJECTS, REPORT TO THE WATER RESOURCES COUNCIL BY THE SPECIAL TASK FORCE.
Water Resources Council, Washington, D.C.

Report, June 1969. 122 p, 1 tab.

Descriptors: *Evaluation, *Water resources, *Land resources, *Planning, Benefits, Costs, Water resources development, Analytic techniques, National income.

Identifiers: *Planning policies, *National objectives, Objectives, Regional development, Environmental enhancement.

This study is a review of present practices in the evaluation of benefits and costs in federal water resource projects together with several recommendations for revisions in current planning policies and practices. A statement of the national objectives for water resource development is presented; included are: national income, regional development, environmental enhancement, and well-being of people. This provides the framework in which the efforts of water and related land projects may be evaluated. For better communication and clearer presentation of information, these effects should be displayed in a system of accounts. Several critical issues that require special technical consideration are discussed. These include measurements of certain national or regional income changes arising from secondary effects, the treatments of costs and in some cases the definition of costs related to the national objective accounts, and formulation of plans in the context of several national objectives. (See also W70-10364 thru W70-10369) (Davis-Chicago)
W70-10363

SECTION I: INTRODUCTION.
Water Resources Council, Washington, D.C.

In: Procedures for Evaluation of Water and Related Land Resources Projects, Washington, D.C.: Water Resources Council, June 1969, p 6-15.

Descriptors: *Water resources, *Evaluation, Federal government, Water policy, Analytic techniques, Water resources development.
Identifiers: Federal policy, Policy.

A short history of the development of federal practices in the evaluation of water resource projects is undertaken. Emphasis is placed upon the development of present federal policy, stressing the increasing range of federal water resource development objectives and constraints placed upon evaluative techniques. Also discussed are some of the major contributions presented at a Water Resources Council hearing in conjunction with the preparation of the document. (See also W70-10363) (Davis-Chicago)
W70-10364

SECTION II: NATIONAL OBJECTIVES.
Water Resources Council, Washington, D.C.

In: Procedures for Evaluation of Water and Related Land Resources Projects, Washington, D.C.: Water Resource Council, June 1969, p 16-25.

Descriptors: *Water resources, *Evaluation, National income, Planning.
Identifiers: *National objectives, *Objectives, Regional development, Environmental enhancement, Well-being of people.

Four national objectives of water resource development are discussed; national income, regional development, environmental enhancement, and well being of people. National income measures the nation's output as the aggregate earnings of labor and property which arise from current and future production and the increase in national income attributable to a project is the measure of its contribution to this objective. Regional development objectives include: increased regional income, increased regional employment, improved regional economic base, improved income distribution, and improved quality of services. Environmental objectives include the conservation, preservation, creation, or restoration of natural, scenic, and cultural resources in order to enhance or maintain the quality of the environment. Well-being objectives consider the personal, group, and community effects of the project or program activity. These provide the framework in which the effects of water and related land projects may be evaluated. The details of these objectives are continually changing as national goals are defined and indeed new objectives might emerge. Comprehensive plans for water and related land resources use and development should be formulated in recognition of their contribution to all of these objectives. (See also W70-10363) (Davis-Chicago)
W70-10365

SECTION III: BENEFIT EVALUATION CONCEPTS.
Water Resources Councils, Washington, D.C.

In: Procedures for Evaluation of Water Related Land Resource Projects, Washington, D.C.: Water Resource Council, June 1969, p 26-53.

Descriptors: *Evaluation, *Benefits, *Costs, *Cost-benefit analysis, Water resources, Measurement, Associated costs, Induced costs, Tangible benefits, Intangible benefits.
Identifiers: Benefit evaluation concepts, Objectives, Primary benefits, Secondary benefits.

A number of basic evaluation concepts are discussed. Emphasis is placed on the evaluation principle that benefits and costs have meaning and can only be identified when directly related to objectives. Further, there is a need to clarify the definition of the specific type of benefits by function and their measurement standards in the context of all objectives and effects for resource development projects. The interpretation and modification of the general benefit definition is concerned with five areas requiring amplification: relation to objectives, identification of all beneficial contributions, measurement of benefit values, the 'with' and 'without' principle, and associated and induced costs. Also discussed were definitions of tangible and intangible benefits, and primary and secondary benefits. (See also W70-10363) (Davis-Chicago)
W70-10366

SECTION IV: NATIONAL OBJECTIVE ACCOUNTS.
Water Resources Council, Washington, D.C.

In: Procedures of Evaluation of Water and Related Land Resource Projects, Washington, D.C.: Water Resource Council, June 1969, p 54-65, 1 tab.

Descriptors: *Evaluation, *Analytic techniques, *Water resources, National income, Decision making.
Identifiers: *System of accounts, *National objective accounts, National objectives, Foregone opportunities.

A system of accounts is recommended that permits the display of the result of planning for any one national objective or any combination of national objectives. Under this system all national objectives are to be stated in quantitative terms to the extent possible, but not necessarily in national income terms. The formulation of comprehensive water resource programs involves two fundamental series of decisions: the choices among objectives and the choices of alternative means to achieve these objectives. The results of analyzing these potentials choices can be ultimately displayed in tables of national objective accounts. These tables include for each alternate plan, an accounting of the benefits and costs for that plan which are appropriate to each of the national objectives. Also included are the opportunities foregone by the adoption of a particular plan compared with each of the other plans. (See also W70-10363) (Davis-Chicago)
W70-10367

SECTION V: PLAN FORMULATION.
Water Resources Council, Washington, D.C.

In: Procedures for Evaluation of Water and Related Land Resource Projects, Washington, D.C.: Water Resource Council, June 1969, p 66-73.

Descriptors: *Evaluation, *Planning, *Wate resources, Formulation, Benefits, Optimization Methodology, Analytic techniques.
Identifiers: *Plan formulation, Objectives, Syste of accounts.

A number of considerations regarding plan formu lation are outlined. First, project plans may be for mulated to achieve any specified objectives withi the concept of the four major categories of objec tives. The evaluation of benefits over time is as sociated with projections of the needs for good and services. Water resource planning should al ways involve adequate representation from th area under study. Optimizing principles used i plan formulation for the national income objectiv do not serve as well in the plan formulation of th other objectives. Consideration must be given t complementary and supplementary projects an programs which may be involved. A more involve process is encountered with plan formulation wit multiple objectives. If a system of accounts is util ized to clearly show the effects and relationship of project to objectives, the method of optimizing on objective within constraints imposed by other ob jectives is an acceptable approach to multiple ob jective formulation. A more complex and difficul method would be to optimize multiple objective although this approach requires further research (See also W70-10363) (Davis-Chicago)
W70-10368

SECTION VI: EVALUATION PRACTICES AN MEASUREMENT TECHNIQUES.
Water Resources Council, Washington, D.C.

In: Procedures of Evaluation of Water and Relate Land Resource Projects, Washington, D.C.: Wate Resource Council, June 1969, p 74-119.

Descriptors: *Evaluation, *Measurement *Analytic techniques, Costs, Benefits, Alternativ costs, National income, Water supply, Irrigation Water quality, Flood control, Drainage, Recrea tion.
Identifiers: *Objectives, Land stabilization, Fis and Wild life, Use externalities, Resource immo bilities, Regional development, Environmenta enhancement, Well-being of people.

Evaluation practices and measurement technique are discussed for each of the objectives. The use o alternative costs as a measure of benefits is also ex amined. Within the national income objective number of primary benefits are analyzed: wate supply, irrigation, water quality control, navigation electric power, flood control and prevention, lan stabilization, drainage, recreation, and fish an wild life. Secondary national income benefits ar discussed stressing conditions for identification use externalities and resource immobilities requirements; and general measuremen techniques. The other objectives, regional develop ment objectives, environmental objectives, an well-being objectives are also discussed. (See als W70-10363) (Davis-Chicago)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

THE TRUE RATE OF RETURN AND TH REINVESTMENT RATE,
Columbia Univ., New York.
Michael Adler.
The Engineering Economist Vol 15, No 3, p 185 187, Spring 1970.

Descriptors: *Economic evaluation, *Investment, Capital, *Costs, Profit, Economic life, Optimization, Decision-making, Income, Management, Uncertainty.
Identifiers: *Internal rate of return, *Net present value, *Reinvestment rate, Sinking fund, Depreciation, Profit rate.

It is important, in water resources investments, that there be an accurate assessment of the costs and benefits of alternative projects. It has long been known that the reinvestment rate assumption can cause differences in the ordering of projects ranked by net present value as opposed to internal rate of return calculations. A proposal is examined for reconciling the two methods and shows that the size of the chosen reinvestment rate is relatively unimportant. A common reinvestment rate can be assumed for all projects which can then be ranked according to their true rates of profit. Relatively large errors in the assumed reinvestment rate will be of little concern. (Murphy-Rutgers)
W70-10186

NOTE ON THE CHOICE OF INTEREST RATES IN COST-BENEFIT ANALYSIS,
London School of Economics and Political Science (England).
J. A. Walters.
Economica Vol XXXVII, No 145, p 78-80, February 1970.

Descriptors: *Discount rate, *Rate of interest, Economic evaluation, *Cost-benefit analysis, Decision-making, Planning, Optimization, Income, Maximization, Prices, Cost, Government.
Identifiers: *Long-term rate, *Short-term rate, Programming, *Rate of return, Securities.

Cost-benefit analysis is widely used to evaluate investments in the water resources field. This article deals with the necessary problem of choosing a discount rate when using this method of analysis. There is no accepted opinion on the appropriate interest rate to be used; some analysts prefer the long term rate, others the short rate. The author shows that there is a straight forward theoretical programming solution to the problem. It involves the comparison of the rate return on the investment with an investment in government securities. (Murphy-Rutgers)
W70-10193

AN AGGREGATE HOMOTHETIC PRODUCTION FUNCTION,
Maryland Univ., College Park.
Raul A. Meyer.
The Southern Economic Journal, Vol XXXVI, No 3, p 229-238, January 1970.

Descriptors: *Returns to scale, *Economic efficiency, Costs, Mathematical study, Prices, Total costs, Average cost, Statistics, Regression analysis, Capital, Labor, Correlation, Wages, Income, Economic evaluation.
Identifiers: *Homothetic production function, Elasticity of substitution, *Cost minimization, Homogeneity, Isoquants.

A homothetic production function is compared with the Cobb-Douglas (C-D) and constant elasticity of substitution (C E S) type of production functions. It is usually assumed, in water utility studies, that constant returns to scale exist and the C-D and C E S production functions are the type most often estimated. This author calls into question the assumptions implied in several production functions concerning returns to scale and the elasticity of substitution. He demonstrates that the assumptions of a homothetic production function are less restrictive than those of the C-D and C E S functions since the latter are a special case of a homothetic function. The author concludes that since the extra cost of estimating a general homothetic function is often quite small, the data rather than a priori assumptions should be allowed to determine the value of important parameters. Thus, this production function may be used to more accurately describe the production relations in the water resources area. (Murphy-Rutgers)
W70-10203

MUNICIPAL UTILITY BOND FINANCING,
Felicity A. Bray.
Journal of the American Water Works Association, Vol 62, No 8, p 468-472, August 1970.

Descriptors: *Financing, *Economics, Planning, Water resources development, Public utilities, Investment, Costs.
Identifiers: *Bond issue, *Revenue bonds, General obligation bonds, Prospectus.

Revenue producing utilities which are municipally owned and run usually depend on interest bearing bonds for the funding of capital improvements. The financial arrangements must correspond to the type of utility and its expected life. Various financial arrangements are discussed. The role of the engineering consultant in estimating the cost and feasibility of capital improvements is discussed. Factors affecting interest rates of bonds are presented. The function of the financial consultant in minimizing interest rates and in the preparation of the bond issue is explained. The provisions and covenants of revenue bonds which make them attractive and safe for the investor are discussed. Pitfalls of revenue bond financing are mentioned, and the importance of good financial counsel in avoiding them is stated. The bond prospectus is a very important document in a sound financing program. The requirements of a good prospectus are enumerated. The effectiveness of the prospectus and a credit rating service in increasing the number of potential investors is demonstrated. (Hewett-Rutgers)

6D. Water Demand

LINEAR PROGRAMMING MODELS FOR ESTIMATING THE AGRICULTURAL DEMAND FUNCTION FOR IMPORTED WATER IN THE PECOS RIVER BASIN,
New Mexico Univ., Albuquerque.
Micha Gisser.
Water Resources Research, Vol 6, No 4, p 1025-1032, August 1970. 8 p, 1 fig, 4 tab, 13 ref.

Descriptors: *Water demand, *Inter-basin transfers, Texas, *Mathematical models, *Linear programming, Irrigation water, Water costs, Economics, Sprinkler irrigation, Demand, Parametric hydrology, Water supply, New Mexico.
Identifiers: Agricultural water demand, Pecos River Basin.

Parametric linear programing methods were used to estimate the agricultural demand function for imported water in the Pecos basin. A parametric linear programming model suitable for the Pecos basin was developed. Agricultural activities in which land is irrigated either by local or imported water and by either ditch or sprinkler irrigation were developed and adjusted for forecasted 1980 prices. These agricultural activities were used by the parametric linear programing mode, and various agricultural demand functions were obtained for the Pecos basin. These functions show the expected quantitites of imported irrigation water that would be demanded at different prices and under a variety of constraints. (Knapp-USGS)

WATER RESOURCES PROBLEMS: PRESENT AND FUTURE REQUIREMENTS FOR LIFE,
H. C. Pereira.
In: Use and Conservation of the Biosphere, p 71-85, Unesco, Paris, 1969.

Descriptors: *Hydrologic cycle, *Planning, *Water quality, *Watersheds (Basins), Nuclear energy, Nuclear powerplants, Irrigation effects, Arid lands, Semiarid climates, Tropical regions, Saline water systems, Saline water-freshwater interfaces, Runoff, Precipitation (Atmoshperic), Erosion, Vegetation effects, Groundwater, Surface waters, Rivers, Dams, Evaporation, Water storage.
Identifiers: *World water problems, *Water quantity.

The hydrologic cycle is described as a closed, balanced system characterized by circulating water whose major source and sink are the oceans. The primary equations describing the hydrologic cycle cannot be altered, but equilibria can and are, primarily by man's intervention. Disturbances at any level create perturbations at many other levels, and water projects must therefore be carefully and rationally planned. Man must plan not only in terms of quantity but also the quality of water related to specific needs, and this must be augmented by data collection, technical training and land-use planning concomitant with the hydrologic possibilities of a given area. Problems of vegetation manipulation, surface storage development, groundwater storage and maintenance and improvement of quality are described for a variety of climates and specific areas. Recent alleviating technological innovations are also considered in detail. The special problems of high-rainfall and arid areas are extensively described and it is felt that man's environmental misuse may be measured by soil erosion in arid areas and by water pollution in wet climates. Major conclusions are: (1) River basins, and sometimes groundwater basins are the fundamental units of water resources development; (2) River basin studies should recruit a variety of disciplines--not merely engineers. (Casey-Arizona)
W70-10312

6E. Water Law and Institutions

FUGETT V STATE (CONSTITUTIONALITY OF COMMERCIAL FISHING REGULATION).

188 SW2d 641-643 (Ark 1945).

Descriptors: *Arkansas, *Commercial fishing, *Regulation, *Legislation, Fish conservation, Fish, Fishing, Sport fishing, State governments, Governments, Wildlife, Judicial decisions, Legal aspects, Adjudication procedure, Natural resources, Conservation.
Identifiers: *Constitutionality.

Appellant commercial fisherman was convicted of violating a state law which required commercial fisherman to throw back undersized fish but contained no such restrictions on other fishermen. Appellant contended that the law unconstitutionally discriminated against him since other fishermen could take small fish for their own consumption while he could not because of his occupation. Affirming the conviction, the court held that, since fish and other game are the property of the state, they are subject to state regulation. The wisdom and manner of such regulation is for the legislature, not the courts. If the legislature decides a particular conservation measure is necessary to protect the state's resources, the court will not strike down that measure unless it clearly contravenes the constitution. (Liptak-Florida)
W70-10072

JOHNSON V SOWELL (DAMAGE MEASURE WHERE SAND AND GRAVEL BASIN OVERFLOWS ONTO ADJOINING FARMLAND).

15 So 2d 688-689 (Miss 1944).

Descriptors: *Mississippi, *Overflow, *Damages, *Submergence, Flooding, Farms, Farm ponds, Pastures, Compensation, Judicial decisions, Legal aspects, Sands, Gravels, Leases, Weeds, Mosquitoes, Value, Impoundments, Excavation, Impounded waters.

Defendants, holders of a sand and gravel lease on lands adjacent to plaintiff's farm, impounded waters on the leased land for use in the sand and gravel process. This basin overflowed, submerging an acre and a half of plaintiff's pasture land. In plaintiff's suit for damages, she sought compensation for: (1) the destruction of a small pond on her land; (2) sand and gravel wrongfully taken from her land by defendants; (3) the full value of the submerged land; and (4) mosquito infestation caused by the weeds fringing defendant's intruding impoundment. The lower court awarded plaintiff the total sum of $800, and the Supreme Court of Mississippi affirmed on condition of remittitur. The court noted that full-value recovery could not be had for the submerged land since the land would regain its original value when the gravel operation ultimately ceased. Also, there could be no recovery for mosquito damage since defendants could reasonably impound waters on their premises even though the mosquito population would thereby be increased. The mere fact that the impoundment extended onto plaintiff's land did not make plaintiff more susceptible to mosquito damage than she would have been had the impoundment remained on defendant's land. (Marsee-Florida)
W70-10115

THE LONG COUNT ON DEMPSEY: NO FINAL DECISION IN WATER RIGHT ADJUDICATION,
Montana State Univ., Bozeman. Water Resources Research Center.
Albert W. Stone.
Montana Law Review, Volume 31, No. 1, Fall 1969. 27 p. OWRR Project A-031-MONT (1).

Descriptors: *Water law, *Water rights, Legislation, Montana.
Identifiers: Adjudication, Water code.

This review brings up to date the chronicle of litigation on Dempsey Creek, a small stream of less than twenty miles in length: fourteen lawsuits with eight decisions by the Montana Supreme Court. In nearly every one of these lawsuits, all or substantially all of the people in the community of Dempsey Creek were litigants. There seems little risk in predicting that the past is but a prelude to continuing and endless litigation in the future. This history of unending litigation among neighbors on a small watershed speaks for itself on the futility of Montana's present system of stream adjudication. A complete overhaul of the law was introduced in the last legislative session as part of House Bill No. 337, but failed passage. Such legislation would be a great boon to Montana and to all persons who deserve a secure and definite priority without endless lawsuits.
W70-10124

IN RE GILLESPIE (CITY'S ACQUISITION OF WATER RIGHTS BY CONDEMNATION).

272 NY 18, 3 NE2d 618-620 (1936).

Descriptors: *New York, *Water supply, *Eminent domain, *Riparian rights, Streamflow, Water rights, Public rights, Riparian land, Railroads, Streams, Natural flow doctrine, Flooding, Water injury, Condemnation, Alteration of flow, Legal aspects, Judicial decisions, Water law, Municipal water, Water sources, Cities, Local governments, Tunnels, Legislation.

Plaintiff New York City Board of Water Supply petitioned for condemnation of water rights in a stream appurtenant to defendant railroad's property. Plaintiff sought the right to increase or decrease the normal flow of the stream as necessary for the city's water supply. Defendant contended that the petition was improper since plaintiff failed to comply with state law providing for negotiations with railroads prior to condemnation proceedings. Moreover, any increase in the stream's flow during high water would cause flooding and damage to defendant's land. Reversing a judgment for defendant, the Court of Appeals of New York held that the negotiation statute permitted, but did not compel, plaintiff to negotiate before bringing a condemnation petition. The court further noted that the acquisition of the right to increase or decrease the normal flow of the stream did not contemplate abnormal or flood conditions, and plaintiff could acquire no such right to cause damage to defendant's land. (Liptak-Florida)
W70-10136

STEINLE V CITY OF CINCINNATI (CITY'S LIABILITY FOR SUBSIDENCE DAMAGE CAUSED BY LEAKING SEWERS).
142 Ohio St 550, 53 NE2d 800-803 (1944).

Descriptors: *Ohio, *Subsidence, *Settlement (Structural), *Sewers, Drainage water, Judicial decisions, Adjudication procedure, Legal aspects, Condemnation, Eminent domain, Compensation, Land tenure, Real property, Cities, Municipal water, Local governments, Waste water disposal, Damages, Leakage.

Plaintiff property owner sought damage for a taking of her property resulting from defendant city's negligent maintenance of its sewer system. The alleged negligence had allowed sewage water to escape onto plaintiff's land causing subsidence of plaintiff's house. Plaintiff contended that the intrusion of the water was a temporary appropriation of her property for public use. Defendant argued that plaintiff had purchased the property after the damage had occurred and therefore was not the proper party to bring the action. Affirming a judgment for defendant, the court noted that although plaintiff attempted to introduce an assignment of the claim from the former owner, the evidence did not appear until after plaintiff began her action. Therefore, at the time of the institution of the action, she was not the real party in interest. (Liptak-Florida)
W70-10138

PEOPLE V STATE TAX COMM'N (FRANCHISE ASSESSMENT OF RAILROAD CROSSINGS OVER NAVIGABLE STREAMS).
29 NE2d 932-933 (NY 1940).

Descriptors: *New York, *Railroads, *Bridges, *Assessments, Transportation, Streams, Navigable waters, Ownership of beds, Judicial decisions, Adjudication procedure, Legal aspects, Taxes, Evaluation, State governments, Administrative decisions, Administrative agencies.

Plaintiff railroad sought to review defendant tax commission's franchise assessment of three bridges or trestles which crossed certain creeks. Plaintiff contended that the assessments were illegal because: it owned the submerged bottom under the crossings, the crossings were not over navigable water, and the crossings were less than 250 feet in length. The Court of Appeals of New York affirmed per curiam the lower appellate court's decision in favor of defendant. The lower court had affirmed the assessments on the ground that the creeks were public navigable waters and the crossings were all over 250 feet in length. (Liptak-Florida)
W70-10140

STATE V CITY OF CLEARWATER (MUNICIPAL OPERATION OF YACHT BASIN).
184 So 790-797 (Fla 1938).

Descriptors: *Florida, *Cities, *Docks, *Engineering structures, Piers, Judicial decisions, Legal aspects, Coastal structures, Marinas, Construction, Maintenance, Channels, Breakwaters, City planning, Water resources development, Operation and maintenance.
Identifiers: *Yacht basins.

Petitioner municipality, in an attempt to construct, operate and maintain a yacht basin, passed an ordinance authorizing such activity and then petitioned the court for validation and confirmation of the issue of yacht basin revenue certificates. The state's attorney challenged the authority of petitioner to construct, operate and maintain a yacht basin. The Supreme Court of Florida affirmed a circuit court decision validating the issue of the revenue certificates. The court concluded that the Florida statute authorizing petitioner to construct, maintain and operate wharves, ship channels breakwaters and other facilities authorized such city to construct, operate and maintain a yacht basin. (Powell-Florida)
W70-10162

SKRMETTA V ALABAMA OYSTER COMM (REGULATION OF OYSTER TAKING TO CONSERVE STATE PROPERTY).

168 So 167-170 (Ala 1936).

Descriptors: *Alabama, *Conservation, *Regulation, *Public benefits, Navigation, Ownership of beds, Legislation, Judicial decisions, Legal aspects, Public rights, Relative rights, State governments, State jurisdiction, Watercourses (Legal), Fish conservation, Wildlife conservation, Adoption of practices, Economics, Preservation, River regulation, Fish management, Inspection, Administrative agencies, Supervisory control (Power).

Defendant oyster commission passed a regulation forbidding the taking of oysters by dredging on all public reefs and state-owned bottoms in Alabama waters. Plaintiff contended the establishment of the commission was an unconstitutional delegation of legislative authority and sought to enjoin the application of the regulation. The court stated that the state owns the absolute property in the oyster bed and oysters in her navigable waters, holding it in trust and for the use of her people, subject only to the paramount right of navigation. The power and duty of the state to protect such interests of the public by regulation is not subject to reasonable debate. The regulation challenged was valid as its purpose was to conserve state property, and the powers and purposes of the oyster commission were sufficiently specific. The judgment denying plaintiff an injunction was affirmed. (Price-Florida)
W70-10164

GREAT LAKES PORTS FACE FORMIDABLE CHALLENGES,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
Harry C. Brockel.
Seaway Review, Vol 1, No 1, p 5-8, 26, Spring 1970. 1 fig.

Descriptors: *Navigation, Ships, Harbors, Canals, Locks, *St. Lawrence Seaway, Great Lakes.
Identifiers: Welland Canal, Lash Ships.

The role of the St. Lawrence Seaway has already begun to change. The new ship building and port technologies, as well as changing economic conditions, have affected the commerce potentialities of the Seaway Corporation. Although both the Canadian and U.S. governments have insisted that the operational costs of the seaway be met by tolls, the U.S. government has not used many of its indirect powers to encourage seaway use. For instance, the Defense Department has avoided the use of lake ports and U.S. rail rate structures discriminate against fresh water gateways. The author concludes that unless lake ports are modernized they will become primarily ports for gathering ship

which will meet transoceanic container liners at Montreal to transport commerce back and forth to the lake ports. (Holmes-Rutgers)
W70-10176

STATE GAME AND FISH COMMISSION V LOUIS FRITZ CO (REMOVAL OF ROUGH FISH).

193 So 9-18 (Miss 1940).

Descriptors: *Mississippi, *Fish, *Fish management, *Fish conservation, Judicial decisions, Legal aspects, Water conservation, Lakes, Carp, Riparian rights, Water policy, Turtles, Nets, Administrative agencies, Supervisory control (Power), Regulation, Rough fish.
Identifiers: *Non-game fish.

Plaintiff was the owner of more than nine-tenths of the shoreline of an inland, freshwater, non-tidal natural lake. Defendant Game and Fish Commission executed a contract to remove non-game gross fish from said lake. Plaintiff obtained a temporary injunction enjoining defendants from seining the lake and removing such fish. The Supreme Court of Mississippi held that plaintiff was not entitled to recover from defendant or its members the value of the fish taken from the lake. The injunction was allowed to stand since the members of the court were equally divided on that question. Separate opinions of the justices were presented. (Powell-Florida)
W70-10178

WOODBURY V MUNICIPAL COUNCIL OF GLOUCESTER (ARBITRARY REVOCATION OF FISH-TRAP PERMIT).

61 NE2d 647-650 (Mass 1945).

Descriptors: *Massachusetts, *Fishing gear, *Permits, *Regulation, Judicial decisions, Legal aspects, Cities, Local governments, Commercial fishing, Fishing, Nets, Trapping, Governments, Bays, Oceans, Tidal waters, Navigable waters, Federal government.

Plaintiff fisherman sought review of defendant town's revocation of plaintiff's license to maintain a fish trap. Plaintiff contended that the revocation was arbitrary in that defendant's intent was to grant a license to someone else to maintain a trap at the same location. Defendant argued that plaintiff's license was improperly granted since plaintiff's predecessor's license was still outstanding when plaintiff acquired his license. Quashing the town council's revocation order, the court held that even though the right to maintain a structure in navigable waters is merely a revocable privilege, the revocation cannot be based on arbitrary or capricious grounds. Further, the court noted that plaintiff's predecessor had the right to surrender his license before it expired, which he did, making the grant of plaintiff's license perfectly valid. (Liptak-Florida)
W70-10180

DEL BALSO HOLDING CORP V MCKENZIE (RENT AS PREREQUISITE TO EXERCISE OF RIPARIAN RIGHT TO ACCESS BY PIER).
271 NY 313, 3 NE2d 438 (1936).

Descriptors: *New York, *Riparian rights, *Piers, *Permits, Riparian waters, Navigable waters, Banks, Riparian land, Landfills, Public rights, Legal aspects, Ownership of beds, Usufructuary right, Water law, Judicial decisions, Adjudication procedure, Access routes, Right-of-way, Administrative agencies, Regulation, Local governments, Cities, Land tenure, Real property, Rent.

Plaintiff riparian owner applied for a writ of mandamus to compel defendant Commissioner of Docks of New York City to issue a permit for the construction of a pier on a creek. Plaintiff contended that, as a riparian owner, he had a right of access by means of a pier to navigable water fronting his upland. However, defendant sought to collect rent for the erection and maintenance of the pier. Defendant contended that plaintiff was not a riparian owner but that he had illegally filled the land in question, which actually belonged to the city. Consequently, defendant contended that it could charge plaintiff rent to enter the land and build a pier. On plaintiff's appeal, the court noted that each party was correct as to the law pertaining to his own version of the facts. The case was remanded for a determination of the facts. (Liptak-Florida)
W70-10182

IN RE PUBLIC BEACH, BOROUGH OF QUEENS, CITY OF NEW YORK (CONDEMNATION VALUE OF WATERFRONT PROPERTY BURDENED WITH EASEMENT).
269 NY 64, 199 NE 5-10 (1935).

Descriptors: *New York, *Condemnation, *Easements, *Condemnation value, Eminent domain, Beaches, Judicial decisions, Legal aspects, Right-of-way, Cities, Public benefits, Value, Evaluation, Land use, Compensation, Local governments, Governments, Recreation, Swimming, Recreation facilities, Damages.
Identifiers: Servitudes.

Appellee city brought condemnation proceedings to acquire land for the purpose of establishing a public beach or park. The parcel of land involved was a strip of waterfront property owned by the appellant property association. The association owned the waterfront property subject to an easement in favor of all owners of all lots on a designated map to use and enjoy the beach for bathing and other recreation and sport. For the purpose of maintaining the association's property as a private beach, appellant association received membership fees from the property owners. The association appealed a judgment awarding nominal damages in the condemnation proceeding. The Court of Appeals held that the association was entitled to more than nominal damages since ownership and right of beneficial enjoyment were vested in the appellants. The court stated that the ultimate question in condemnation proceedings is not whether land taken is burdened by servitude, but rather the value of land for any use consistent with the burden on it. (Powell-Florida)
W70-10183

NATIONAL CELLULOSE CORP V STATE (STATE'S LIABILITY FOR APPOPRIATION OF PAPER COMPANY'S WATER RIGHTS).

292 NY 438, 55 NE2d 492-496 (1944).

Descriptors: *Damages, *New York, *Appropriation, *Pulp and paper industry, Canals, Dams, Riparian rights, Riparian waters, Riparian land, Natural flow doctrine, Streamflow, Judicial decisions, Legal aspects, Compensation, State governments, Natural streams, Competing uses, Navigable waters, Preferences (Water rights), Hydraulic machinery, Reservoirs, Channel improvement, Locks, Powerplants.

Plaintiff paper products company brought an action against defendant State of New York to recover loss of profits and the cost of converting from water power to electric power. The loss allegedly resulted from defendant's improvement of a dam for use in connection with a barge canal. Plantiff contended that, after the improvements, defendant used more water than it was entitled to, with the result that at various times there was insufficient water flow to operate plaintiff's plant. This caused plaintiff to lose business and to convert its plant to electric power. Defendant argued that the damages should be limited to the value of the water of which plaintiff was deprived. Affirming a judgment for plaintiff, the Court of Appeals of New York held that plaintiff was entitled to recover all elements of damage that necessarily resulted from defendant's interference with plaintiff's riparian rights. (Liptak-Florida)
W70-10211

RYDER V TOWN OF LEXINGTON (CITY'S LIABILITY FOR WATER DAMAGE CAUSED BY DRAINAGE WATER OVERLOAD OF STREAM).
21 NE2d 382-390 (Mass 1939).

Descriptors: *Massachusetts, *Water injury, *Surface drainage, *Drains, Drainage systems, Drainage water, Surface waters, Surface runoff, Streams, Tile drains, Natural flow doctrine, Flood damage, Prescriptive rights, Judicial decisions, Legal aspects, Water law, Riparian land, Culverts, Cities, Local governments, Adjudication procedure, Drainage effects, Riddance (Legal aspects), Excess water (Soils), Outlet works.

Plaintiff landowners brought an action against defendant town to recover for damage to their land. The damage was allegedly caused by defendant's construction of drains which discharged more surface water into a stream than the stream could handle, thereby flooding plaintiff's land and interfering with the natural drainage of the land. Plaintiffs contended that the discharge of water into the creek without any improvement in the creek's capacity, or in the size of the culvert downstream from plaintiff's property, constituted a trespass on their land. Defendant argued that the drains were installed by public officers for whose acts the town could not be liable and that the town had acquired a prescriptive right to flood the property since the flooding had continued for five years. Affirming a judgment for plaintiff, the court held that the officers who supervised the drain construction were acting as the town's agents, for whose actions the defendant could be liable. The court held further that no prescriptive right to inflict damage on another's land arises from the improper maintenance of a drainage system. (Liptak-Florida)
W70-10214

HAMRICK V CITY OF ALBERTVILLE (CITY'S LIABILITY FOR FLOODING CAUSED BY ROAD IMPROVEMENT).
189 So 545 (Ala 1939).

Descriptors: *Alabama, *Cities, *Road construction, *Flooding, Adjudication procedure, Judicial decisions, Roads, Maintenance, Legal aspects.

Complainant sought to enjoin the taking of his land or, in the alternative, to recover damages for trespass to--and flooding of--the land. The flooding was alleged to have resulted from respondent city's straightening of a road. The Supreme Court of Alabama held that the complainant had not met the burden of proof of establishing the acts alleged. Moreover, the weight of the evidence showed that complainant had for a long time acquiesced in the road work, and complainant's land was in reality enhanced in value by the improvements. (Marsee-Florida)
W70-10217

CITY OF SHREVEPORT V CASE (ULTRA VIRES REGULATION OF MOTOR CRAFT ON LAKE)
198 La 702, 4 So 2d 801-804 (1941).

Descriptors: *Louisiana, *Lakes, *Public benefits, *Boating regulations, Cities, Navigable waters, Ownership of beds, Legislation, Local governments, Water demand, Water supply, Water conservation, River regulation, Pollution, Public health, Pollution abatement, Legal aspects, Judicial decisions, Public rights, Relative rights, Water policy, Supervisory control (Power).

Plaintiff city unsuccessfully attempted to prosecute defendant for operating a motor boat on Cross Lake without a muffler in violation of a city ordinance. Defendant contended the city had been granted authority to pass ordinances affecting the lake only for the purpose of protecting the water supply from pollution and contamination. The city

contended that its power over the lake was plenary. The court ruled that the power granted was clearly meant to be limited to protecting the lake from pollution, and not to be construed as a more general police power. Regulations pertaining to the operation of motor boats without mufflers have no relation to the prevention of pollution and contamination. The ordinance in question was therefore void since it was passed without proper authority. The judgment for defendant was affirmed. (Price-Florida)
W70-10285

EX PARTE GUTHRIE (CITY'S CHARTER POWER TO REGULATE FISHING).
2 So 2d 121 (Fla 1941).

Descriptors: *Florida, *Cities, *Supervisory control (Power), *Fishing, Fish conservation, Judicial decisions, Legal aspects, Regulation, Legislation.

The city charter of Sarasota, Florida granted the city--for municipal purposes only--powers over and title to tidewater and other lands, river and bay bottoms, waters, waterways and water bottoms. Under the charter the city sought to regulate fishing within its boundaries. The Supreme Court of Florida hald that the case of Nash v Vaughn, 133 Fla. 499, 182 So 827, was controlling on the question of the city's authority to so regulate. A legislative grant of the power to regulate fishing did not clearly appear from the language of the charter and could not therefore be recognized. The grant of the land and waters in the charter was limited for municipal purposes and no other. (Marsee-Florida)

SKIRIOTES V STATE (CONSTITUTIONALITY OF FLORIDA'S MARINE BOUNDARY).
197 So 736-739 (Fla 1940).

Descriptors: *Florida, *State jurisdiction, *International waters, *Commercial fishing, Legal aspects, Judicial decisions, Political aspects, International law, Treaties, Legislation, Marine animals, Fishing gear.
Identifiers: *Sponge industry, *Marine boundary, Constitutionality.

Subsequent to his criminal prosecution for the illegal taking of sponges in the Gulf of Mexico, petitioner sought certiorari on appeal. Petitioner admitted taking the sponges with illegal diving apparatus in the location described, but asserted that the marine boundary of Florida was fixed by international law at one marine league (three nautical miles) from the shore, and since the offense was committed beyond this limit, Florida was without jurisdiction. The Florida 1885 constitution fixed the marine boundary at three marine leagues (nine nautical miles). Petitioner contended this provision violates the United States Constitution, federal treaties and executive orders. Moreover, petitioner contended that the act of Congress in readmitting Florida to the Union had not constituted an approval of Florida's marine boundary. The Supreme Court of Florida noted that the marine boundaries of other states extended as much as nine leagues from the shore and that these boundaries were approved by Congress in the same manner as Florida's. In denying the writ of certiorari, the court noted that any state has the right to reasonably fix its marine boundary with the approval of Congress and concluded that the long acquiesence by Congress in the boundary fixed by Florida conclusively indicated such congressional approval. (Hart-Florida)

BENSON V CITY OF ANDALUSIA (CONSTITUTIONALITY OF ORDINANCE FOR OPERATION OF CITY SEWAGE SYSTEM).

195 So 443-446 (Ala 1940).

Descriptors: *Alabama, *Sewers, *Legislation, *Cities, Municipal wastes, Public health, Urbanization, Sewage disposal, Judicial decisions, Legal aspects, Taxes, Operating costs, Payment, Regulation, Relative rights.
Identifiers: *Constitutionality.

Defendant city owned a sewer system. Pursuant to its operation, an ordinance was enacted providing for a sewer service charge commensurate with the number of connections served, a fine for failure to pay the charge, and disconnection from the system after 30 days delinquency. Plaintiff sought to have the ordinance declared invalid, contending that it was: (1) arbitrary, unreasonable, and discriminatory; (2) a taking of property without due process; (3) a tax; and (4) a denial of equal protection of the law. Affirming the lower court's decree for defendant, the court found that: (1) the complaint failed to allege facts showing that the ordinance was unreasonable and arbitrary; (2) the sewer system was municipal property and, since plaintiff had no interest therein, disconnection was not a taking without due process; (3) the charges were for special benefits for certain persons so they could not be construed a general tax; and (4) the ordinance was within the police power. (Hart-Florida)

CHAMBERLAIN V BOARD OF COMM'RS (CONSTITUTIONALITY OF PROPOSED BOND ISSUE).

11 So 2d 724-732 (Ala 1943).

Descriptors: *Alabama, *Income, *Debt, *Tunneling, Urbanization, Interest, Tunnel construction, Cities, Underground structures, Loans, Cost repayment, Judicial decisions, Legal aspects, Legislation, Rivers, Navigable rivers, River beds, Ownership of beds, Reservation doctrine, State governments.
Identifiers: *Constitutionality.

Plaintiff Board of Commissioners brought a petition in equity against defendant taxpayers and citizens of Mobile to determine the authority of the city to issue revenue bonds. Plaintiff had constructed a tunnel under the Mobile River by pledging toll revenue to secure a bond issue. The use of the toll revenue was restricted to paying interest and bond capital and tunnel maintenance. Plaintiff proposed to issue more bonds, with the proceeds to be used to redeem the prior bonds and to extend and enlarge the tunnel project. Plaintiff contended that since the new bonds would pledge revenue from the then municipally-owned tunnel, a constitutionally prohibited city debt would be established. However, the court found that since the Mobile River was navigable, the river bed and therefore the tunnel was state property which was controlled by the legislature. Since the city did not own the tunnel, and the legislature had authorized the toll use for only a specific purpose, the court held that the city was only a quasi-trustee for the toll revenue and therefore the bond issue would not create a city debt. The decision of the lower court for defendant was affirmed. (Hart-Florida)

TOWN OF FRISCO CITY V GREEN (CITY'S BURDEN OF PLEADING COMPARATIVE INJURY DOCTRINE WHERE CITY'S SEWER POLLUTES BRANCH FLOWING THROUGH DAIRY).

12 So 2d 409-410 (Ala 1943).

Descriptors: *Alabama, *Adjudication procedure, *Pollution abatement, *Dairy industry, Damages, Sewers, Sewage, Sewage disposal, Sewage effluents, Streams, Pastures, Livestock, Milk, Odor, Wet seasons, Overlfow, Judicial decisions, Legal aspects, Municipal wastes, Relative rights.
Identifiers: *Injunctions, Contamination.

Plaintiff dairyman sued defendant city seeking t abate a nuisance. Defendant's sewer discharge into a wet weather branch flowing across plaintiff dairy pasture, and in times of wet weather, th branch overflowed, spilling the polluted water over plaintiff's pasture. Plaintiff alleged that thi overflow resulted in: (1) foul odors in and aroun his nearby dwelling, (2) making the waters of th branch unfit for his herd's consumption, and (3 contaminating the pasture grasses and milk fror his cows. Defendant relied on the 'comparative ir jury doctrine', contending that plaintiff had not a alleged facts from which the court coul reasonably determine whether the granting of th injunction sought would result in a greater incor venience or hardship to the city than the plaintif would suffer by its denial. The lower court ove ruled defendant's demurrer and the Supreme Cou of Alabama affirmed, holding that 'comparative ir jury' was a defense and placed the burden of proc on the defendant. Plaintiff had no burden in hi pleadings of raising or anticipating such defens (Marsee-Florida)

DOUCET V TEXAS CO (RELATIVE RIGHTS OF MINERAL LESSEES AND OYSTER LESSEES).
205 La 312, 17 So 2d 340-349 (1944).

Descriptors: *Louisiana, *Leases, *Oysters, *Oil wastes, Pollution, Effluents, Sponges, Clams, Hydrogen sulfide, Chemical wastes, Gases, Fuels, Diseases, State governments, Legislation, Relative rights, Judicial decisions, Legal aspects, Oil water, Pollutants.

Plaintiff sued defendant corporation in damages for the value of oysters allegedly killed in beds leased by plaintiff from the state as a result of defendants' pollution of the waters over said beds by its oil operations. Defendant denied liability and contended it was operating under a lease from the state and that its operations were conducted under the best conditions and in accord with approved methods. Defendant also contended plaintiff had failed to prove the proximate cause of the death of the oysters. The court said it was never the intention of the legislature to give to mineral lessees the right to operate in such a manner as to pollute the waters in utter disregard for the rights of oyster lessees. Based on expert testimony relating to extensive experimentation as to the cause of death of the oysters, the court concluded the pollution of the waters with oil and other effluents discharged therein by defendant company was the proximate cause of the death of plaintiff's oysters. The judgment in favor of defendant was reversed. (Price-Florida)

ALEXANDER V CITY OF SHREVEPORT (EROSION OF PROPERTY BY WATER FLOWING FROM CITY CULVERT).

205 La 480, 17 So 2d 716-719 (1944).

Descriptors: *Louisiana, *Ditches, *Accelerated erosion, *Diversion, Superimposed drainage, Drainage effects, Drainage practices, Drainage water, Soil conservation, Storm drains, Cities, Urbanization, Culverts, Erosion, Soil erosion, Damages, Judicial decisions, Legal aspects, Adjudication procedure, Cities, Water injury, Drainage programs, Watersheds (Basins), Small watersheds, Natural flow doctrine.

Plaintiff landowner sought injunction to prohibit defendant city from permitting surface water to flow over his land and also sought damages for injury therefrom. Plaintiff owned several lots upon which a small ditch was dug. Water from a municipal culvert draining a 40 acre watershed flowed through this ditch onto plaintiff's land, causing severe erosion. Plaintiff contended that defendant dug the ditch, and that defendant had diverted water over his property. The Supreme Court affirmed the trial court's judgment for defendant, holding that plaintiff had failed to prove either of these contentions. The court also rejected plaintiff's assertion of res ipsa loquitur since defendant did not have exclusive control of plaintiff's property. (Hart-Florida)
W70-10358

EMERY V ORLEANS LEVEE BD (DEDICATION OF STATE PROPERTY VIA ACT AUTHORIZING PROJECT CONSTRUCTION).
207 La 386, 21 So 2d 418-424 (1945).

Descriptors: *Louisiana, *Levees, *Spillways, *Condemnation, Floods, Flood control, Flooding, Floodproofing, Flood protection, Floodwater, Floodways, Legislation, Mississippi River, Condemnation value, Compensation, State governments, Eminent domain, Public benefits.

The state legislature authorized the construction of a spillway for flood protection purposes in 1924 and authorized the taking of certain lands for that purpose. In 1938, after the completion of the spillway, plaintiffs obtained a certificate of redemption from the state which they claimed title to part of the land under the spillway. Defendant levee board contended that since at the time of the act authorizing the building of the project, the land was then owned by the state, it was dedicated thereby for public use. The court held for defendant stating that at the time of the authorization of the spillway construction, the land in dispute was effectively taken out of commerce and thereafter remained in the ownership of the state. (Price-Florida)

EVANS V DUGAN (PRIVATE USE OF STATE-OWNED SHORE).
205 La 398, 17 So2d 562-566 (1944).

Descriptors: *Louisiana, *Relative rights, *Lake shores, *Public benefits, Riparian rights, Riparian waters, Riparian land, Navigable waters, Shores, Lakes, High water mark, Public rights, Spillways, Dams, Impounded waters, State governments, Impoundments, Recreation, Legal aspects, Judicial decisions, Legislation.

Plaintiff owned property fronting on the shore of a lake. The shore was state property and under the control of a state agency. Defendant owned and operated a fishing camp on said shore. Plaintiff sought to have defendant's residence and camp removed as a nuisance, and contended defendant had appropriated state property for his private use. Defendant contended he was granted permission by the state agency in charge to build and operate such camp as it was deemed to be in the best interest of the general public. Based on the evidence in the record, the court found that defendant was not a trespasser and that the camp operated by him in no way constituted a nuisance but rather was a public convenience. Operation of the camp by defendant did not deprive plaintiff of the free use of the lake shore, and he was not hampered in any way in his rights of fishing, boating, landing or traveling on or along the lake shore. Plaintiff had no right to demand the ejectment of defendant from said shore. The judgment for defendant was affirmed. (Price-Florida)
W70-10413

FILTROL CORP V HUGHES (REASONABLE USE OF LAND AFFECTING SURFACE RUNOFF).
23 So 2d 891-892 (Miss 1945).

Descriptors: *Mississippi, *Surface runoff, *Rainwater, *Reasonable use, Judicial decisions, Legal aspects, Water rights, Overland flow, Surface drainage, Surface waters, Topsoil, Mining, Excavation, Earthworks, Excess water (Soils), Gravitational water, Relative rights, Discharge (Water), Damages.

Plaintiff and defendants were adjoining landowners. Surface water naturally flowed from defendants' land onto plaintiff's land. Defendants were engaged in the removal of clay containing bentonite, and rain water collected in the resulting excavation. Defendants discharged such collected surface water in a body which resulted in damage to plaintiff's land. The Supreme Court of Mississippi affirmed the trial court's judgment of damages for plaintiff and determined that although defendants had the right to make reasonable use of their land without liability to the plaintiff for any unavoidable injury caused him as a result of an incident thereto, defendants did not have the right to cause surface water to be collected and discharged in a body onto plaintiff's land so as to abnormally affect such land. UNITED STATES V MEYER (DISCRETION IN EXERCISE OF EMINENT DOMAIN AND DAMAGE ARISING THEREFROM).
113 F2d 387-398 (7th Cir 1940).

Descriptors: *United States, *Condemnation, *Eminent domain, *Damages, Condemnation value, Easements, Legal aspects, Compensation, Dams, Dam construction, Damsites, Mississippi River, Illinois, Rivers and Harbors Act, Legislation, Subsurface drainage, High water mark, Riparian rights, Relative rights, Governments, Navigation, Boundaries (Property), Judicial decisions, Administration decisions.

In a condemnation action brought by the United States, defendants' land was taken in fee pursuant to a plan to construct a dam on the Mississippi River. Defendants had cross-claimed to prohibit the taking and also to recover for alleged damage to the subsurface drainage of lands not taken. The taking in fee was challenged as unnecessary and as an abuse of discretion by the Secretary of War. The Seventh Circuit Court of Appeals ruled that the Secretary was authorized by Congress to decide the extent of the exercise of eminent domain practices, and unless an abuse of discretion could be proved, the decision was not reviewable. The court further ruled that the alleged damage to the subsurface drainage was not a taking within the meaning of the fifth amendment but was caused by raising the water level to the ordinary high water mark, which was authorized by the power of the government over navigable waters. The taking in fee and the award of the district court were affirmed. (Barker-Florida)
W70-10423

WASHINGTON WATER POWER CO V UNITED STATES (EVALUATION OF RIPARIAN LAND IN CONDEMNATION SUIT BY UNITED STATES).
135 F2d 541-543 (9th Cir 1943).

Descriptors: *Washington, *Compensation, *Condemnation value, *Condemnation, Eminent domain, Federal government, Judicial decisions, Legal aspects, Land tenure, Local governments, Ownership of beds, Preferences (Water rights), Public benefits, Relative rights, Riparian land, Water rights, Watercourses (Legal), Value, Market value, Property values, Appraisals, Assessments, Evaluation, Land appraisals.

Plaintiff United States had condemned certain riparian land belonging to defendant power company, and compensation therefor was established. Defendant contended a greater compensation should be paid as the property was adaptable for power-site purposes. Plaintiff contended that while such a use was possible under some circumstances, it could not here be exercised. The court, in holding for plaintiff, stated that a riparian owner has no property right in the bed of a stream or to the use of

the water or the power inherent therein as against the United States, and therefore such riparian owner may not recover for the potential power-site value of the riparian lands. (Price-Florida)

IN RE EAST RIVER DRIVE (NO TITLE PASSES TO UNDERWATER LANDS RESERVED FOR PUBLIC STREETS).
159 Misc 741, 289 NYS 433-458 (Sup Ct 1936).

Descriptors: *New York, *Grants, *Ownership of beds, *Road construction, Underwater, Cities, Land, Land use, Management, Land development, Roads, Public lands, Construction, Easements, Judicial decisions, Legal aspects, Condemnation, Access routes, Local governments.
Identifiers: *Underwater lands, *Adverse possession (Legal aspects).

Defendant city gave a series of grants of underwater lands to plaintiffs' predecessors in interest. However, defendant reserved the right to use all or part of these underwater lands for public streets. Up to the time of the condemnation proceeding brought by defendant, no streets had been constructed under the terms of the grants. Plaintiffs claimed title to these underwater lands on the ground that the reservation as stipulated in the original grants was never effectuated and was, therefore, meaningless. Plaintiffs also contended that they held title by adverse possession by virtue of an easement of access and egress over such reserved lands. The court denied plaintiffs' claim of title by adverse possession, as plaintiffs' easement could not ripen into fee title by adverse possession. The court found title to be in defendant, and stated that even though streets were never constructed on the underwater lands, according to defendant's right under the terms of the grants, this did not alter the terms of the grants nor nullify the reservation imposed by such grants. RUSSELL AND CO V PUERTO RICO (IMPAIRMENT OF CONTRACT FOR WATER RIGHTS).

118 F2d 225-231 (1st Cir 1941).

Descriptors: *Puerto Rico, *Contracts, *Taxes, *Irrigation districts, Administrative decisions, Appropriation, Community development, Condemnation, Eminent domain, Judicial decisions, Legal aspects, Legislation, Preferences (Water rights), Public benefits, Relative rights, Riparian land, Riparian rights, Riparian waters, Water transfer, Irrigation, Water rights, Usufructuary right.

Plaintiff Puerto Rico had been authorized by act of the Puerto Rican legislature to construct and maintain an irrigation district using the water of the Jacaguas River. Plaintiff had also been given the authority to condemn the water rights of all users not located within the district. This arrangement was unacceptable to the users, however, because they needed the water to grow their crops. In lieu of purchasing their water rights, plaintiff entered into a contract with defendants in which plaintiff promised to deliver to each of them an amount of water equivalent to their water right in consideration for which defendants would relinquish said water rights. Later the legislature passed a bill taxing all users of irrigation water on a per acre basis, defendants included. When defendants refused to pay, plaintiff brought this action to collect such taxes. The court held that such a tax on defendants constituted an impairment of the obligation of contract by the government. But for the contract, defendants had a right to use the waters of the river for free. They relinquished that right in consideration for the delivery of an equivalent amount of water. The governmental imposition of a tax constituted an additional condition not bargained for. (Clarke-Florida)
W70-10429

UNITED STATES V CHICAGO BURLINGTON AND QUINCY RR (RECOVERY OF DAMAGES PROXIMATELY CAUSED BY DAM CONSTRUCTION).
90 F2d 161-173 (7th Cir 1937).

Descriptors: *United States, *Mississippi River, *Condemnation value, *Dam construction, Dams, Dam design, Damsites, Sediment control, Eminent domain, Right-of-way, Damages, Railroads, Condemnation, Compensation, High water mark, Banks, Rivers, Lakes, Tributaries, Drainage patterns (Geologic), Judicial decisions, Legal aspects.

Plaintiff United States brought action to condemn a tract of land for the construction of a dam on the Mississippi River. Defendant railroad was awarded damages for the loss of its claim of ownership in the tract and was further given an award for damage which would be done to its rights-of-way, road beds, bridges, and embankments which were located above the dam site beyond the boundaries of the condemned tract. The United States appealed claiming that such damage was remote, consequential and speculative, and thus no award could be given. The Seventh Circuit Court of Appeals, affirming the district court's judgment for defendant, ruled that such damage was proximately caused by the construction of the dam. By filing the condemnation action, the United States impliedly promised to pay for the proximate damage to defendant's remaining property beyond the location of the dam. (Barker-Florida)
W70-10430

UNITED STATES V ALASKA'S PACKING CO (PROSECUTION FOR OIL POLLUTION).
84 F2d 444-446 (9th Cir 1936).

Descriptors: *Washington, *Legislation, *Oil, *Water pollution, Water pollution sources, Pollutants, Oil wastes, Oily water, Ships, Navigable waters, Lakes, Admiralty, United States, Federal government, Judicial decisions, Legal aspects, Regulation, Adjudication procedure.
Identifiers: *Oil pollution.

Plaintiff United States brought libel against defendant vessel for discharge of oil into navigable waters. Defendant contended that the wording of the statute on which the libel was based, ' (i)t shall not be lawful. . .to discharge. . .refuse matter of any kind or description whatever. . .into navigable water,' did not prohibit oil pollution. This contention was supported by the legislative history of a different act, the Oil Pollution Act. Rejecting the proposition that the legislative history of a different act than the statute in question might reveal congressional intent, the court held that the prohibition included the discharge of oil, and reversed the judgment of the lower court for defendant. (Hart-Florida)
W70-10438

REAMS V CITY OF LONDON (SUIT FOR DAMAGES TO PROPERTY CAUSED BY POLLUTION OF A STREAM).

293 Ky 473, 168 SW2d 994-996 (1943).

Descriptors: *Kentucky, *Water pollution, *Sewage effluents, *Treatment facilities, Structures, Cities, Water pollution sources, Water pollution effects, Land use, Damages, Legal aspects, Sewage disposal, Land tenure, Adjuciation procedure, Remedies, Judicial decisions.

Plaintiff sought damages for the pollution of a stream flowing through his property. The damage was allegedly caused by a malfunction of the defendant city's sewage treatment plant. Plaintiff alleged that the damage was caused by the construction of a permanent structure, and that he should be able to collect past and future damages in one action. The city denied these allegations, and further claimed that the pollution existed when the plaintiff purchased the property in question. At trail, the jury had rendered a verdict for the defendant. The court held that the verdict had been based either on the proposition that the city had not caused the pollution, or that the condition existed when plaintiff bought the land. As there was evidence presented which could sustain either finding, the trial court's verdict was sustained. (Caldwell-Florida)
W70-10439

STONE V CITY OF ASHLAND (CITY'S LIABILITY FOR WATER POLLUTION FROM MUNICIPAL SEWERS).
32 NE2d 560-561 (Ohio Ct App 1939).

Descriptors: *Ohio, *Water pollution, *Cities, *Sewers, Municipal wastes, Natural streams, Streams, Pollutants, Effluents, Oilywater, Sewage, Sewage effluents, Local governments, Judicial decisions, Legal aspects, Water law, Drainage water, Runoff, Drains, Sewage disposal, Adjudication procedure, Remedies, Compensation, Damages.

Plaintiff landowner brought an action against defendant city for damages caused by defendant's maintenance of its drainage and sewer system. Defendant's system had polluted the stream running through the city and onto plaintiff's property. Plaintiff contended that such maintenance of the sewers, and the city's permitting others to add to the pollution of the stream, was a nuisance, for which defendant was liable. Defendant argued that the evidence did not establish that the city had polluted the stream and, that in any event, maintenance of the sewers was a governmental function for which there could be no liability. Affirming a judgment for plaintiff, the court held that, although the decision to construct a sewer system is a governmental function, the actual maintenance and operation of the sewers is a ministerial function for which a city can be liable. The evidence clearly supported the jury's verdict. (Liptak-Florida)
W70-10440

LIVEZEY V TOWN OF BEL AIR (DUTY OF MUNICIPALITY TO OPERATE ITS SEWAGE DISPOSAL PLANT IN SUCH A WAY AS NOT TO CREATE A NUISANCE).
199 A 838-843 (Md 1938).

Descriptors: *Maryland, *Pollution abatement, *Sewage disposal, *Municipal wastes, Cities, Sewers, Condemnation, Effluents, Fishkill, Organic wastes, Waste disposal, Drainage systems, Drainage programs, Pollution abatement, Pollution identification, Pollutants, Natural flow doctrine, Sanitary engineering, Judicial decisions, Legal aspects.

Plaintiff sought to enjoin defendant city from operating its sewage disposal plant. Defendant had allegedly polluted a stream which ran through plaintiff's land. Two issues were present: did defendant pollute the stream, and was plaintiff entitled to injunctive relief. The court stated that it is the right of every riparian owner to enjoy in its natural state, in flow, quantity and quality, a natural stream running through his property. A municipality, in making its drains and sewers, is not immune from liability of it so constructs or maintains them so as to amount to a nuisance. The court ruled that the evidence was sufficient to sustain a finding that the pollution and resulting damage was caused by defendant's operation of the sewage plant, and that plaintiff was entitled to relief. Where the nuisance operates to destroy health, or impair the enjoyment of property, and no adequate remedy at law exists, injunctive relief must be granted. However, the court applied the doctrine ofalancing of equities due to the grave hardship and opportunity for disease the immediate shutdown of the disposal plant

would create, and defendant was given a reasonable time to rectify the situation. Such correction not appearing, plaintiff could reinstitute his bill. The trial court's decree for defendant was reversed. (Price-Florida)
W70-10441

THE PANAM (LIBEL FOR THE DISCHARGE OF OIL INTO COASTAL NAVIGABLE WATERS).
54 F Supp 461-462 (D NJ 1944).

Descriptors: *New Jersey, *United States, *Water pollution sources, *Oil, Water pollution, Coasts, Ships, Storms, Navigable waters, Judicial decisions, Legal aspects, Admiralty, Water pollution control, Oil wastes, Oily water, Federal jurisdiction.
Identifiers: *Oil Pollution Act.

A libel action was brought against the oil tanker Panam for the discharge of oil into the coastal navigable waters of the United States. The Panam left Curacao bound for New York carrying a cargo of oil. Before departure the ship had been thoroughly inspected and had received two certificates of seaworthiness. Due to the continuous pounding of the seas as a result of a storm encountered en route, the rivets below the water line were sprung and began to leak oil into the water. The court held that libellant was not entitled to recover in this action because the discharge of oil upon the coastal, navigable waters was involuntary and accidental, and was caused by the abnormal or unusual pressure or strain upon the vessel as a result of the encountered storm. The discharge of oil was deemed an unavoidable accident, and was therefore not a violation of the Oil Pollution Act. (Barnett-Florida)
W70-10442

TRUSTEES OF INTERNAL IMPROVEMENT FUND V STARK (ACTION OF EJECTMENT TO RECOVER ARTIFICIALLY MADE STRIP OF COASTAL LANDS).

25 F Supp 730-732 (SD Fla 1938).

Descriptors: *Florida, *United States, *Riparian rights, *Spoil banks, Rivers, Navigable waters, Dredging, Channels, Channeling, Bays, Administration, Administrative agencies, Legal aspects, Judicial decisions, Boundary disputes, Shore protection, Coasts, Excavation, Civil engineering, Tidal waters, Islands, Riparian land, River beds, River training.

Plaintiffs, Trustees of the Internal Improvement Fund, sought to recover a small strip of land running parallel to the shoreline of the upland which was owned by defendants. This land was connected to the mainland at one end by a narrow neck and otherwise was separated from the mainland by navigable waters, thus creating a peninsula. There was no physical connection between defendant's mainland property and the peninsula. The land in question was created by the United States' dredging a channel and depositing the spoil in the shallow portion of the river. Defendants moved onto the parcel but had no record title to the peninsula. They claimed the land as against plaintiffs solely as owners with riparian rights of the neighboring upland. Plaintiff acquired the land pursuant to statutory provisions in a manner found by the court to be fully in compliance therewith. Upon the strength of this title, the court held that plaintiffs were entitled to have defendants ousted from the land. (Barnett-Florida)
W70-10443

SHUSTER V CITY OF CHISHOLM (LIABILITY FOR POLLUTION OF STREAM).
282 NW 135-136 (Minn 1938).

Descriptors: *Water pollution, *Minnesota, *Municipal wastes, *Sewage effluents, Water pollution sources, Sewage, Riparian land, Riparian rights, Riparian waters, Cities, Local governments, Sewage disposal, Waste water (Pollution), Judicial decisions, Legal aspects, Streams.

Plaintiff brought action against defendant city for damages which resulted from defendant's pollution by the discharge of sewage into a river which flowed by their farm. The court concluded that even though evidence showed another town also contributed sewage to the river, defendant and the other town were independent, not joint, tortfeasors. Evidence showed that defendant's sewage substantially contributed to the nuisance and was a proximate and contributing cause of plaintiff's damage. The lower court's judgment for plaintiff was affirmed. (Morris-Florida)
W70-10444

NELSON V TOWN OF NORTHUMBERLAND (TOWN'S RESPONSIBILITY TO MAINTAIN SEWERS PROPERLY).
5 A2d 39-40 (NH 1939).

Descriptors: *New Hampshire, *Sewage disposal, *Sewers, *Damages, Sewage, Sewage effluents, Cities, Legal aspects, Judicial decisions, Surface drainage, Surface runoff, Surface waters, Conduits, Construction costs, Drainage systems.

Plaintiff landowner brought action against defendant town for the alleged improper construction and maintenance of defendant's sewer. Plaintiff sought damages for injury to her property caused by the overflow of said sewer. Defendant contended that plaintiff had failed to establish the requisite causal connection between the alleged deficiencies in defendant's sewer and the damage suffered by plaintiff. From a judgment for plaintiff, defendant appealed. Defendant's appeal was based on its exception to the charge of the trial court to the jury that plaintiff was entitled to recover if the sewer was not sufficient to take care of the sewerage and surface water. The Supreme Court of New Hampshire held that the charge was erroneous and constituted reversible error. The court also ruled that the proper measure of damages would be either the cost that plaintiff originally incurred when connecting with defendant's sewer or the cost of constructing her private sewerage disposal plant. A new trial was ordered. (Price-Florida)
W70-10445

CAMDEN SEWER CO V MAYOR AND COUNCIL (USE OF SEWERS IN SURFACE WATER DRAINAGE).
185 A 126-129 (Md 1936).

Descriptors: *Maryland, *Local governments, *Sewers, *Surface drainage, Excess water (Soils), Community development, Contracts, Drainage, Judicial decisions, Legal aspects, Legislation, Natural flow doctrine, Overlying proprietor, Relative rights, Public rights, Water transfer, Drainage systems, Storm drains, Sewage disposal, Surface runoff.

Defendants mayor and city council granted plaintiff sewer company the franchise to lay sewer mains along an avenue and certain lateral streets. The city retained the right to drain surface water into the main sewer as long as it did not interfere with the primary purpose of the sewer. Instead, the city constructed catch basins which drained water into the lateral sewers, and eventually such sewers became choked with debris carried by the surface waters. Plaintiff sued for reimbursement of the expense of removing the obstruction, but received a verdict at trial of only $100. Plaintiff appealed on the grounds that the trial judge had refused to instruct the jury that under the franchise ordinance, defendant had no right to drain surface water into the lateral sewers. The appellate court held that this was a proper and necessary instruction and that plaintiff was injured by the trial judge's refusal to give it. A new trial was granted. (Clarke-Florida)
W70-10446

MIAMI BEACH JOCKEY CLUB V DERN (REVOCATION OF FILL PERMIT IN BISCAYNE BAY).
83 F2d 715-720 (DC Cir 1936).

Descriptors: *Florida, *Navigable waters, *Permits, *Land forming, Land development navigation, Inland waterways, Harbors, Non-navigable waters, Channels, Bays, Inlets (Waterways), Administrative agencies, Administrative decisions, Decision making, Judicial decisions, Legal aspects, Landfills, Regulation, Supervisory control (Power).

Plaintiff jockey club sought an injunction to prevent defendant Secretary of War from interfering with a bulkhead and fill project in Biscayne Bay. Plaintiff obtained a fill permit from defendant which was later revoked after protests by local landowners. Plaintiff contended that: (1) since Biscayne Bay was nonnavigable, defendant had no authority over the project; (2) defendant had no power to revoke the permit once granted; and (3) the revocation was arbitrary. The court stated that the bay was navigable in law if navigable in fact, adding that waters susceptible to use as a highway are navigable in fact. Because of its use in international shipping and its navigational channels authorized by Congress, the court held that the bay was navigable. Finding that defendant was authorized to revoke the permit, which was a mere license, and that the revocation was not arbitrary, the court denied the injunction sought by plaintiff. (Hart-Florida)

DE ROCHE V OSBORNE (POLLUTED WATER EVEN WITHOUT CONTAMINATED CLAMS JUSTIFIES CLOSING CLAM BEDS TO COMMERCIAL DIGGING).
37 NYS2d 348-351 (Sup Ct 1942).

Descriptors: *New York, *Clams, *Public health, *Commercial fishing, Conservation, Administrative agencies, Judicial decisions, Legal aspects, Regulation, Public benefits, State governments, Local governments, Cities, Water pollution, Social aspects, Commercial shellfish, Administrative decisions, Remedies.

Petitioner clam digger instituted a proceeding against New York defendants, Conservation Commission and Board of Health, to rescind defendants' order and resolution prohibiting the digging of hard clams in certain New York bays. Petitioner contended the order was unreasonable because New Jersey had not closed clam beds in portions of the same bays under its jurisdiction, and the clams dug therefrom were being sold in New York markets. Petitioner also argued that the report on the public health aspects of clamming in the bays failed to show a single contaminated clam. The Supreme Court of Richmond County, New York denied petitioners' application upon a showing that before the hearing New Jersey had taken the same action as defendants. The court affirmed the defendants' authority to certify those lands from which shellfish may be taken for use as food and to gulate all health matters. The court stated that where it was found that waters in which clam beds were located were polluted, defendants were justified in closing clam beds to commercial digging without waiting until clams themselves had become contaminated. (Powell-Florida)

BOARD OF SUP'RS V FRISBEE (CONDEMNATION VALUE OF PUBLIC EASEMENTS).
18 NYS2d 668-670 (Sup Ct 1940).

Descriptors: *New York, *Condemnation value, *Easements, *Local governments, Condemnation, Compensation, Access routes, Shores, Shore protection, Lakes shores, Lake Ontario, Coastal structures, Project purposes, Docks, Adjudication procedure, Judicial decisions, Legal aspects, Piers.

In a condemnation proceeding, a county sought to acquire title to certain property held as an easement in common by all the citizens of a city. The county commissioners determined that the easements were valueless, and defendants objected. The appropriated land was to be used as a site for wharves for the protection of the shoreline. The Supreme Court of Monroe County held that the easements had already become public in nature, so defendants lost nothing in the condemnation. The condemnation was, however, termed a technical taking and nominal damages were awarded. (Barker-Florida)
W70-10449

ALOTTO V CITY OF CORNING (CAUSE OF ACTION FOR CONTINUING WATER DAMAGE).
258 App Div 932, 16 NYS 575-576 (1939).

Descriptors: *New York, *Sewers, *Water injury, *Jurisdiction, Overflow, Local governments, Cities, Municipal wastes, Sewage, Sewage disposal, Legal aspects, Judicial decisions, Structures, Disposal, Administration, Management, Roads, Road construction, Remedies.

Plaintiff landowner brought action for damages allegedly caused by overflow from defendant city's sewers. Plaintiff contended that the sewers became inadequate to dispose of water and noxious materials as a result of a change in grade of defendant's street. The lower court dismissed the complaint as not stating a cause of action. The Supreme Court of New York reversed. A court of equity will recognize a cause of action to restrain a continuing invasion of property rights and will retain jurisdiction for determination of past damages. (Dye-Florida)
W70-10450

MORETTI V VILLAGE OF PEEKSKILL (DIVERSION OF STREAMFLOW).
12 NYS2d 687 (App Div 1939).

Descriptors: *New York, *Streamflow, *Natural flow, *Alteration of flow, Judicial decisions, Streams, Diversion, Floods, Surface runoff, Lakes, Surface waters, Watersheds (Basins), Flood damage, Local governments, Damages, Overflow, Running waters, Water injury, Legal aspects, Small watersheds, Snow, Snowmelt, Snow management, Melt water.

Plaintiff brought action against defendant village for damages to his house caused by the overflow of a stream running through his property. Plaintiff contended that defendant diverted the waters of a lake from their natural course and deposited them in the stream running through plaintiff's property, knowing that there was no sufficient outlet for such extra water. Plaintiff also contended that defendant deposited a large quantity of snow in the area surrounding plaintiff's stream, causing it to overflow. The Supreme Court of New York reversed the trial court's judgment for plaintiff. Plaintiff's own evidence showed that the lake from which the water was diverted was within the drainage area of the stream running through plaintiff's property. Diversion of the waters of the lake would thus have little effect on plaintiff's stream. (Dye-Florida)
W70-10451

SQUAW ISLAND FREIGHT TERMINAL CO V CITY OF BUFFALO (DAMAGES FOR SUBMERGED SAND INJURY).
256 App Div 582, 11 NYS2d 459-462 (1939).

Descriptors: *New York, *Damages, *Water pollution effects, *Dredging, Water pollution, Pollution abatement, Riparian rights, Soil contamination effects, Wastes, Fouling, Judicial decisions, Islands, Legal aspects, Bays, Erosion, Cities, Local government, Beds, Rivers, Navigable waters, Beds under water, Adjudication procedure.

Plaintiff owned an island in a navigable river and had, through dredging performed by a licensee, created a substantial bay or cove thereon. Defendant city deposited sewage in the river, thereby decreasing the value of the island and damaging the sand on the bed of the cove. Plaintiff sought damages and injunctive relief. Plaintiff contended that his damages should include the decreased value of the submerged sand and gravel and submitted evidence proving the amount of sand damaged and its value. The trial court awarded plaintiff damages for the decreased rental value of the island and the value of the ruined sand. On appeal defendant contended that plaintiff's lack of a license to dredge from the river rendered the sand valueless to plaintiff for purposes of sale. The Supreme Court of New York agreed, holding that plaintiff had the burden of proving a right to dredge sand before he was entitled to damages for injury thereto. Damages were awarded for decreased rental value alone. (Dye-Florida)
W70-10452

ROBINS ISLAND CLAM CO V GAFFGA (PROPERTY INTEREST IN CLAMS).
170 Misc 362, 8 NYS2d 969-970 (1938).

Descriptors: *New York, *Fisheries, *Clams, *Commercial shellfish, Oysters, Shellfish, Storms, Legal aspects, Judicial decisions, Hurricanes, Damages, Winds, Public rights, Commercial fishing, Fish harvest, Marine fisheries, Migration, Relative rights, Public rights, Public lands.

Plaintiff clam company planted clams on its property. Evidence indicated that the clams were removed from plaintiff's property by a severe storm. Plaintiff sought to restrain defendants from removing clams from property adjacent to plaintiff's land. Defendant contended that clams found on public lands may be reduced to possession by anyone, and that any property plaintiff may have had in the clams was lost when they were shifted to public lands. The Supreme Court of New York held for plaintiff. Evidence showed that for a significant period no clams had been found on the land now occupied by the clams in question. Clams are not capable of moving themselves. Thus the clams must have been moved by an act of God. It has been held that at least a qualified right of property may be obtained in oysters. The same is true of clams. Plaintiff was not divested of his property right in the clams by their movement. The court issued a 30-day injunction restraining removal of clams from the area within 150 feet west of plaintiff's property. (Dye-Florida)
W70-10453

IN RE JAMAICA BAY (CONDEMNATION OF SUBMERGED LANDS).
255 App Div 992, 8NYS2d 300 (1938).

Descriptors: *New York, *Beds, *Condemnation, *Condemnation value, Eminent domain, Legal aspects, Real property, Compensation, Judicial decisions, Governments, Local governments, Cities, Administration, Docks, Wharves, Roads.

Petitioner city sought to condemn lands under water which defendants claimed to own. The lower court found that title to the lands was in defendants and set the award. Both parties appealed. The Supreme Court of New York affirmed without comment. (Dye-Florida)
W70-10454

CITY OF NEW YORK V SWIFT AND CO (RIPARIAN RIGHT OF ACCESS TO WATER NOT SUBJECT TO RENT BY CITY OWNING RIVER BOTTOM).
162 Misc 561, 294 NYS 209-211 (1936).

Descriptors: *New York, *Riparian rights, *Access routes, *Rent, Cities, Local governments, Riparian land, Riparian waters, Navigable waters, Right-of-way, Regulation, Ownership of beds, Navigable rivers, Public rights, Docks, Leases, Compensation, Judicial decisions, Legal aspects, Relative rights.

Plaintiff city brought action against defendant riparian owner to recover the reasonable rental value of submerged land belonging to the city, over which defendant had constructed and maintained a freight platform. Plaintiff contended that it had the absolute right to improve the water front for navigation and therefore was entitled to exact rent from anyone using the waterfront. Defendant argued that, as an upland riparian owner, he had a right of access to the navigable water in front of his land. The court noted that although plaintiff's ownership of the river bottom was conceded, it did not appear that the city was exercising its right of improvement, and defendant's riparian right of access should therefore be respected. The court held that the maintenance of the freight platform was a reasonable exercise of defendant's riparian right and entered a judgement for defendant. (Liptak-Florida)
W70-10455

ELDRED DRAINAGE AND LEVEE DIST V WILCOXSON (DRAINAGE DISTRICT'S AUTHORITY TO LEVY AN ASSESSMENT TO PAY A JUDGMENT FOR DAMAGES).
365 Ill 249, 6 NE2d 149-152 (1936).

Descriptors: *Illinois, *Drainage districts, *Assessments, *Damages, Drainage systems, Taxes, Local governments, Legislation, Compensation, Real property, Administration, Ditches, Legal aspects, Judicial decisions, Condemnation, Eminent domain, Flood damage, Water injury, Remedies, Administrative agencies.

Plaintiff drainage district sought an assessment against defendant property owners to pay a judgment which had been rendered against plaintiff for flood damage to another property owner's land caused by the construction of a drainage ditch. Defendants objected to the assessment, contending that no assessment could be levied on property which received no benefit from the levy, and that the district had no authority to levy for the payment of a judgment in favor of another property owner. Affirming a judgment for plaintiff, the court held that the statutory restriction of assessments to property subject to benefit from the levy only applied to the original cost of an improvement, not subsequent obligations of the district. The court further noted that since the injured property owner had a constitutional right to compensation, the district must have had the authority to levy for the satisfaction of the judgment because the district had no other means of raising funds. (Liptak-Florida)
W70-10456

GEORGIA POWER CO V FEDERAL POWER COMM'N (LICENSING OF HYDROELECTRIC POWER PLANT).
152 F2d 908-914 (5th Cir 1946).

Descriptors: *Georgia, *Dams, *Federal Power Act, *Hydroelectric plants, Judicial decisions, Legal aspects, Hydroelectric project licensing, Hydroelectric power, Navigable waters, Permits, Rivers, Federal government, Non-navigable waters, Navigable rivers, Power head, Power plants, Reservoirs, Regulation, Administrative agencies, Administrative decisions.

Plaintiff power company proposed to build a hydroelectric power plant at a dam to be built by it on an allegedly non-navigable portion of a Georgia river. Intention of such was filed with the Federal Power Commission in accordance with the Federal Power Act. The Commission held hearings to determine if the construction of the plant would affect commerce on the navigable waters of the United States. The Commission decided that the project would affect interstate commerce and ordered plaintiff to apply for a license in accordance with the terms of the Federal Power Act. Plaintiff

sought reversal of the Commission's order, alleging that the provisions of the Federal Power Act did not apply to projects located on a non-navigable part of a stream. The court, relying on factual testimony of the commercial nature and use of the river and the definition of navigable waters as being those which are susceptible of being used in their ordinary condition (or by the means of artificial aids) as highways for commerce, affirmed the Commission's order requiring plaintiff to comply with and be licensed under the Federal Power Act. (Barnett-Florida)
W70-10457

NIAGARA FALLS POWER CO V FEDERAL POWER COMM'N (DIVERSION OF WATER FROM RIVER BY POWER COMPANY).
137 F2d 787-797 (2nd Cir 1943).

Descriptors: *Hydroelectric power, *Financing, *Diversions, *Administrative agencies, Alteration of flow, Diversion structures, Administrative decisions, Federal jurisdiction, Federal Power Act, Rivers, Treaties, Judicial decisions, Legal aspects, Capital, Jurisdiction.

Plaintiff power company, which operated a hydroelectric project on the Niagara River, sought to set aside orders of the Federal Power Commission reducing plaintiff's capitalization. The court affirmed defendant's orders, noting that any diversion of water from the Niagara River by plaintiff was subject to the authority of the Federal Power Commission. (Hart-Florida)
W70-10458

ALABAMA POWER CO V FEDERAL POWER COMM'N (FEDERAL POWER COMMISSION'S DETERMINATION OF HYDROELECTRIC PROJECT COSTS).
128 F2d 280-296 (DC Cir 1942).

Descriptors: *Alabama, *Hydroelectric power, *Federal Power Act, *Administrative agencies, Federal jurisdiction, Water resources development, Hydroelectric project licensing, Financing, Hydroelectric plants, Capital, Capital costs, Electric power costs, Electric power rates, Expenditures, Financial analysis, Permits, Judicial decisions, Legal aspects, State governments.

Plaintiff power company brought action to set aside orders of defendant commission determining the original cost of plaintiff's hydroelectric project. In a lengthy opinion primarily discussing financing, accounting methods and the authority of defendant to review plaintiff's accounts, the court noted that the privilege of exploiting the water resources of navigable streams is granted only by statute, and may be made subject to conditions appropriate to safeguard the public interest. The court then found that plaintiff, having received its license subject to these statutory limitations, could not avoid the comprehensive and inclusive powers of defendant. The prior judgment for defendant was affirmed. (Hart-Florida)
W70-10459

MAJOR AND CITY COUNCIL OF BALTIMORE V CROWN CORK AND SEAL CO (BOUNDARY LINES IN WATERS OF NAVIGABLE RIVER).
122 F2d 385-393 (4 Cir 1941).

Descriptors: *Maryland, *United States, *Cities, *Riparian rights, Navigable rivers, Docks, Boundaries (Property), Judicial decisions, Legal aspects, Riparian land, Landfills, Ownership of beds, Beds under water, Remedies, Airports, Navigable waters, Federal government, State governments, Boundary disputes, Local governments, Regulation.

The harbor engineer for the City of Baltimore, pursuant to state law and city ordinance, drew divisional lines into the waters of the Patapsco River, extending from property owned by the city and an adjoining corporation. These lines were utilized to delineate areas wherein the city and the corporation were entitled to exercise their respective riparian rights. The city airport was erected according to these lines and the corporation was required to adhere to them in erecting improvements on filled land in the river. A controversy arose between the city and the corporation as to the proper location of the division lines. The city wanted to abandon the existing lines and establish new ones, appropriating part of the corporation's lands. The trial court held for plaintiff corporation, finding that defendant city was estopped to deny the original divisional lines as being the proper ones since it had exercised rights otherwise inconsistent with the proposed change. The appellate court affirmed in part and reversed in part, limiting the holding to apply only as to the corporation before the court and not as against other riparian owners whose divisional lines had not yet been determined. (Barnett-Florida)
W70-10460

THE SS NEA HELLIS (VIOLATION OF OIL POLLUTION ACT).
116 F2d 803-806 (2nd Cir 1941).

Descriptors: *United States, *Oily water, *Admiralty, *Water pollution, Legislation, Oil wastes, Federal government, Remedies, Harbors, Oil, Judicial decisions, Legal aspects, Ships, State governments, Navigable waters, Tidal waters, Regulation, Fishing, Rivers and Harbors Act.

The United States brought libel in admiralty against a steamship to collect a penalty for violation of the federal Oil Pollution Act of 1924 for the discharge of oil into the coastal waters of the United States. Exceptions filed to the libel were sustained in the trial court. The court agreed with libelee that no proper allegations were put forth charging a violation of the Act. The Circuit Court of Appeals, Second Circuit, reversed, holding that although insufficient allegations were made to sustain the libel under the Act of 1924, those made were sufficient to charge a violation under the New York Harbor Act of 1888 which forbade the 'discharge of any matter into the tidal waters of the New York Harbor'. In light of a provision in the 1924 act stating that it was in no way to be construed as modifying or repealing any prior act, the court reasoned that there could be no argument that the Act of 1888 was not controlling. The two statutes were found to be complimentary in their effect and provided adequate relief for the violations alleged. (Barnett-Florida)

CUNNINGHAM V SKIRIOTES (VALIDITY OF MARINE BOUNDARY EXCEEDING THE INTERNATIONAL LIMIT AS AGAINST A FLORIDA CITIZEN).
101 F2d 635-637 (5th Cir 1939).

Descriptors: *Florida, *International law, *Commercial fishing, *Marine animals, Legislation, International waters, Tidal water, Ownership of beds, Beds under water, Navigation, Navigable waters, Wildlife conservation, Judicial decisions, Legal aspects, State jurisdiction, Jurisdiction, Reservation doctrine, Regulation, Supervisory control (Power).
Identifiers: *Sponges.

Plaintiff sheriff, for the state of Florida, appealed a decision of a federal district court which granted a habeas corpus petition of defendant sponge-diver who was charged with illegally taking sponges with diving apparatus. Defendant contended the jurisdictional limit of Florida is fixed by international law at three miles, and that since he was diving without this limit, Florida had no jurisdiction over him. Plaintiff asserted that the state had jurisdiction to its nine mile marine boundary. Finding that the state owned all tidewater beds within its jurisdiction, subject to the Congressional right to regulate navigation, the court concluded that Florida could regulate sponge-taking. The court agreed that international law fixed Florida's boundary at three miles, but also noted that the Florida limit of nine miles was equally valid as against Florida citizens, and thereby concluded that defendant could not question his own sovereign's boundary. The judgment of the lower court was reversed. (Hart-Florida)
W70-10463

SOUND MARINE AND MACHINE CORP V WESTCHESTER COUNTY (INTERFERENCE WITH NAVIGATION RIGHTS BY SEWER PIPE).

100 F2d 360-363 (2nd Cir 1938).

Descriptors: *New York, *Admiralty, *Pipelines, *Navigation, Riparian rights, Sewers, Pipes, Governments, Local governments, Federal government, Permits, Navigable waters, Channels, Riparian waters, Non-consumptive use, Relative rights, Remedies, Adjudication procedure, Judicial decisions, Jurisdiction, Federal jurisdiction, Legal aspects, Damages.

Plaintiff riparian landowner brought an action in admiralty to enjoin defendant from interfering with plaintiff's right to navigate on waters adjacent to plaintiff's property. Defendant had laid a sewer pipe across a channel adjacent to plaintiff's property and had thus decreased the low water depth, making it impossible for certain craft to use the channel in order to reach plaintiff's boat yard. Defendant argued that it was authorized to lay such pipe by permits from the War Department and the State of New York. The United States Circuit Court of Appeals, Second Circuit, ruled that admiralty jurisdiction was properly sought by the plaintiff since the injury complained of dealt with something intimately associated with the sea and navigation. The court remanded the case to the trial court for determination on the merits, adding that injunction is not a proper admiralty remedy and that the plaintiff should seek damages. (Barker-Florida)
W70-10464

HEID V ALLEGHENY COUNTY (DAMAGES FROM DIVERSION OF SURFACE WATER FLOW BY HIGHWAY IMPROVEMENTS).
122 Pa Super 312, 186 A 215-217 (1936).

Descriptors: *Pennsylvania, *Surface drainage, *Flood damage, *Eminent domain, Drainage water, Drainage, Surface runoff, Overland flow, Damages, Flooding, Highways, Roads, Judicial decisions, Floods, Flow, Natural flow, Drainage effects, Condemnation, Diversion.

In an action for damages, it was established that the state highway department in resurfacing a road had diverted the natural flow of surface water and turned it upon plaintiff's land. Plaintiff contended that the defendant county, as agent for the state, was liable for such damages. Defendant contended that, inasmuch as no actual entry had been made by the highway department upon the land, any damages caused by the improvement of the road were merely consequential and did not require compensation. The court agreed with defendant, holding that the turning of the water upon plaintiff's land was not a direct entry and thus gave rise to only consequential damages. The plaintiff was not entitled to recovery. (Snow-Florida)
W70-10465

IN RE OPINION OF THE JUSTICES (PUBLIC PURPOSE REQUIREMENT FOR CONSTRUCTION OF DAM WITH PUBLIC FUNDS).
190 A 425-431 (NH 1937).

Descriptors: *New Hampshire, *Public benefits, *Electric power, *Project purposes, Dams, Utilities, Structures, Flood control, Electric power industry, Public rights, Governments, State governments, Legal aspects, Judical decisions, Projects, Engineering structures, Financing, Costs, Taxes, Repayment contracts.
Identifiers: *Public purpose.

In an advisory opinion to the governor, the Supreme Court of New Hampshire ruled upon the constitutional validity of an act authorizing the pledge of the state's full faith and credit. The pledge was to guarantee the payment of bonds issued to construct a privately operated dam on the Connecticut River. The court ruled that the act was valid in that the pledge of credit was for a public purpose as required by the constitution. Public purpose was found because electric power and flood control protection would be provided to the people of the area. (Snow-Florida)
W70-10466

LEARY V CITY OF MANCHESTER (PUBLIC PURPOSE REQUIREMENT FOR THE EXERCISE OF THE POWER OF EMINENT DOMAIN).

21 A2d 156-160 (NH 1941).

Descriptors: *New Hampshire, *Condemnation, *Easements, *Project purposes, Ditches, Drainage, Eminent domain, Judicial decisions, Legal aspects, Local governments, Governments, Public rights, Compensation, Maintenance, Maintenance costs.
Identifiers: *Public purpose.

In an action for declaratory judgment to determine whether the defendant municipality could acquire by condemnation the full title to property in which it already had an easement, plaintiff contended that the taking would not be for an authorized public purpose. The defendant, having an easement to build a drainage ditch across plaintiff's land--conditioned upon proper maintenance of the ditch, contended that the expense of such maintenance was greater than the value of the property. Therefore, defendant argued, condemnation should thus be available so as to promote public economy. The court held that public economy was a matter of general welfare and, as such, was a public purpose for which the power of eminent domain could be exercised. Defendant could condemn the land. (Snow-Florida)
W70-10467

UNITED STATES V CERTAIN LANDS IN TOWN OF HIGHLANDS (OWNERSHIP OF POND BED).

52 F Supp 540-550 (SD NY 1943).

Descriptors: *New York, *Ownership of beds, *Boundaries (Property), *Boundary disputes, United States, Condemnation, Land tenure, Real property, Ponds, Beds, Beds under water, Lake beds, Governments, Judicial decisions, Legal aspects, State governments, Non-navigable waters.

In a condemnation suit, the United States sought to acquire land which surrounded a small lake. The issue to be determined by the court was whether title to upland fronting on a non-navigable body of water included title to the land under the water. The State of New York claimed title to the lake by escheat, arguing that the original owners of the upland had failed to specifically mention the title to the pond when the land was transferred. The United States District Court, Southern District of New York, ruled that grants of land surrounding a non-navigable body of water convey ownership of the land under water. Therefore, the state had no claim of ownership in the pond. (Barker-Florida)
W70-10468

LUCAS V CITY OF LOUISIANA (FLOOD DAMAGE CAUSED BY CITY'S NEGLIGENT FAILURE TO REMOVE OBSTRUCTION IN STREAM).
173 SW2d 629-636 (Mo Ct App 1943).

Descriptors: *Missouri, *Overflow, *Obstruction to flow, *Damages, Flood damage, Walls, Banks, Cities, Floods, Land tenure, Bridges, Streams, Legal aspects, Legislation, Construction, Structures, Rainfall, Local governments, Channel flow, Judicial decisions, Drainage, Surface runoff, Flood control, Natural streams.

Defendant city had constructed a stone wall along the banks of a stream flowing through plaintiff's property. The wall later collapsed, blocking the stream, which overflowed after a severe downpour and damaged plaintiff's bridge and other property. Plaintiff presented evidence that the city had negligently constructed the wall, and had negligently allowed it to obstruct the stream flow for some time before the flood. The court held that as the city had adopted the natural watercourse as a drainage outlet, it had a duty to keep the watercourse clear. The fact that no ordinance authorized construction of the statute was held not to obsolve the city from liability. (Caldwell-Florida)
W70-10469

CITY OF LOUISVILLE V COPE (LIABILITY FOR FLOOD DAMAGE CAUSED BY WATER BACKING UP FROM CITY'S STORM DRAIN).
296 Ky 207, 176 SW2d 390-393 (1943).

Descriptors: *Kentucky, *Subsurface drains, *Flood damage, *Backwater, Cities, Obstruction to flow, Floods, Rainfall, Drainage systems, Local governments, Streams, Overflow, Storm drains, Construction, Legal aspects, Judicial decisions, Sewers, Maximum probable flood, Water injury.

Plaintiff landowners brought action for damages against defendant city, claiming that their residences were periodically flooded by backwater from the city's storm drain. The backwater was allegedly caused by a bottleneck in the drain below plaintiffs' lands. Defendant claimed that plaintiffs were quilty of contributory negligence in failing to install backwater valves which would have prevented water from backing up into their residences. The court stated that where a city undertakes to establish drainage and sewer systems, it is under a duty to construct a system adequate to carry off ordinary amounts of rainfall. The fact that the residences were built after the sewer and 'came to the drain' was held not to absolve defendant from liability. Evidence by plaintiffs that backwater valves would not have prevented the damage overcame defendant's contention of contributory negligence, and the lower court's decision for plaintiffs was affirmed. (Caldwell-Florida)
W70-10470

CITY OF PHILADELPHIA V STANDARD OIL CO (RIGHT TO USE OF A BULKHEAD RETAINING WALL).
12 F Supp 647-651 (ED Pa 1934).

Descriptors: *Pennsylvania, *Riparian land, *Bulkheads, *Retaining walls, Low water mark, Riparian rights, Navigation, Docks, Shores, Rivers, Dredging, Ships, Basins, Silting, Judicial decisions, Legal aspects, State governments, River beds, Access routes, Eminent domain.

Defendant was an owner of riparian land within the Philadelphia city limits. Plaintiff city, acting in accord with state law, built a retaining structure along the low water mark in front of defendant's property as part of a 5 mile project to aid navigation. Defendant dredged the river bottom in front of its property to create a ship basin. Plaintiff contended that this basin could not be maintained without the aid of the bulkhead and as a result, defendant was violating a Pennsylvania law which prohibited riparian owners from using such structures for wart purposes without paying the proportionate cost thereof. The court held that the right of free access to navigable water by a riparian landowner includes the right to dredge the channel in front of such land. The city had the right to build the structure as a public improvement, but the Pennsylvania constitution proscribes the assessment of an individual property owner for the cost of improvements for the general public benefit. (Barnett-Florida)
W70-10471

PETRABORG V ZONTELLI (RIPARIAN RIGHT TO USE AND ENJOYMENT OF ENTIRE LAKE).
15 NW2d 174-184 (Minn 1944).

Descriptors: *Minnesota, *Lakes, *Riparian rights, *Riparian land, Recreation, Fishing, Dams, Severance, Boating, Swimming, Drainage systems, Pipelines, Reasonable use, Judicial decisions, Legal aspects, Navigable waters, Lake beds, Boundaries (Property), Mining, Wastes, Relative rights.

Plaintiff riparian landowner brought suit to enjoin the building of a dam and the drainage of a section of a navigable lake by defendant mining company. Plaintiff operated a resort on the western side of the lake, using said lake for boating, hunting, fishing and other recreational purposes in the proper exercise of his riparian rights. Defendant's drainage operations were to take place on the eastern section of the lake. The lake was divided into two sections, connected by a narrow portion of the lake. Defendant argued that this physical attribute of the lake made each section a separate lake, and thus his acts in no way violated plaintiff's riparian rights. Plaintiff argued that defendant's acts were a deprivation of those riparian rights without proper compensation or due process of law. The court affirmed the lower court's issuance of a permanent injunction against defendant, finding that defendant's acts would constitute a trespass and damage plaintiff's riparian rights. The court held that the lake was to be considered one lake, and defendant's acts would have deprived plaintiff of the use of that portion of the lake which all riparian owners were entitled to share equally. (Barnett-Florida)
W70-10472

TESENEER V HENRIETTA MILLS CO (RIGHT TO RECOVER PERMANENT DAMAGES FOR NEGLIGENT OPERATION DAM).
209 NC 615, 184 SE 535-540 (1936).

Descriptors: *North Carolina, *Deposition (Sediments), *Dams, *Streambeds, Damages, Beds, Land, Sands, Silts, Legal aspects, Judicial decisions, Real property, Operations, Engineering structures, Fertility, Soil properties, Crop production, Water injury, Easements, Flooding, Regulation, Backwater.
Identifiers: Debris.

Plaintiff riparian landowner brought action against defendant corporation for recovery of permanent damages to his land which resulted from the negligent operation of defendant's power dam, which was located about one mile below plaintiff's land. Plaintiff contended that silt, sand and debris were deposited upon twenty acres of fertile river bottom land. He further alleged that these deposits upon his land were caused by the negligent operation of defendant's dam and that such land was no longer suitable for crop production. Defendant dam owner denied such contentions and argued that the operation of its dam had always been proper. The court found plaintiff's allegations were sustained by the evidence and awarded him permanent damages. However, the court also granted defendant dam owner an easement to backwater and deposit silt and sand upon the twenty acres of plaintiff's land for which permanent damages had been granted. JOHN H HEALD CO V CHESAPEAKE AND O RY (TERMINATION OF LEASE INVOLVING WATER RIGHTS DISCHARGES ALL SUCH RIGHTS).

190 SE 325-328 (Va 1937).

Descriptors: *Virginia, *Canals, *Water users, *Leases, Water supply, Water contracts, Water demand, Railroads, Judicial decisions, Legal aspects, Water rates, Water rights, Public rights, Usufructuary right, Contracts.
Identifiers: Private rights.

Defendant railway company owned a canal which provided water to plaintiff corporation under a lease agreement. Subsequently, defendant agreed to sell its canal properties to a third party upon the condition that all public duties connected with the canal be discharged. Defendant had such public duties discharged in the manner prescribed by law. Furthermore, in conformity with the terms of its lease with plaintiff water user, defendant canal owner served notice of his intention to terminate such lease and discontinue the water supply. Plaintiff sought an injunction restraining defendant from discontinuing the water supply on the ground that plaintiff had a private right to the perpetual and undiminished supply of water at reasonable rates. The court held for defendant canal owner and stated that plaintiff water user had no right to the use of canal water beyond that specified in the lease. (Finman-Florida)
W70-10474

CONNER V JARRETT (BOUNDARY IMPLIED TO RUN TO CENTER OF STREAM).

200 SE 39-46 (W Va 1938).

Descriptors: *West Virginia, *Boundaries (Property), *Boundary disputes, *Real property, Land, Streams, Banks, Non-navigable waters, Judicial decisions, Legal aspects, Relative rights, Standards, Implied benefits, Grants.

Plaintiff brought an action of ejectment against defendant involving a small lot which bordered a stream. Plaintiff's deed called for the boundary line of such lot to run from a given point to a stake on the bank of a non-navigable stream. From that point the line was described to run up the stream by courses and distances, which closely corresponded to the course of the stream. Plaintiff contended that his boundary line should be held to follow the center of the stream. Defendant insisted that plaintiff's boundary line should be determined by the courses and distances called for in the deed. The court held for plaintiff, following the general proposition that where a boundary line ran to a point on a non-navigable stream, such description of the line implied that the line should follow the stream at its center unless the grant clearly excluded such construction. (Finman-Florida)
W70-10475

SOUTHLAND COFFEE CO V CITY OF MACON (LIABILITY FOR DAMAGES RESULTING FROM EXTRAORDINARY RAINFALL).
3 SE2d 739-744 (Ga Ct App 1939).

Descriptors: *Georgia, *Flooding, *Sewers, *Precipitation excess, Rainfall, Drainage systems, Drains, Cities, Damages, Rain, Rainfall intensity, Storms, Winds, Flood damage, Flood control, Obstruction to flow, Drainage water, Abatement, Legal aspects, Judicial decisions, Absorption, Intakes, Rainfall-runoff relationships.

Plaintiff company brought suit against defendant city to recover damages which resulted from the flooding of plaintiff's premises shortly after a severe rainstorm. Plaintiff alleged defendant maintained an inadequate storm sewerage system near his premises which constituted a continuing, abatable nuisance. Furthermore, plaintiff contended that defendant was negligent in failing to take necessary steps to correct the known inadequacy of the system. Defendant claimed that plaintiff's damages resulted from an extraordinary downpour of rain caused by an act of God. The court held for defendant, finding plaintiff's damages to have been caused by an extraordinary rainfall which resulted in the sewerage system being taxed beyond reasonable expectation. The court further found that as a result of the heavy rains and high winds, accumulation of debris in the streets had interfered with the normal process of absorption by intake basins and sewers. (Finman-Florida)
W70-10476

JOHNSTON V CITY OF ATLANTA (MUNICIPALITY NOT LIABLE FOR ERROR OF JUDGMENT IN SEWER SYSTEM PLANNING).
31 SE2d 417-419 (Ga Ct App 1944).

Descriptors: *Georgia, *Disposal, *Sewers, *Drainage systems, Surface waters, Sewage, Cities, Construction, Drainage water, Surface drainage, Judicial decisions, Legal aspects, Channels, Drains, Surface runoff.

Defendant municipality constructed a sewer system pursuant to a general drainage plan. A portion of this system consisted of an opening or an inlet into a sewer through which surface waters flowed. A water-trap or catch basin was constructed on three sides of the sewer opening which guided surface waters into the sewer. Subsequently, defendant eliminated the three-sided catch basin and placed a grate or grill over the sewer opening. Plaintiff contended defendant was negligent in changing the opening into the sewer as the new construction did not adequately channel surface waters to the sewer opening. The court stated that the duties of municipal authorities in adopting a general drainage plan involved the exercise of deliberate judgment and wide discretion. The court found for defendant, and held that a municipality is not liable for an error of judgment on the part of its officials in locating or planning improvements to its general system of drainage sewers. (Finman-Florida)

HASER V ALLEGHENY COUNTY (CONDEMNATION PROCEEDING TO CHANGE LOCATION OF A CREEK BED).
185 A 763-764 (Pa 1936).

Descriptors: *Pennsylvania, *Streambeds, *Diversion, *Eminent domain, Condemnation, Beds, Streams, Routing, Judicial decisions, Highways, Roads, Beds under water, Channels, Overflow, Remedies, Damages, Compensation, Local government, State governments, Legislation, Construction.

In a state highway condemnation proceeding, plaintiff contended that defendant county was liable for damages to his property resulting from a change of the location of a creek bed. When the creek bed was straightened and moved to facilitate the construction of a highway, the bed occupied a considerably larger portion of plaintiff's property than it had prior thereto. Defendant contended that it was immune from suit in that only consequential damages, which do not require compensation, were involved. The court held for plaintiff, stating that the legislation authorizing the construction of the highway specifically made the county liable for damages in such a situation. (Snow-Florida)

JANSKY V CITY OF TWO RIVERS (OWNERSHIP OF LAKE RELICTION).
278 NW 527-533 (Wis 1938).

Descriptors: *Wisconsin, *Accretion (Legal aspects), *Boundaries (Property), *Cities, Lake Michigan, Lakes, Land tenure, Real property, Riparian waters, Riparian rights, Prescriptive rights, Riparian land, Legal aspects, Judicial decisions, Highways, Roads, Boundary disputes.

Plaintiff riparian landowner brought action against defendant city and other riparian owners to quiet title to property created by reliction. Plaintiff owned two lots bordering upon Lake Michigan; defendant city's street terminated at the lake. The lake had receded 425 feet from the original waterline. Plaintiff claimed ownership of the reliction between his lots and the new waterline. Defendant contended that the reliction had been used during the prescriptive period as a public highway, and therefore plaintiff had no riparian ownership. Evidence showed that the street ended at the lake with a stone wall, barricade, and danger sign; the court held this evidence disproved the use of the reliction as a public highway. Finding that plaintiff's title gave him riparian ownership, the court apportioned the reliction between the several owners, including defendant city by drawing a straight line perpendicular to the new shoreline from the intersection of the riparian owners' division lines and the old shoreline. MEYERS V LAFAYETTE CLUB (RIPARIAN OWNER'S RIGHT TO DRAW LAKE WATER FOR SPRINKLING: REASONABLENESS OF USE).
266 NW 861-867 (Minn 1936).

Descriptors: *Minnesota, *Riparian rights, *Reasonable use, *Irrigation water, Navigable waters, Lakes, Riparian land, Water levels, Judicial decisions, Damages, Natural use, Domestic water, Legal aspects, Relative rights, Recreation, Diversion, Consumptive use.

Plaintiff riparian owners sought to enjoin defendant golf club from drawing water from a lake on which defendant was also a riparian owner. Plaintiffs contended that the lake's water level was being diminished by defendant club's use. Defendant contended that its use of the lake water for sprinkling its riparian land was a reasonable domestic use which did not substantially reduce the water level. The Supreme Court of Minnesota held that as long as there was no substantial damage to other riparians or to the public interest, defendant club had the right to make a reasonable use of the lake water for domestic purposes or for proper upkeep of its riparian land. MARCHAND V MARCHAND FERRY CO (PUBLIC RIGHTS TO LANDING ON PRIVATE PROPERTY ADJOINING A NAVIGABLE STREAM).
51 D and C 79, 7 Fay L J 37-40 (Pa C P 1944).

Descriptors: *Pennsylvania, *Public rights, *Highways, *Docks, Navigable waters, Navigable rivers, Relative rights, Real property, Riparian rights, Roads, Easements, Right-of-way, Legal aspects, Rivers, Transportation, Access routes, Land tenure.

Plaintiffs owned riverfront property across which ran a public highway ending at the water's edge.

Defendant ferry company had for a long period leased the property from plaintiffs for use as a ferry landing. Defendants refused to pay further rent and were ejected. Defendants sought to open the judgment in ejection on the grounds that the ferry landing was part of a public highway and, as such, was open to use by all. The court disagreed. Although a public highway had been constructed on the banks of a navigable stream, the public acquired only a right to passage over the highway. The use of the landing was an additional servitude for which users were required to compensate the owners of the property. (Dye-Florida)
W70-10484

CIMINELLI V LIBURDI (FLOOD DAMAGE RESULTING FROM GRADE CHANGE BY ADJOINING LANDOWNERS).
47 Lac Jur 31-32 (Pa C.P. 1942).

Descriptors: *Pennsylvania, *Flooding, *Relative rights, *Land use, Real property, Judicial decisions, Channels, Graded, Surface drainage, Surface waters, Runoff, Surface runoff, Reasonable use, Competing uses, Diversions, Land, Drainage, Grading, Adjudication procedure, Riddance (Legal aspects), Diversion, Natural flow.

Plaintiff sought relief from flooding of his property caused by a change in grade of defendant's adjoining property. Defendant contended that plaintiff's bill contained insufficient allegations to support it. The Court of Common Pleas of Lackawanna County sustained the objection, but gave plaintiff leave to amend. Every man has the right to full use of his property. If, through non-negligent use, a landowner's neighbor is harmed, the neighbor has no grounds for relief. However, where a landowner cuts an artificial channel which causes waters to be concentrated and discharged with greater than usual force onto another's land, he is liable. A complaint to be sufficient must allege the cutting of such a channel. (Dye-Florida)

MCNEELY AND PRICE CO V PHILADELPHIA PIERS, INC (CONTROL OVER WHARFAGE TARRIFS).
196 A 846-861 (Pa 1938).

Descriptors: *Pennsylvania, *Docks, *Tariff, *Federal jurisdiction, Regulation, Coastal structures, Piers, Federal government, Judicial decisions, Tidal waters, Relative rights, Administrative agencies, Governments, State governments, State jurisdiction, Assessments, Foreign trade.

Plaintiff, a shipper in foreign commerce, sought to enjoin defendant wharf owners from imposing a fee upon shippers for the privilege of using their wharf. The plaintiff contended that such a fee could not be imposed because such had not been approved by the state's Public Utility Commission. Defendants contended that the Public Utility Commission was without jurisdiction to approve wharfage charges because such regulation was within the sole power of the federal government in the regulation of commerce. The court held that wharfage charges were matters falling within the federal government's commerce power and that Congress had preempted the area by passing legislation to the effect that states were without authority to regulate the same. The court also rejected plaintiff's contention that lands bordering on tide water were subject to the regulation by the states alone. The court ruled that this is the case when commerce is not involved, but when regulation of commerce is involved, then the federal government has plenary power. The injunction was denied. (Snow-Florida)
W70-10486

GARRISON V ENGLE (OWNERSHIP OF SUBMERGED LANDS WHERE HIGH WATER MARK HAS CHANGED).
193 A 820-824 (NJ Ch 1937).

Descriptors: *New Jersey, *High water mark, *Ownership of beds, *Boundaries (Property), Navigable waters, Riparian waters, Riparian land, Riparian rights, Relative rights, Boundary disputes, Shores, Beds, Beds under water, Piers, Bays, Judicial decisions, Fluctuation, Water levels, Water level fluctuations, Tidal waters, Legal aspects.

In an action for injunction, plaintiff, owner of a certain riparian grant of land under the tide waters of the Delaware Bay, sought to stop defendant from erecting a pier which would extend from the defendant's property on the shore out into the bay and upon the submerged lands of plaintiff. Defendant contended that he was the owner of the submerged land which extended from his shore property. Defendant's contention was based upon the fact that he had been deeded property extending to the high water mark of the bay and that over time the high water line advanced upon his property. Defendant asserted that he yet owned to the original mark. The court held that when the high water mark of navigable waters is the boundary of property, such boundary is subject to change as the high water line changes. Defendant's ownership thus extended from the new high water mark and not from the original mark. Consequently plaintiff was the owner of the submerged land upon which the pier was to be constructed, and such ownership entitled plaintiff to have the construction of the pier enjoined. (Snow-Florida)
W70-10487

FREEMAN V CITY OF LAKEMILLS (LIABILITY FOR INJURY CAUSED BY NATURAL PROCESSES).
243 Wis 537, 11 NW2d 181-182 (1943).

Descriptors: *Wisconsin, *Natural flow, *Channel morphology, *Storm runoff, Storm drains, Surface waters, Sewers, Creeks, Seepage, Alteration of flow, Cities, Damages, Judicial decisions, Legal aspects, Obstruction to flow, Outlets, Tile drains, Ditches, Drainage practices, Relative rights, Riparian rights, Riparian land, Flooding, Overflow, Channel flow.

Plaintiff landowner brought action to abate an alleged nuisance and for damages for injury to his property. Plaintiff contended that seepage into his basement was caused by the overflow of a natural watercourse adjacent to his property into which flowed surface water from defendant city's storm sewers. Plaintiff contended further that such action by defendant caused refuse deposition in the creek and caused the bed of the creek to be raised, and that the channel change which resulted from the raising of the bed caused the overflow. Defendant admitted only that it had used the creek for an outlet for its storm water, and contended that the evidence did not support the trial court's judgment for plaintiff. The Supreme Court of Wisconsin held that a city has the same right with reference to surface waters as an individual would have. Cities are not liable to riparian owners for material and water that flows from their streets into surrounding streams. The change in the channel of the creek and the raising of the water was a natural process for which no legal liability could be placed on defendant. The judgment for plaintiff was reversed. (Price-Florida)

SIOUX CITY V BETZ (OWNERSHIP OF BEDS OF NAVIGABLE STREAM).
4 NW2d 872-873 (Iowa 1942).

Descriptors: *Iowa, *Land forming, *Patents, *Ownership of beds, Navigable waters, Missouri River, Accretion (Legal aspects), High water mark, Land tenure, Landfills, Channel morphology, Judicial decisions, Legal aspects, Cities, Real property, Beds under water.

Plaintiff city claimed title to certain lands through a patent from the state. The land was created by defendant's dumping of dirt into a navigable stream over a period of ten years. Defendant claimed the land through adverse possession. The court ruled that defendant had failed to prove the elements of adverse possession, and further that such defense was not available as against the state. The tract of land in question was situated below the high water mark of the river and as the state had title to the bed of the river from the high water mark to the center of the river, title to the land in question passed to plaintiff under the patent. Judgment for plaintiff was affirmed. (Clarke-Florida)

RUPP V KIRK (RIPARIAN OWNER'S TITLE TO ACCRETION).
4 NW2d 264-266 (Iowa 1942).

Descriptors: *Iowa, *Accretion (Legal aspects), *Channel morphology, *Alluvium, Navigable waters, Missouri River, Alluvial channels, Boundaries (Property), Boundary disputes, Sand bars, Chutes, Legal aspects, Judicial decisions, Vegetation, Vegetation growth, Channel erosion, Erosion.

In a riparian owner's suit to quiet title to land along the Missouri River, plaintiff alleged the land belonged to him as accretive land. Defendant claimed the land as an island and by adverse possession. The court rejected defendant's argument as to adverse possession and ruled that the evidence warranted a decree for plaintiff. The river had receded in 1927 and formed the bar in controversy, out from the shore of plaintiff's land, by gradual and imperceptible action of its waters. The land was therefore accretive land and plaintiff had title. Judgment for plaintiff was affirmed. (Price-Florida)
W70-10490

TODD V MURDOCK (RIPARIAN OWNERS' RIGHTS TO FRONTAGE ON NEW RIVER SHORE PROPORTIONATE TO ORIGINAL FRONTAGE).
300 NW 284-286 (Iowa 1941).

Descriptors: *Iowa, *Boundary disputes, *Accretion (Legal aspects), *Riparian land, Navigable waters, Missouri River, Erosion, Meanders, Shores, River flow, Riparian rights, Legal aspects, Judicial decisions, Boundaries (Property), Relative rights.

Plaintiffs sought to quiet title to certain land and to enjoin the construction of a fence thereon. Plaintiffs' lot and lots east thereof were originally bounded on the south by the Missouri River. Due to a southerly change in the course of the river, a considerable amount of land was formed between the lots and the new river bank. Plaintiffs claimed title by adverse possession and through a deed to the accreted lands south of their lots asserting that the boundary lines of the lots should merely be extended in their original direction to the bank. Defendant contended that new boundary lines should be drawn so as to save to save to all lot owners river frontage similar to that originally held. The court rejected plaintiffs' claim based on adverse possession. The court also found that the deed through which plaintiffs claimed was ineffective as to third parties. Landowners can agree as to the division of accreted lands except where rights of third parties would be infringed upon. The court held that defendant was entitled to frontage on the new shore proportionate to his frontage on the old shore. The trial court's decree for defendant was affirmed. (Price-Florida)
W70-10491

LUNDBERG V UNIVERSITY OF NOTRE DAME (APPLICABILITY OF NORTHWEST ORDINANCE TO NON-NAVIGABLE WATERS).
282 NW 70-77 (Wis 1938).

Descriptors: *Wisconsin, *Navigable waters, *Navigation, *Access routes, Legislation, Highways, Transportation, Lakes, Rivers, Navigable rivers, Real property, Judicial decisions, Legal

spects, Federal government, Mississippi River, Easements, Rightlof-way, Bodies of water.

Plaintiffs owned a summer resort on Tenderfoot Lake. Defendant University owned all the land surrounding nearby Plum Lake, 1400 feet northeast of Tenderfoot Lake, and all the land between the two lakes. Defendant erected a fence across a trail between the two lakes, and plaintiffs sought removal of the fence contending that: (1) the Northwest Ordinance of 1787 prohibited closing of a carrying place which is part of a public highway; and (2) plaintiffs had established an easement of passage between the lakes by prescription. The trial court found for plaintiffs on the first ground, not considering the second. The Supreme Court of Wisconsin reversed. The courts of Wisconsin are bound by the Northwest Ordinance. The ordinance provided for free and open access to navigable waters leading into the Mississippi or St. Lawrence Rivers and to carrying places or portage paths between such waters. The Ordinance applies only to waters found to be navigable and actually used for commerce at the time of the passage of the ordinance. However, the path here in question was not used for commerce in 1787, and defendant was entitled to erect a fence thereon. (Dye-Florida)

IN RE TRIBOROUGH BRIDGE APPROACH CONDEMNATION OF WATERFRONT PROPERTY).
159 Misc 617, 288 NYS 697-720 (1936).

Descriptors: *New York, *Condemnation, *Cities, *Eminent domain, Riparian rights, Public rights, Wharves, Docks, Legal aspects, Condemnation value, Right-of-way, Compensation, Judicial decisions, High water mark, Low water mark, Bridges, Real property, Beds, Ownership of beds, City planning, Local government, Administration, Navigation.

The City of New York sought to condemn property for construction of a bridge approach. Claimants to one lot contended that property to the low water mark was appurtenant to their upland property. Other claimants sought compensation for destruction of riparian rights appurtenant to a damaged lot at the location of a marginal street. (A marginal street is one used in connection with wharves and for the purpose of commerce. Such a street destroys riparian rights in appurtenant land. A marginal street is not public.) Claimants also sought compensation for a pier built by the city between high a low water mark adjacent to claimant's upland. The court stated that land between the low and high water mark belonged to the city unless specifically granted away. The court said claimants could have obtained title to the pier only if its construction was by a wrongdoer. The city in the instant case owned the property upon which the pier was constructed, thus it was not a wrongdoer. However, claimants were entitled to compensation for the taking of property on which the city had built a marginal street where claimants original grant excepted land to be used for public streets. (Dye-Florida)
W70-10493

ST REGIS PAPER CO V NEW HAMPSHIRE WATER RESOURCES BD (LOGGING SLUICEWAY FOR DAM).
26 A2d 832-842 (NH 1942).

Descriptors: *New Hampshire, *Dams, *Lumbering, *Pulp and paper industry, Access routes, Administrative agencies, State governments, Riparian rights, Navigation, Ownership of beds, Relative rights, Riparian land, Riparian waters, Navigable rivers, Dam construction, Sluices, Bypasses, Judicial decisions, Legal aspects, Public rights, Administrative decisions, Decision making.

Plaintiff paper company sued to require defendant water resources board to provide a means for passage of logs past a dam on a navigable river. Plaintiff claimed the right for passage of logs as a member of the public. However, use of the river for logging had been discontinued prior to construction of the dam. The court stated that public rivers were held in trust for the people, and also that when a stream is capable of public service in its natural state, it is public. Navigability was found to be only one test for useful public service. The court found that: (1) individual citizens were entitled to use public waters in a personal capacity only derivatively from their right as a member of the public, since their rights are unvested, non-property rights; (2) even riparian rights provide no right of action against state control of public water which does not damage private land; and (3) state regulation of the right to use public water included the power to bar use altogether. Reasoning that since logging was discontinued prior to dam construction, defendant had not arbitrarily failed to provide a sluiceway, and furthermore had no duty to provide one, the court gave judgment for defendant. (Hart-Florida)
W70-10494

CULLEY V HOLLIS (RIGHTS OF OWNERS OF LAND ABUTTING NAVIGABLE STREAMS TO ERECT IMPROVEMENTS IN SUCH STREAMS).
25 A2d 196-198 (Md 1942).

Descriptors: *Maryland, *Leases, *Competing uses, *Riparian rights, Relative rights, Navigable waters, Ownership of beds, Oysters, Conservation, Shores, Creeks, Permits, Federal government, State governments, Legislation, Riparian waters, Riparian land, Accretion (Legal aspects), Patents, Structures, Piers, Judicial decisions, Legal aspects, Usufructuary right.

Plaintiff sought to enjoin the construction of a pier by defendant. Plaintiff owned a lease giving him the right to grow and harvest oysters in the bed of a navigable stream. Defendant's land abutted the stream and the pier being constructed from defendant's land into the stream caused considerable damage to plaintiff's oyster bed. Plaintiff claimed his rights through a lease from the state and defendant relied on a state statute which gave proprietors of land bordering on navigable streams the exclusive right to make improvements into the water in front of their land. Piers had been previously determined by case law to be such an improvement as contemplated by the statute. Plaintiff contended he had a property right because of the lease which could not be taken without due process of law. The court ruled that when plaintiff acquired his lease he did so with notice of the above mentioned statute, and that owners of property abutting on the waters in which his lease was located had a right to make improvements from their land into the waters. The judgment for defendant was affirmed. (Price-Florida)
W70-10495

HOOD V CITY OF NASHUA (PRIVATE NUISANCE CAUSED BY IMPROPER MAINTENANCE OF CULVERT).
13 A2d 726-728 (NH 1940).

Descriptors: *New Hampshire, *Culverts, *Surface drainage, *Percolation, Surface runoff, Drainage practices, Damages, Relative rights, Drainage, Drainage effects, Drainage water, Drains, Cities, Legal aspects, Judicial decisions, Impounded waters, Impoundments, Structures, Percolating water, Seepage, Topsoil, Outlets, Subsoil.

Plaintiff landowner brought action for damages to his property which resulted from defendants' negligent maintenance of its drainage system. Water was allowed to collect in large quantities and flow through a culvert maintained by defendant onto land adjacent to plaintiff's land. From there the water would percolate into plaintiff's cellar. Defendant contended that there was a lack of the establishment of the necessary causal connection between the alleged improper maintenance and the injury suffered by plaintiff, that plaintiff had suffered no special damages that would give him the right to initiate such an action and that plaintiff had not given defendant notice of his intent to bring the action. The court ruled that the evidence supported the inference that the maintenance of the culvert caused the injury suffered by plaintiff, that plaintiff was the only one who suffered injury because of the culvert, that the negligent maintenance of the culvert was a private and not a public nuisance and that notice of intent to bring action was not required. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W70-10496

FIRST NAT'L BANK AND TRUST CO V ZONING BD OF APPEALS (OWNERSHIP OF BEDS OF NAVIGABLE WATERS).
126 Conn 228, 10 A2d 691-696 (1940).

Descriptors: *Connecticut, *Sea walls, *Navigation, *Ownership of beds, Navigable waters, High water mark, Low water mark, Riparian rights, Legislation, Grants, Permits, Right-of-way, Cities, Local governments, Administrative agencies, Administrative decisions, Legal aspects, Judicial decisions, Boundary disputes, Zoning, Public rights.

Plaintiff owned a mainland lot and an island across therefrom. To bring himself within zoning laws, plaintiff contended the two tracts were actually one lot. Plaintiff relied on grants by the state to his predecessors in title permitting the construction of seawalls between the high and low water mark in front of the tracts. Also granted was the right to fill in the space between the walls if such did not impede public navigation. Land thus created was to be the builders of the walls. Plaintiff contended the grants gave him in fee the land below the high water marks and therefore connected the two parcels. The court ruled the land did not belong to plaintiff as no sea walls had been constructed or fill created. The court found the waters between the tracts to be navigable at high tide, and to allow the interpretation contended for by plaintiff would infringe on public rights and rights of other riparian owners. (Price-Florida)
W70-10497

HARZ V BOARD OF COMMERCE AND NAVIGATION (TITLE TO SUBMERGED LAND).
126 NJ Eq 9, 7 A2d 803-808 (1939).

Descriptors: *New Jersey, *Submergence, *Boundary disputes, *Erosion, Waves (Water), Bank erosion, Accretion (Legal aspects), Low water mark, High water mark, Tides, Tidal effects, Tidal waters, Shores, Navigable waters, Leases, Grants, Condemnation, Land tenure, Legislation, Legal aspects, Judicial decisions, Administrative agencies, Overlying proprietor.

Defendant Board of Commerce and Navigation's lot abutted a bay and was located between the bay and plaintiff's lot. Originally the high water mark of the bay was on the lot now claimed by defendant. At the time defendant bought the lot it was submerged at high tide and the high water mark was on plaintiff's lot. Plaintiff sought a riparian lease with an option to buy the lands under the water of the bay in front of his lot. Defendant contended its lot was the upland bordering on the bay and it was entitled to the grant sought. The court stated that when what was once fast land is lost by erosion and is submerged at high tide, title thereto is in the state while it is submerged. A proprietor is subject to loss by erosion without remedy as he is subject to gain by accretion. The court held that plaintiff was the present riparian owner. Injunctive relief was withheld to give defendant a reasonable time to begin condemnation proceedings. (Price-Florida)
W70-10498

LEARY V CITY OF MANCHESTER (LIABILITY FOR NUISANCE CREATED BY FAILURE TO PROPERLY MAINTAIN DRAINAGE DITCH).
6 A2d 760-762 (NH 1939).

Descriptors: *New Hampshire, *Easements, *Ditches, *Drainage, Drainage effects, Drainage practices, Drainage water, Drains, Cities, Surface waters, Relative rights, Legal aspects, Judicial decisions, Water quality control, Water demand, Water levels, Municipal water.

Plaintiff landowner sought to abate an alleged nuisance caused by defendant city's construction and maintenance of a drainage ditch across plaintiff's land. Defendant had been granted an easement across the property for the purpose of draining off surface water which menaced the purity of its water supply. The ditch was to be maintained so as to cause no unreasonable or unnecessary damage to the premises. Defendant failed to maintain the ditch, and the court ruled that the condition which resulted constituted a nuisance from which plaintiff was entitled to relief. (Price-Florida)
W70-10499

ROONEY V MILLSTONE TP (DAMAGES FROM DISCHARGE OF SURFACE WATER DRAINAGE).
121 NJL 624, 3 A2d 580-581 (1939).

Descriptors: *New Jersey, *Drainage water, *Surface waters, *Flood damage, Drainage, Drainage systems, Surface runoff, Surface drainage, Drains, Runoff, Judicial decisions, Highways, Roads, Damages, Flooding, Ponding, Diversion, Routing, Alteration of flow, Diversion structures, Cities, Local governments, Jurisdiction.

In an action for damages, plaintiff contended that defendant municipality, while improving a road, built a catch basin upon plaintiff's property which from time to time overflowed causing damage to plaintiff's property. Defendant contended that it was immune from suit. The court held that a municipality has no right, by artificial drains, to divert surface water from its ordinary course and cast it, in a body large enough to do substantial injury, on land where, but for such artificial drains, it would not naturally go. The liability arising from such action is not to be dismissed due to a municipal corporation's exemption in that an active wrongdoing is involved to which the exemption does not apply. Defendant was thus held liable for the damages done to plaintiff's property as a result of the diversion of surface water. (Snow-Florida)

Descriptors: *Geese (Wild), Ducks (Wild), *Ecology, *Waterfowl, Washington, Wildlife, *Canada Goose.
Identifiers: Snake River (Washington).

Data on nesting habits of the Canada Goose were collected in 1966, 1967, 1968, 1969, and 1970. During 1969 and 1970, significant differences from the 1954-65 data reported by Buss and Wing (1966) were noted. Sand or soil was preferred to rock for nest substrate. Twelve nest sites were reused one to four times between 1960 and 1967. One successful re-nesting attempt occurred with a 12-day re-nesting interval. Observations indicated that 50% or more of the gosling production on the Snake River came from cliff or riverbank nests. Broods remained within 1 mile of their island nests for several days and then moved slowly upstream or downstream. Many broods were reared in grassy pastures adjacent to the river. A rapid increase in geese in July and August, appearing shortly after the young gained greater mobility, suggested that geese had hatched in cliff and riverbank nests or had moved into the study area from elsewhere. Observations of marked geese and direct counts indicated that most locally reared geese as well as new arrivals left the study area in late August. Data on marked and banded birds indicated that at least a part of the local population wintered in east central Washington within 50 miles of the study area. Migrant geese began arriving on the Snake River in mid-September, and maximum numbers were observed in late November and December. About 25 percent of the geese observed in the winter were B.c. minima. None of the artificial islands or nesting structures were utilized for nesting during the first year after their construction.

AESTHETIC FACTORS IN PLANNING AND DESIGN OF LIBBY DAM,
Army Engineering District, Seattle, Wash.
Sydney Steinborn.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No PO1, p 39-54, Jan 1970. 16 p, 14 fig.

Descriptors: *Concrete dams, Dams, *Aesthetics, *Architecture, Gravity dams, *Environmental effects, *Environmental engineering, Environment , Landscaping, Structural design, Powerhouses, *Planning, Transmission lines, Project planning.
Identifiers: Visitor centers, *Libby Dam, Mont, Beautification.

The aesthetic and environmental planning and design of the Libby Dam Project in northwestern Montana are presented. Libby Dam is 3,000 ft long, 420 ft high, and contains 4,000,000 cu yd of concrete. The dam is in a beautiful mountain valley, and a major effort was and is being made in design and construction to minimize the impact of this massive structure on the environment. Development of a comprehensive landscape plan for the dam and immediate vicinity by a prominent consulting architect is described. Considerable attention was given to accommodation and movement of the visiting public. Details of these concepts and a design flow chart of the aesthetic and environmental planning process are presented. (USBR)

MAN-WATER RELATIONS IN THE EAST CENTRAL SUDAN,
Birbeck Coll., London (England). Dept. of Geography.
Anne Graham.
In: Environment and Land Use in Africa, Chapter 15, p 409-445, Methuen, London, 1969. 9 fig, 1 tab, 6 ref.

Descriptors: *Economic impact, *Social function, *Social charge, *Semiarid climates, Agriculture, Grazing, Rainfall, Wells, Tropical regions, Water supply, Rural sociology, Human population, Livestock.
Identifiers: *Peasant agriculture, *Sudan, *Nomadism, *Immigration, Transhumance, Sedentarism, Hafirs, Local movement.

In contrast to large-scale irrigation projects rural water schemes have the advantage of spreading benefits over a large area with minimal costs and political problems. Ghedaref District in the central Sudan is a generally semiarid region with a seasonal rainfall whose mean value decreases from south to north. The population is made up of many races with diverse ways of life from several parts of Africa. Water supplies range from consistently abundant and reliable to seasonal and highly unreliable. Agriculture varies from grazing to sesame and dura sorghum crops with only a few areas growing cotton and vegetables. The ways of life are determined by water supplies and are of 4 main types: (1) nomadism, (2) transhumance, (3) local movements, and (4) sedentarism. The dominant clay plain has recently been exploited by governmental construction of excavation reservoirs (hafirs) which act as catchments during the rainy season, facilitating more extensive agriculture and year-round settlements. This has increased immigration and the increased population densities have in turn often acted to extend old problems rather than solve them. The resulting effects on the economics and sociology of the region are discussed. (Casey-Arizona)

OPTIMUM OPERATING PROCEDURE FOR A RIVER GAGING STATION ESTABLISHED TO

PROVIDE DATA FOR DESIGN OF A WATER SUPPLY PROJECT,
Geological Survey, Washington, D.C.
Marshall E. Moss.
Water Resources Research, Vol 6, No 4, p 1051-1061, August 1970. 11 p, 9 fig, 14 ref.

Descriptors: *Data collections, *Optimization, *Cost-benefit analysis, *Hydrologic data, *Gaging stations, Water yield, Reservoir design, Streamflow forecasting, Economics, Statistics, California.
Identifiers: Sensitivity analysis, Data costs.

A scheme for determining the optimum length of streamflow record and the optimum frequency of discharge measurements was applied to the gaging station on Arroyo Seco, an intermittent stream near Soledad, California. If the streamflow record is used only in the design of a water supply reservoir at the gage site, the optimum record length is found to vary between 9 and 56 years, depending on nonhydrologic time constraints. The optimum frequency of measurement of discharge for calibration of the station rating curve is found to be indeterminate. Sensitivity analysis indicates that the optimum length of record is more sensitive to the variability of the streamflow and the planned level of development at the site than to discount rate or cost of obtaining streamflow data. (Knapp-USGS)

ESTIMATING COEFFICIENTS OF A FLOW GENERATOR FOR MONOTONE SAMPLES OF DATA,
American Univ., Washington, D.C.; and Geological Survey,
David S. Crosby, and Thomas Maddock, III.
Water Resources Research, Vol 6, No 4, p 1079-1086, August 1970. 8 p, 13 tab, 8 ref, append.

Descriptors: *Synthetic hydrology, *Data collections, *Time series analysis, Correlation analysis, Streamflow forecasting, Statistical methods, Statistics, Regression analysis, Hydrologic data, Gaging stations.
Identifiers: Monotone samples.

If a set of flow records continuous in collection to the present has different starting times, it forms a monotone sample. The monotone sample may yield an inconsistent lag zero convariance matrix. In addition, it may be impossible to calculate real-value coefficients for a flow generator, leading to some complex values for the synthetic flow trace. A technique is presented that produces a consistent lag zero covariance matrix and a realvalue multisite streamflow generator. (Knapp-USGS)

Descriptors: *Tritium, *Fallout, Groundwater movement, *Karst, *Aquifers, Hydrogeology, Tracers, Tracking techniques, Sampling, Hydrologic data, Monitoring.
Identifiers: France.

Tritiated water of thermonuclear origin is a new and very interesting parameter of which the hydrogeologist is making increasing use in the study of various problems. In karsts, the water from precipitation shows an annual maximum of concentrations in June. This signal can be used to establish correlations between the losses from an aquifer and resurgence about 30 km away, by means of a series of systematic measurements of the precipitation supplying aquifers and springs. These measurements have been valuable in a trial project involving a gamma-emitting tracer. A network for the collection of atmospheric tritiated water was set up for the collection and measurement of monthly samples collected at 26 stations spread fairly evenly across France. Its purpose is twofold: Primarily to constitute a bank of samples, or sampling data, for use in any subsequent hydrological studies carried out in France; and secondly, to permit study of the spatial distribution of tritium fallout. Tritium isoconcentration curves show a sea/continent effect, whereby tritium concentraions increase inland. (Knapp-USGS)

AUTOMATION OF ATOMIC ABSORPTION ANALYSES,
Geological Survey, Denver, Colo.
M. J. Fishman, and D. E. Erdmann.
French and German abstracts. Atomic Absorption Newsletter, Vol 9, No 4, p 88-89, July-August, 1970. 2 p, 1 fig, 3 tab, 1 ref.

Descriptors: *Chemical analysis, *Spectrophotometry, *Colorimetry, *Automation, *Analytical techniques, Laboratory equipment, Water analysis, Laboratory tests, Trace elements, Water quality, Water chemistry.
Identifiers: *Atomic absorption analysis, *Direct aspiration, Data printout.

An atomic absorption spectrophotometer is automated with a sampler, proportioning pump manifold, and strip-chart recorder. Copper, lithium, manganese, potassium, sodium, iron, and zinc are determined by direct aspiration from the sampler. The proportioning pump manifold is added to the system for the determination of calcium, magnesium, and strontium. It introduces, automatically, an interference suppressant to the samples prior to aspiration. The latter system can also be used to make dilutions. (Woodard-USGS)

STREAM GAUGING TECHNIQUES FOR REMOTE AREAS USING PORTABLE EQUIPMENT,
British Columbia Univ., Vancouver. Dept. of Geography; and Research Council of Alberta, Edmonton.
Michael Church, and Rolf Kellerhals.
Canada Inland Waters Branch Technical Bulletin No 25, Department of Energy, Mines and Resources, 1970. 89 p, 24 fig, 11 tab, 109 ref.

Descriptors: *Stream gages, *Discharge measurement, *Instrumentation, Flowmeters, Current meters, Gaging stations, Stage-discharge relations, Dye releases, Tracers, Tracking techniques, Streamflow, Discharge (Water), Water measurement.
Identifiers: *Portable stream gaging equipment.

A variety of streamflow measuring techniques applicable to rivers with peak flows up to 10,000 cfs are reviewed. The methods are primarily suitable for the economical collection of short-term records at inaccessible or isolated sites. The emphasis is on field practice, with considerable detail being presented for the major techniques. The methods discussed include estimates of runoff using basin survey data, stage-discharge relations, artificial controls, current meters, dilution methods, and tracers. (Knapp-USGS)

THE APPLICATION OF RADIATION LOGS TO GROUNDWATER HYDROLOGY,
Geological Survey, Denver, Colo.
W. Scott Keys.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/33, p 477-488, 1967. 12 p, 4 fig, 6 ref.

Descriptors: *Borehole geophysics, *Radioactivity techniques, Hydrogeology, Aquifers, Radioactivity, Tracers, Logging (Recording), Subsurface investigations, Groundwater movement, Nuclear moisture meters, Boreholes.
Identifiers: Radiation well-logs, Test wells.

The only technique available at present for obtaining geological and hydrological information through the casing of pre-existing water wells and other boreholes is by radiation logging. Inexpensive portable radiation logging equipment is available or has been developed for groundwater studies in connection with a general research project on the application of borehole geophysics in groundwater hydrology. It is possible to obtain data on the following: the source, velocity, and chemical quality of groundwater; the location, extent, geometry, bulk density, porosity, permeability, and specific

yield of aquifers and associated strata; and the position of casings, casing collars, leaks, perforations, and cement. The radiation logs employed include natural gamma, gamma-gamma, neutron-gamma, neutron epithermal-neutron, and radioactive tracer. Typical radiation logs obtained by the various techniques are described and examples are given of practical application of radiation logging to groundwater investigations. The applications cited are studies of perched water in basaltic rocks and associated sedimentary strata; the porosity, moisture content, and position of zones into which water was injected in volcanic tuff; the position of the interface between brine and fresh water in fine-grained carbonate rocks and associated fine clastic rocks; the interpretation of porosity from a neutron log, and the location by means of a radioactive tracer of the more permeable fracture zones in a well penetrating crystalline rock. (Knapp-USGS)

RADIOISOTOPE TRACERS IN LARGE-SCALE RECHARGE STUDIES OF GROUNDWATER,
Water Planning for Israel Ltd., Tel Aviv (Israel); and Weizmann Inst. of Science, Rehovoth (Israel).
R. Sternau, J. Schwarz, A. Mercado, Y. Harpaz, and A. Nir.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/34, p 489-505, 1967. 17 p, 9 fig, 24 ref.

Descriptors: *Tracers, *Groundwater movement, *Radioactivity techniques, *Tagging, Cobalt, Cobalt radioisotopes, Sampling, Pumping, Boreholes, Aquifers, Recharge, Monitoring, Radioisotopes.
Identifiers: Israel.

Dynamic investigations of large-scale groundwater recharge and mixing require a reliable tracing method. In the absence of natural tracer in the recharged water, tagging with Co-60 afforded excellent tracing possibilities. The hydrological basis, isotope production, injection, pumping, sampling procedures, and evaluation of results are described. For measurements of the pumped water in the field, a special gamma-detection system was designed. Small samples from observation boreholes were taken to the laboratory for measurements in another specially-designed system. Routine large-scale hydrological engineering applications of radio tracers are beneficial and feasible. Owing to the sensitivity and stability of the monitoring system, the concentration of tracer at input was low enough to ensure public protection without any sacrifice of precision. (Knapp-USGS)
W70-10100

SINGLE-WELL PULSE TECHNIQUE,
Geological Inst., Warsaw (Poland); Federal Experimental and Research Inst., Vienna (Austria); and Institute of Nuclear Research, Krakow (Poland).
M. Borowczyk, J. Mairhofer, and A. Zuber.
Supported by International Atomic Energy Agency. In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/35, p 507-519, 1967. 13 p, 6 fig, 1 tab, 8 ref.

Descriptors: *Tracers, *Tracing techniques, *Groundwater movement, *Aquifers, Groundwater basins, Sampling, Monitoring, Tagging, Radioisotopes, Boreholes.
Identifiers: Vienna Basin (Austria).

Some theoretical and experimental problems of the single-well pulse technique proposed in Israel are discussed. The single-well technique is based on a traced injection, pause and pumping. Knowing the thickness of an aquifer as well as the pumping rate, it is possible to find a distance travelled by a tracer during the pause from the measurement of tracer concentration in pumped water. The ratio of distance and duration of the pause gives natural groundwater velocity. The problem may sometimes be solved for a two-layered aquifer. A new method for interpreting the arrival time of the tracer is proposed. It is based on the time of 50% recovery of recovered amount of an injected tracer. Many limitations of the technique and an example of complex interpretation are discussed in detail. Final results are compared with those obtained from classical and other tracer methods. A general interpretation of all the data suggests that most of the water in the investigated part of the Vienna Basin flows very quickly through highly permeable zones and that the movement of water probably takes place mainly in the upper layers of the aquifer. (Knapp-USGS)

INVESTIGATIONS INTO GROUNDWATER BALANCE BY APPLYING RADIOISOTOPE TRACERS,
Research Inst. for Water Resources Development, Budapest (Hungary).
K. Ubell.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/36, p 521-530, 1967. 10 p, 5 fig, 5 ref.

Descriptors: *Tracers, *Tracking techniques, *Groundwater movement, *Soil water movement, *Water balance, Recharge, Sampling, Radioactivity techniques, Velocity, Mixing, Dispersion, Water resources development.
Identifiers: Hungary.

The methods used and the results obtained in Hungary in connection with field tests supplying radioactive tracers for solving the problems of natural groundwater balance are discussed. Moisture movements taking place through the aeration zone, recharge due to precipitation, and evaporation loss of groundwater are determined by systematic soil-moisture measurements carried out in whole vertical profiles, from the land surface down to the water table, with the aid of neutron-diffusion, based on the application of radioactive isotopes of Pu-Be source-detector as neutron radiation emitter. The flow of groundwater and horizontal movement in the zone of aeration as well as the velocity distribution according to depth are studied by multiwell tracing and single-well techniques by using I-131 tracers. (Knapp-USGS)
W70-10102

BOREHOLE DILUTION TECHNIQUES: A CRITICAL REVIEW,
International Atomic Energy Agency, Vienna (Austria); Federal Experimental and Research Inst., Vienna (Austria); and Institute of Nuclear Research, Kracow (Poland).
E. Halevy, H. Moser, O. Zellhofer, and A. Zuber.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/37, p 531-564, 1967. 34 p, 19 fig, 1 tab, 50 ref.

Descriptors: *Tracers, *Radioactivity techniques, *Groundwater movement, *Borehole geophysics, *Reviews, Bibliographies, Sampling, Monitoring, Aquifers, Mixing, Dispersion, Nuclear meters, Hydrogeology.
Identifiers: *Dilution techniques (Tracers).

Borehole dilution techniques for the determinations of filtration velocity, vertical flows and direction of groundwater flow are reviewed. The principles underlying each measurement, instrumentation, disturbing influences, and their possible correction are discussed and recommendations are made for applications and future research. (Knapp-USGS)

RADIOMETRIC METHOD OF SEEPAGE CONTROL IN DAMS AND THEIR ENVIRONS (RUSSIAN),
Polish Academy of Science, Gdansk. Inst. of Hydraulic Research.
J. Makowski.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/40, p 601-616, 1967. 16 p, 13 fig, 1 tab, 7 ref.

Descriptors: *Radioactivity techniques, *Tracers, *Seepage, *Reservoir leakage, Infiltration, Soils, Sands, Clays, Aquifers, Instrumentation, Sampling, Radioisotopes.
Identifiers: Poland.

For tracer studies of seepage, methods of choosing the injection point, techniques for introducing the radioactive solution into the soil, and the conditions that must be considered when selecting the radioisotope are described. The methods of measurement used are discussed, and a brief description of the equipment is given. A small probe was designed to measure the volumetric weight of the soil to determine the best injection point where the soil is most permeable. The radioisotopes used in the the investigations described are Cr-51 in the form Na2Cr04, Br-82 in the forms KBr and NH Br, I-131 in the forms NaI and KI, Sb-124 in the form SbC13 and Au-198 in the form HAuC14. Their adsorption values are given for pure sand soils, sand and clay mixtures and rocky soils (granite). (Knapp-USGS)
W70-10105

LABORATORY EVALUATION OF Cr-51 EDTA AS A TRACER FOR GROUNDWATER FLOW,
Chalmers Univ. of Technology, Goteborg (Sweden); and Ingeniors Vetenskaps Akademien, Stockholm (Sweden).
G. Knutsson, and H. G. Forsberg.
In: Isotopes in Hydrology, Proceedings Symposium of International Atomic Energy Agency and International Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-83/42, p 629-652, 1967. 14 p, 10 fig, 2 tab, 15 ref.

Descriptors: *Tracers, *Groundwater movement, *Chromium, *Radioisotopes, *Chelation, Adsorption, Water chemistry, Tracking techniques, Tritium, Laboratory tests, Sampling, Monitoring, Calibrations.
Identifiers: EDTA complexes.

The Cr-51 EDTA complex can be used successfully for tracing groundwater movement. In many cases spiking of the Cr-51 tracer with tritium is advantageous, and a procedure has been worked out for their simultaneous determination by liquid-scintillation counting. This technique has proved to be particularly useful when the samples are not too dilute. The use of a flow cell for continuous recording during column tests was studied, and the possibility of applying this method to field investigations is discussed. Cr-51 EDTA, at concentrations down to 0.001 ppm, is neither adsorbed nor much retarded in minerals such as quartz, feldspars, some micas, calcite and dolomite. Some of the ferromagnesian silicates and other iron-bearing minerals have a considerable effect. Upon passage through secondary minerals, such as clay minerals, Cr-51 EDTA is retarded, and chlorite particularly causes a marked delay. Losses of the complex seem to occur in illite. Tritium is retarded more than Cr-51 EDTA in bentonite and in montmorillonite, and to some extent in the other clay minerals. Variation in pH or in flow-rate does not affect the behavior of Cr-51 EDTA. Some recent field experience of the use of Cr-51 EDTA in Sweden and elsewhere is discussed briefly. (Knapp-USGS)

n: Isotopes in Hydrology, Proceedings Symposium f International Atomic Energy Agency and Inter-ational Union Geodesy and Geophysics, Vienna, Nov 14-18, 1966: International Atomic Energy Agency STI/PUB/141, Vienna, Paper No SM-3/43, p 653-668, 1967. 16 p, 14 fig, 9 ref.

Descriptors: *Tracers, *Groundwater movement, Chromium, *Radioisotopes, *Chelation, Adsorp-on, Water chemistry, Tracking techniques, Calibrations, Activated carbon.
Identifiers: Radon.

The choice of a tracer for groundwater hydrology epends on the behavior of the tracer in relation to ne ground it passes through and on the sensitivity ith which it can be detected. Cr-51, which is ecognized as a good radioactive tracer for ground-ater is suggested, in a method in which en-chment is achieved by dripping labeled water nto activated carbon. At very low concentrations ne radioactivity of the tracer was partly masked by ne natural water radioactivity fixed in the carbon. The artificial tracer can be distinguished by dif-erential gamma spectrometry. (Knapp-USGS)

Descriptors: *Tracers, *Reservoir leakage, Tracking techniques, *Radioactivity techniques, Radioisotopes, Tagging, Seepage, Infiltration, Dams, Reservoirs.
Identifiers: Reservoir leak tracing.

Radioactive tracers were used to establish the source of losses from an earth dam. The zones of infiltration were determined by injecting radioactive tracers in the lake at points and along lines over distances of about 50 m. The radioactivity of the water was then checked at the outlet from the dam's drains, and curves were prepared showing the point at which the radioactive cloud reached the bottom of the water in the reservoir; this was done by using a nuclear probe lowered over the side of a boat whose position was plotted from the bank. The envelope of the curves obtained when activity is detected at the outlet of the drains defines the infiltration area of the lost water. A detailed explanation is given of the technique and the modifications which might be necessary to suit special situations which can arise; these consist of using tracers easily adsorbed onto the bottom of the stored water, the use of labeled sediments and the injection of tracers through pierced tubes placed at the bottom of the reservoir. INTERPRETING NEUTRON PROBE READINGS IN FROZEN SOIL.
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
Richard A. Sartz.
USDA Forest Service Res Note NC-77, 1969. 4 p.

Descriptors: *Soil water movement, *Gravitational water, *Hydrologic properties, *Infiltration, Moisture content, Percolating water, Permeability, Soil physics, Wisconsin, Nuclear meters.
Identifiers: Interflow.

Several factors associated with soil freezing complicate the inperpretation of neutron probe readings in frozen soil. Temperature is unimportant, but the effect of vertical resolution must be considered. Because of the possibility of both gains and losses of water at the same depth during a period of measurement, interpreting changes in the water content of frozen soil is a subjective process. (Sartz-Forest Service)
W70-10412

A DEVICE FOR MEASURING SOIL FROST,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
James H. Patric, and Burley D. Fridley.
USDA Forest Service Research Note NE-94, 1969. 7 p, illus.

Descriptors: *Frost, *Frozen ground, *Frozen soils, Freezing, Heat transfer, Soil temperature, West Virginia.

A water-filled plastic tube buried vertically in the soil in a copper casing permitted repeated observation of frost depth without damaging the sampling site. The device is simple and inexpensive and provides data on soil freezing at least as accurate as direct observation by digging through frozen soil. (Patric-Forest Service)

A NUMERICAL SOLUTION FOR FINITE AMPLITUDE FREE SURFACE WAVES,
Arizona Univ., Tucson.
D. D. Fangmeier.
Water Resources Research, Vol 6, No 4, p 1216-1219, August 1970. 4 p, 3 fig, 10 ref.

Descriptors: *Computer programs, *Waves (Water), *Open channel flow, Linear programming, Streamflow, Velocity, Hydraulic models, Digital computers.
Identifiers: Wave tanks.

A technique for the numerical solution of two-dimensional potential flow with a free surface and gravity is presented. Its validity is demonstrated by application to wave generation by a pressure on a segment of the free surface of a ponded fluid. Wave profiles are obtained for the leading waves of progressive approximately periodic wave formations that show the effect of retaining the nonlinear

terms in the free surface boundary conditions. The programming is relatively simple and the technique applicable to other wave forming situations. However, long computation times are required. (Knapp-USGS)

DESIGN OF BOUNDARY ARCH DAM,
Bechtel Corp, San Francisco, Calif.
Jaroslav Pospisil, and Michael D. Hayes.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No PO1, p 73-91, Jan 1970. 19 p, 12 fig, 3 tab, 5 ref, append.

Descriptors: *Arch dams, Dam construction, *Dam design, *Concrete dams, Stress analysis, *Structural analysis, Dams, Electric analogs, Grouting, Simulation analysis, Analog models, Contraction joints, Instrumentation, Spillway gates, Sluice gates, Uplift pressure, Dam foundations, Cooling, Diversion, Engineering geology, Foundation investigations, Abutments.
Identifiers: *Thin arch dams, *Double-curvature arch dams, *Boundary Dam, Wash, Overtopping.

Preliminary design of the 360-ft-high, double-curvature, thin-arch dam was based principally on the crown cantilever adjustment method. Final design was based on the electric analogy simulation method whereby instead of constructing an analogy model, equations were written to simulate the analog and solved analytically by computer. The dam is equipped with 7 large sluice gates located 200 ft below the crest, 2 spillway gates, and ice and trash skimmer gate, and a horizontally moving maintenance gate to serve all sluice openings under full reservoir head. Arrangement and grouting of contraction joints, concrete cooling, instrumentation, site investigation and geology, hydrology, and abutment stability analysis are described. The design allowed for overtopping the partially completed dam during the flood season. (USBR)

PERMAFROST PRESENTS MECHANICAL CHALLENGES,
Kroeker (J. Donald) and Associates, Portland, Oreg.
J. Donald Kroeker.
Building System Design, Vol 67, No 5, p 17-22, May 1970. 6 p, 10 fig, 4 ref.

Descriptors: *Permafrost, Freezing, Foundation investigations, *Frozen ground, Cold regions, *Foundations, Thawing, *Frozen soils, Ventilation, Cold weather construction, Frost action, Frost heaving, Structures, Pile foundations, Refrigeration, Supports, Refrigerants, Insulation, *Piping systems (Mechanical), Slabs, *Buildings.
Identifiers: Cold climates, Building design, Ice lenses, *Cooling systems.

Prevention of thawing of permafrost upon which buildings and structures for conveying piping rest is a major problem in the frozen north. Permafrost is the permanently frozen ground below the active layer of ground subject to freezing and thawing. A type of foundation that has become traditional and is still used in many buildings through 4 stories in height consists of pilings extending into stable permafrost with first floors at least 4 ft above ground to prevent thawing beyond the active layer by heat transmission from the building. This type of support requires drilling holes into the permafrost, setting piling, backfilling with slurry, then waiting for freeze-back that may take several months. Piping systems for water supply, heating, and sewage disposal are run in utilidors also above grade. In the case of slab-on-grade foundations or in extremely high load conditions, a means of freezing the active frost zone is provided. For foundations set directly on permafrost, a means is provided to maintain the permafrost in a frozen condition. Several artificial freezing systems for foundations are discussed. Typical designs from Army Technical Manual TM5-582 for protection of permafrost under structures having floor levels above and on grade are presented. (USBR)

ARCH DAM DESIGN: STATE OF THE ART,
Bureau of Reclamation, Denver, Colo.
Merlin D. Copen, and Loyd R. Scrivner.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No PO1, p 93-108, Jan 1970. 16 p, 9 fig, 1 tab, 4 ref, append.

Descriptors: *Arch dams, Concrete dams, Dams, *Dam design, Deflection, Shape, Structural analysis, Structural behavior, Design criteria, Loads (Forces), Trial-load method, Safety factors, Stress analysis, Damsites, Tensile stress, Thrust, Dam foundations, Spillways, Foundation investigations, Rock mechanics.
Identifiers: Thin arch dams, Double-curvature arch dams, *Design practices, *Design improvements, Computer-aided design.

Prominent trends in arch dams include using thinner, more complex shapes that take advantage of inherent structural qualities of arch dams and adapt to more difficult site conditions. Large- and small-scale structural qualities of arch dams and adapt to more difficult site conditions. Large- and small-scale structural models are used for arch dam analysis; development of electronic computers has made the use of several complex and comprehensive methods of analysis feasible, including the trial-load, shell-theory, finite element, and dynamic-relation methods. The methods permit rapid, reliable evaluation of many alternative solutions for each site, subjected to all anticipated loading conditions. Good comparisons between computed and measured prototype behavior have substantiated design analyses. Better understanding of foundation requirements and rock mechanics has contributed greater safety and efficiency to arch dam design. Computed safety factors of 4 to 1 are usually required for arch dams for normal loading condtions, with a reduction permitted for unusual loading. If design features permit their consideration, orifice or overflow free-fall spillways may be more economical than tunnel or side channel spillways usually designed for arch dams. (USBR)

SELECT RESERVOIR WITHDRAWAL BY MULTILEVEL INTAKES,
Army Engineer District, Savannah, Ga.
Walter B. Benton, William J. Wall, and Shelton R. McKEEVER.
Proceedings, American Society of Civil Engineers, Journal of the Power Division, Vol 96, No PO1, p 109-115, Jan 1970. 7 p, 3 fig, 1 tab.

Descriptors: *Reservoir operation, Reservoir storage, Reservoirs, *Withdrawal, *Intakes, *Outlets, Stratification, Water quality, Outlet works, Hydraulic models, Intake structures, Thermocline, Saline water, North Carolina, *Water quality control.
Identifiers: *Selective level releases, *Multilevel outlets, New Hope Reservoir, N C/ Army Engineer Waterways Expt Sta.

Hydraulic model tests verify that multilevel intakes are an effective design for selective reservoir withdrawal. New Hope Dam and Reservoir, Cape Fear River Basin, N C, uses a multilevel intake design for selective withdrawal of impounded water as an aid in water quality control. The intakes permit flexibility in selecting the stratum from which reservoir releases are made. The model test results indicated that the proposed structure will provide effective regulation for control of water quality during the summer (minimum and average flows of 300 cfs and 800 cfs). Flows of 2400 cfs can be released without withdrawing flow below the thermocline, provided both sides of the intake structure are used and the thermocline is 40 ft below the upper pool elevation. The model indicated that operational releases of 2700 cfs through only one side of the structure will withdraw quantities as great as 10% to 33% from below the thermocline located from 40 to 90 ft, respectively, below the surface of the upper pool. The lower side intakes are least effective in drawing from the upper stratum. This may be improved by locating the structure farther away from the earth dam embankment. Model studies revealed that vibration of intake tower would not be a problem. (USBR)

ECONOMIC LOCATION OF LOCKS,
Eric E. Bottoms.
Bulletin of the Permanent International Association of Navigation Congresses, Vol 3/4, No 2, p 45-55, 1968-1969. 20 fig, 19 ref.

Descriptors: *Locks, River basin development, Channel improvement, Inland waterways, Channels.
Identifiers: *Lock location, *Lock design, Mississippi River, Ohio River, Monongahela River, Tennessee River, Gallipolis Dam and Locks, Welland Canal.

The size and location of navigation locks are determined by many factors: economic, geologic, the nature of traffic, ease and safety of navigation. The latter two are often neglected in order to curtail costs, with the result sometimes being difficult and hazardous navigation, and inefficient operation

hich increases user costs. The author states that, he needs of the customer are paramount and eserve first consideration,' and therefore locks nd navigation facilities should be designed to max-nize user benefits. Trends in barge size are iscussed with respect to their effect on the effi-ency of existing waterways and locks, which is in rn related to the serviceability of the facilities to e customer. The importance of proper design of atures such as filling systems and guard walls in educing the lockage interval is elucidated. The lo-tion of locks with respect to river bends and cur-nts is discussed. Several examples of poorly cated facilities are presented and the adverse ef-ct of their location is demonstrated. The use of odel studies and consultation of the towing indus-y is advocated in determining optimum lock loca-on. (Hewett-Rutgers)

Identifiers: Quasilinearization.

This book is concerned with the analysis, formulations, and computational sophistication involved in the use of quasilinearization, a modern mathematical technique particularly suited to digital computer applications. It is a straightforward computational technique for solving systems of nonlinear differential equations, subject to two-point or multiple-point boundary conditions, in reasonable computing times. The method of quasilinearization leads to a scheme of successive approximations that converges rapidly (quadratically) and that requires moderate amounts of computation at each stage. Methods are given for solving fluid mechanics problems involving laminar boundary layers on walls bordering flowing fluids. The Falkner-Skan extension of the Blasius equation is examined because it displays, in a simple equation, the nonlinear (bilinear) behavior typical of boundary-layer problems and two point boundary conditions. A description and listing are presented for a general quasilinearization program. Most of these techniques are designed for use in solving problems in high-velocity fluid dynamics, plasma flow, and spacecraft orbital computation, but they are also useful for solving problems of laminar and turbulent pipe flow, open channel flow, and groundwater movement. Identifiers: Arkansas River, *Low-head hydro plants, Ozark Powerplant (Ark), Webbers Falls Powerplant (Okla), R S Kerr Powerplant (Okla).

Innovations in tube turbine development resulted in its use in the Ozark and Webbers Falls Powerplants on the Arkansas River, and may reopen many of the nation's low-head undeveloped hydroelectric sites. Prior to the tube turbine, the Francis, Kaplan, and fixed-blade propeller designs, all with vertical settings, have been used for low-head sites. In most cases, very low-head sites could not be justified economically with conventional units, but development of the tube turbine makes many of the uneconomical sites attractive. Installations at the Ozark and Webbers Falls plants are compared with the nearby R S Kerr plant which has a conventional Kaplan turbine in a vertical setting. (USBR)

ELECTROMAGNETIC CHARACTERISTICS OF ISOLATED BUNDLE CONDUCTORS,
Hong Kong Univ.
S. Y. King, and J. J. Raftery.
Proc Inst Elec Eng (Engl), Vol 117, No 4, p 753-760, Apr 1970. 8 p, 11 fig, 3 tab, 10 ref, append.

Descriptors: *Transmission (Electrical), *Bundled conductors, Digital computers, Transmission lines, *Electromagnetic properties, Electric currents, Alternating current, *Mathematical analysis, Resistance, Inductance, Magnetic fields, Foreign research, Errors, Conductors, Analytical techniques.
Identifiers: China, Test results, *Accuracy, *Current density, Skin effect (Electrical), Electric conductors.

With increased voltage for power transmission, bundled conductors have become more widely used. A numerical method of obtaining the electromagnetic characteristics of bundled conductors by a digital computer is given. Accuracy of the method is assessed by applying it to isolated conductors that involve analytic solutions. The method of solution uses successive approximations to the integral equations, and a highly convergent in all practical cases. Results confirming the technique are tabulated, the maximum error being 0.05%. (USBR)

GOBERNING CHARACTERISTICS FOR 820,000 HORSEPOWER UNITS FOR GRAND COULEE THIRD POWERPLANT,
Bureau of Reclamation, Denver, Colo.
F. R. Schleif, and C. G. Bates.
Translation, Paper 70 TP 527-PWR, Inst Elec Electron Eng Summer Power Meet EHV Conf, Los Angeles, Calif, July 1970. 7 p, 10 fig, 10 ref.

Descriptors: *Hydraulic turbines, *Speed regulators, Field tests, *Characteristics, Control, Mechanical properties, Performance, Thermal power, Hydroelectric power, Servomechanisms, Hydroelectric plants, Peaking capacities, Sensitivity, Stability, *Governors.
Identifiers: *Response time, Grand Coulee Powerplant, Wash, Base loads, Dashpots, Interconnected systems, *Governors (Hydraulic).

In selecting parameters for large hydropower generating units such as those selected for the Grand Coulee Third Powerplant, control characteristics to satisfy power system needs can strongly influence economics of the design. Need for abnormal mechanical inertia and expensive reduction of the penstock water starting time are mitigated by refinement of governor characteristics. Methods are described for selecting controllability to mechanical inertia and the penstock time constant to facilitate economic proportioning. The influence of a governing system and its refinement with several new features for improved performance are discussed. (USBR)

AUTOMATIC MECHANICAL IRRIGATION GATES,
Agricultural Research Service, Kimberly, Idaho. Snake River Research Center.
Allan S. Humpherys.
Seventh Congress on Irrigation Drainage, Quest 24, Rep Disc, R1-R24, Mexico City, p 24.251-24.261, 1969. 21 p, 12 fig, 1 ref.

Descriptors: *Irrigation systems, *Turnout gates, Irrigation, Gates, Automatic control, Water distribution (Applied), *Automation, *Surface irrigation, Design.
Identifiers: Labor savings, Floating weeds.

Small automatic irrigation gates for farm distribution systems are being developed to improve the efficiency of water use and to save labor. Two general classes of gates are described: (1) fully automatic gates that operate from energy of the water flowing in the ditch and require a minimum of attention from the operator; and (2) semiautomatic gates that require resetting or moving at each irrigation. Gate design and operating mechanisms for automatic and semiautomatic irrigation systems are

reviewed. An important requirement for all automatic irrigation systems is that the water and ditches be kept weed-free. Design of any automatic irrigation system should include a weed-screening device. (USBR)

AUSTRALIAN TRENDS IN TUNNEL FORMWORK,
A. N. Sharley.
Tunnels and Tunnelling, Vol 2, No 2, p 93-97, Mar-Apr 1970. 3 p, 5 fig.

Descriptors: *Tunnel construction, Tunneling, Tunnel linings, Tunnels, *Formwork (Construction), Foreign construction, Construction materials, Handling equipment, Foreign design practices, Arch.
Identifiers: Australia, Construction methods, Curbs, Tunnel supports, Construction practices.

Primary tunneling methods and design, construction, and handling of tunnel formwork in Australia are described. Most large tunnels driven in Australia have been constructed by using curb pours, followed by arch pours, and finished by invert pours. This has been a convenient method of construction, particularly for horseshoe-shaped tunnels. The method allows use of light, relatively portable forms to establish the curb to line and level and permits part of the tunnel lining to be placed, forming the basis of rapid location for heavy arch forms and invert forms or for traveling screeds for the invert. Curb forms have generally been of light construction, supported on stakes in the floor of the tunnel and spaced from the excavation at the upper edge of the forms by rock ties. Panel construction has been of suitably ribbed, light gage steel. Arch forms have been designed to be self-supporting between the curbs or the sides of the invert, with hinge locks incorporated to ensure that the form assembly acts as a 2- or 3-pin arch. Current practice in Australia is to fabricate forms so that the skin sheet and all supporting members are of integral construction. Transport of forms in tunnels is by a special-purpose, rail-mounted form-traveler or jumbo. (USBR)

Identifiers: Blanket grouting, Dam stability, Chute spillways, Outlet tunnels, Great Britain, Sprayed concrete.

Llyn Brianne Dam, now being constructed on the River Towy, consists of an earth and rockfill embankment, an open chute spillway, tunnel diversion and outlet works, and fish handling facilities. Site geology, embankment design, materials selection, instrumentation, foundation treatment, features of the appurtenant structures, and construction are discussed. The dam embankment is 300 ft high and consists of a thin earthfill core protected by filter and transition zones and outer shells of rockfill. Rockfill is compacted in 3-ft layers by 4 passes of an 8.5-ton vibrating roller. Earthfill is compacted slightly wet of optimum water content in 12-in. layers by the 8.5-ton vibrating roller or by a 50-ton rubber-tired roller. The dam foundation is indurated slaty mudstone with minor graywacke beds covered by light overburden. Other than stripping overburden, foundation treatment is confined to the core contact area and includes excavation of open-jointed rock, removal of cliffs and crags, filling of local irregularities with dental concrete, coating the area with pneumatically applied cement mortar, blanket grouting the area, with curtain grouting up to 200 ft deep for the length of the dam. (USBR)

8E. Rock Mechanics and Geology

THE INFLUENCE OF ROCK CHARACTERISTICS ON THE STABILITY OF ROCK CAVITIES,
G. Lombardi.
Tunnels and Tunnelling, Vol 2, No 1, No 2, p 19-22, 104-109, Jan-Feb, Mar-Apr, 1970. 10 p, 17 fig, 5 ref.

Descriptors: *Rock mechanics, Rock properties, *Cavities, Deformation, *Tunnels, Tunnel pressures, Tunnel design, Stress distribution, Fissures (Geology), *Stress analysis, Anisotropy, *Stability, Foreign research, Tunnel linings, Residual stress, Discontinuities, Lateral forces, Strain, Stress.
Identifiers: *Rock pressure, Stress ratio, Openings, Rock dilation, Switzerland, Underground openings.

Concepts concerning the forces about cavities in rock formations are discussed. Included are: (1) natural or preexisting state of stress in rock, (2) rock properties that determine the effects of manmade changes to the geologic structure, (3) continuous and discontinuous rock systems, and (4) mechanical reactions of rock around an excavation. Results of a few analyzed cases show the effects in a tunnel of anisotropy and variation of inside pressure, friction angle, and laterial pressure. To determine formation pressure exerted on a tunnel lining, knowledge of the following values is essential: (1) existing stress conditions in the formation before construction begins, especially the ratio of vertical to horizontal stress; (2) cohesion and friction angle along fissure systems; and (3) volume increase caused by failure in the formation. With these values and a mathematically usable formulation of the construction sequence, all practical cases of cavities in rock can be analyzed. (USBR)
W70-10128

THE STABILITY OF PARTLY IMMERGED FISSURED ROCK MASSES, AND THE VAIONT ROCK SLIDE,
C. Jaeger.
Civ Eng Public Works Rev, Vol 64, No 761, p 1204-1207, Dec 1969. 4 p, 13 fig, 1 tab, 10 ref.

Descriptors: Stability, Stability analysis, *Slope stability, Banks, Earth movements, Mass wasting, *Landslides, *Rockslides, Rock mechanics, Soil mechanics, *Reservoirs, *Bank stability, Failures, Uplift pressure, Pore pressure, Pore water pressures, Engineering geology, Theory, Creep, Brittle failures, Failure (Mechanics).
Identifiers: Rock slope stability, Failure surfaces, *Vaiont slide, Italy.

Examination of conditions at the Vaiont slide in Italy shows that the usually accepted approach to the stability of reservoir banks is inadequate for explaining rock movements preceding and on the day of the explosive slide. The usually accepted approach and some general probleming concerning rockslides are discussed. Several papers are cited concerning the Vaiont slide. The event is described as starting with a small partial slide of the continuous visco-plastic type during the first partial filling of the reservoir. Movement and stabilization of the rock masses corresponded to raising and lowering of the reservoir water level respectively until just prior to failure, when lowering of the water level did not stop movement. A hypothesis of discontinuous movement of the rock masses is the only possible assumption in this case becuase continuous creep occurring along a concave sliding surface cannot accelerate suddenly. Uplift forces caused progressive deterioration of rock strength on the lower section of the sliding surface until a fragile rupture occurred, permitting a sudden acceleration of the rock masses. (USBR)

DETERMINING IN-SITU ROCK STRENGTH,
Falconbridge Nickel Mines Ltd.
K. H. S. Deshwar.
Eng Mining J, Vol 171, No 5, p 84-85, May 1970. 2 p, 1 fig, 2 tab, 7 ref.

Descriptors: *Rock mechanics, *Rock properties, Displacements, Poisson ratio, Rocks, Strength, Elasticity modulus, Discontinuities, Compressive strength, Laboratory tests, Methodology, Mechanical properties, Tensile strength, Youngs modulus, Elastic deformation.
Identifiers: *In situ rock, Empirical equations, Comparative studies, *Empirical methods, Elastic coefficient, Underground openings.

A simple technique for determining the in situ strength and elastic constants of rock structures is presented. The method is more accurate than present laboratory tests and considerably less expensive than field tests. The method is based on an empirical relationship between massive and small-scale properties of various rocks developed by Protodyakonov after a comprehensive investigation into the effects of planes of weakness on rock masses. Using in situ rock properties determined by the method, displacements of an underground excavation were computed by the finite element method and compared to measured displacements. Results show that the method gives a good approximation of in situ rock properties. (USBR)

dentifiers: *Construction methods, Cost savings, Cutters, Rapid excavation, *River Mountains Tunel, Nev.

he 19,970-ft-long, 10-ft-dia River Mountains unnel, a key feature of the Southern Nevada Vater Project, was excavated by a mechanical borng machine through rock thought to be too hard to ole. The tunnel traverses extrusive volcanic rocks f complex and variable geology. Individual rock ypes had extreme variations in hardness and drillaility. Tunneling equipment, construction rocedures, dust control, rock support, and alineent control are described. The mole had an vailability of 80%. Most downtime was caused by ailure of the drive pinion resulting from unanicipated high torque loads in drilling soft tuffs; emaining downtime was caused by repairs to the ydraulic system. Cutter life was longer than exected, resulting in an average cutter cost of less han $15 per foot of tunnel. Production of the mole aried from 10 ft per day in moist tuffs to 23 ft per r in ideal moling rock. Careful construction lanning had allowed for most problems encounered during the excavation, and the tunnel was oled through on schedule at a cost of $90 per ft, n estimated savings of $50 per ft over usual tunnel xcavation methods. Proceedings, American Society of Civil Engineers, ournal of the Construction Division, Vol 96, No CO1, p 9-17, June 1970. 9 p, 5 fig, 1 tab, 8 ref, apend.

Descriptors: *Underwater construction, Concrete onstruction, Tremie concrete, Portland cements, Concrete structures, Performance, Piers, Durability, Corrosion, Inspection, Reinforcement, Cast-n-place structures, Underwater, Sea water.
dentifiers: *Construction methods, Undersea queduct (Collective), Corrosion environments, ulfate-resisting cements.

During the past half century, more reinforced oncrete wharves and piers of the slender-pillar ype have been constructed in Norwegian harbors han all other types of wharves put together. The nethod of pouring the slender, reinforced concrete illars underwater has made this type of wharf construction economically favorable. A comprehensive field inspection of 219 older structures of this type was made. The overall good condition observed proves that concrete can be placed successfully underwater, even for reinforced concrete members having relatively narrow cross sections. The findings emphasize that a proper casting technique is essential, and that sulfate-resisting cements are generally preferable in this type of underwater construction, even in cold climates. (USBR)

MINIMIZING ERRORS IN GAMMA-RAY SURFACE-TYPE DENSITY GAGES: EXISTING GAGES AND NEW DESIGN CONCEPTS,
North Carolina State Univ., Raleigh.
William L. Dunn, and Frank H. McDougall.
Highway Research Record, No 301, p 40-52, 1970. 13 p, 3 fig, 8 tab, 6 ref.

Descriptors: *Densimeters, *Gamma rays, Soil density, Reviews, Errors, Design, *Gages, Instrumentation, Nuclear energy, Measurement, Radiation, Radiation measurement, Calibrations, Standards, Electronic equipment, Soil mechanics.
Identifiers: *Nuclear density meters, Backscattering, Spectrometry, Accuracy, Air gaps.

Backscatter-type nuclear density gages have been in existence for many years, but have been slow in gaining widespread commercial acceptance because accuracy of the gages has not been satisfactory. Research on identifying, measuring, and minimizing gage errors is reviewed, and suggestions for improving gage accuracy on present-generation commercial gages are included. The dual-gage principle offers much promise for improving gage performance. Optimum dual-gage systems are being designed on the basis of maximizing a quality factor that is a function of all gage errors and the measurement volume. Two prototype gages were constructed to aid in the evaluation. Results from initial testing of both systems are presented, indicating that a significant improvement in accuracy is possible. Present capabilities of gamma-ray surface-type density gages are summarized, techniques that may be applied to existing gages for obtaining the best possible performance are discussed, and new design concepts for developing more accurate and efficient gages are proposed. (USBR)

ENVIRONMENTAL POLLUTION-A SELECTIVE BIBLIOGRAPHY.
Clearinghouse for Federal Scientific and Technical Information, Springfield, Va. Information Services Section.

May 1970. 32 p.

Descriptors: *Bibliographies, *Water pollution, *Air pollution, Pesticides, Population, Radioactive wastes, Waste disposal, Waste treatment, Oily water, Thermal pollution, Pollution abatement.
Identifiers: Pollution bibliography, Environment pollution.

This bibliography of approximately 300 items, lists federally sponsored research in air and water pollution by such departments and agencies as HEW, Interior, AEC, NASA, Defense, Transportation and others. These reports do not represent all that are available from the Clearinghouse, but were selected from those appearing in our announcement journals during the period 1968 through April 1970. Unless otherwise specified, reports are available from the Clearinghouse. Ordering instructions are given. Specific pollution topics listed include engine exhausts, sulfur oxides, noise, pesticides, population, radioactive contamination, wastes (general), wastes (treatment), water pollution (general), water pollution (oil), and water pollution (thermal). BRIEF HISTORY OF MINAMATA DISEASE RESEARCH AND THE PRESENT
SITUATION OF MERCURY POLLUTION IN JAPAN,
7C-10323 05C

ANE UNIV., NEW ORLEANS, LA. SCHOOL OF ENGINEERING.
VOLUTION OF TIDEWATER PORT,
7C-10088 08E

XON OIL COMPANY OF CALIFORNIA, LOS ANGELES. DEPT. OF AIR
WATER CONSERVATION.
OLLUTION CONTROL AT A MAJOR OIL SPILL,
70-10043 05G

NITED STATES CONFERENCE OF MAYORS, WASHINGTON, D.C.
E E E IN E E W SOME MANAGEMENT ISSUES,
7C-10204 06E

NIVERSITY COLL. OF RHODESIA AND NYASALAND, SALISBURY.
EPT. OF ZOOLOGY.
TUDIES ON CENTRAL AFRICAN PANS III FAUNA AND PHYSICO-
HEMICAL ENVIRONMENT OF SOME EPHEMERAL POOLS,
70-10296 02H

NIVERSITY OF THE WEST INDIES, ST. AUGUSTINE (TRINIDAD).
HE FRICTION COEFFICIENT FOR SHALLOW FLOWS OVER A SIMULATED
URF SURFACE,
7C-10001 02E

AH STATE UNIV., LOGAN.
FFECTS OF SIMULATED GRAZING ON SOIL MOISTURE CONTENT IN MID
LEVATION RESEEDED RANGELAND,
70-10291 03F

AH UNIV., SALT LAKE CITY. DEPT. OF BOTANY.
HE EFFECT OF SALT CONCENTRATION ON THE GROWTH AND
ETABOLISM OF A SUCCULENT HALOPHYTE,
7C-10307 02I

AH WATER RESEARCH LAB., LOGAN.
IRRIGATION REQUIREMENTS FROM EVAPORATION,
W7C-10141 02D

VIRGINIA POLYTECHNIC INST., BLACKSBURG. DEPT. OF BIOLOGY.
BIOLOGICAL SYSTEMS AS POLLUTION MONITORS,
W70-10273 05A

FISH BIOASSAYS - REPRODUCIBILITY AND RATING,
W70-10326 05A

VIRGINIA POLYTECHNIC INST., BLACKSBURG. DEPT. OF BOTANY.
INVASION OF THE AQUATIC HABITAT BY AMPHIBIOUS SPECIES OF
POLYGONUM,
W70-10113 02I

VIRGINIA POLYTECHNIC INST., BLACKSBURG. DEPT. OF CIVIL
ENGINEERING.
MICROBIAL RELEASE OF SOLUBLE PHOSPHATE IN AN ACTIVATED
SLUDGE ENVIRONMENT,
W70-10112 05D

VIRGINIA UNIV., CHARLOTTESVILLE.
CRITERIA OF EFFICIENCY IN GOVERNMENT EXPENDITURES,
W70-10200 06B

VIRGINIA UNIV., CHARLOTTESVILLE. SCHOOL OF ENGINEERING AND
APPLIED SCIENCE.
INFLUENCE OF SOLAR RADIATION REFLECTANCE ON WATER
EVAPORATION,
W70-10271 02D

WARREN SPRING LAB., STEVENAGE (ENGLAND).
UNITED KINGDOM MINISTRY OF TECHNOLOGY WORK ON OIL POLLUTION,
W70-10037 05G

WASHINGTON STATE UNIV., PULLMAN. COLL. OF ENGINEERING
RESEARCH DIV.
RUNOFF GENERATION IN WESTERN WASHINGTON AS A FUNCTION OF
PRECIPITATION AND WATERSHED CHARACTERISTICS,
W70-10122 02A

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF CIVIL
ENGINEERING.
THE STORAGE COEFFICIENT AS A FUNCTION OF WATER TABLE
CELERITY,
W70-10119 02F

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF WILDLIFE BIOLOGY.
EFFECTS OF WATER IMPOUNDMENTS ON REPRODUCTION AND POPULATION
NUMBER OF WATERFOWL ON THE SNAKE RIVER, WASHINGTON,
W70-10117 06G

WASHINGTON STATE UNIV., SEATTLE. CHARLES W. HARRIS
HYDRAULICS LAB.
FLOW SERIAL CORRELATION AND RELATED STREAMFLOW GENERATION
MODELS,
W70-10120 02E

WASHINGTON UNIV., SEATTLE. CHARLES W. HARRIS HYDRAULICS
LAB.
INTERNAL CURRENTS RESULTING FROM INTERMEDIATE DENSITY
INFLOWS INTO STRATIFIED RESERVOIRS,
W70-10121 02E

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.
NITRATE REMOVAL FROM ACTIVATED SLUDGE SYSTEMS,
W70-10116 05D

BOUNDARY SHEAR STRESS IN RIVERS AND ESTUARIES,
W70-10257 02E

WASHINGTON UNIV., SEATTLE. INST. OF FOREST PRODUCTS.
ENHANCEMENT OF WATER QUALITY USING FOREST-DERIVED
COAGULATING SYSTEMS. PART I. THE COAGULANT AND DISPERSANT
CHARACTERISTICS OF LIGNOSULPHONATES,
W70-10115 05D

WATER PLANNING FOR ISRAEL LTD., TEL AVIV (ISRAEL) AND
WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL).
RADIOISOTOPE TRACERS IN LARGE-SCALE RECHARGE STUDIES OF
GROUNDWATER,
W70-10100 07B

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
NITRIFICATION IN TREATMENT PLANTS AND NAUTRAL WATERS SOME
IMPLICATIONS OF THE THEORETICAL MODELS,
W70-10388 05D

WATER RESOURCES COUNCILS, WASHINGTON, D.C.
SECTION III BENEFIT EVALUATION CONCEPTS.
W70-10366 06B

WATER RESOURCES COUNCIL, WASHINGTON, D.C.
ANNOTATED BIBLIOGRAPHY ON HYDROLOGY AND SEDIMENTATION 1966-
1968, UNITED STATES AND CANADA.
W70-10318 02E

PROCEDURES FOR EVALUATION OF WATER AND RELATED LAND RESOURCE
PROJECTS, REPORT TO THE WATER RESOURCES COUNCIL BY THE
SPECIAL TASK FORCE.
W70-10363 06B

SECTION I INTRODUCTION.
W70-10364 06B

SECTION II NATIONAL OBJECTIVES.
W70-10365 06B

SECTION IV NATIONAL OBJECTIVE ACCOUNTS.
W70-10367 06B

SECTION V PLAN FORMULATION.
W70-10368 06B

SECTION VI EVALUATION PRACTICES AND MEASUREMENT TECHNIQUES.
W70-10369 06E

WATERLOO UNIV. (ONTARIO).
DISPERSAL OF EFFLUENTS IN THE GREAT LAKES,
W70-10051 05B

THE RELATIONSHIP BETWEEN DISSOLVED NUTRIENT SALTS AND PROTEIN PRODUCTION IN SUBMERGED AUTUMNAL LEAVES,
W70-10163 02K

WATERLOOPKUNDIG LABORATORIUM, DELFT (NETHERLANDS).
THE FLOW OF ROUND BUOYANT JETS ISSUING VERTICALLY INTO AMBIENT FLUID FLOWING IN A HORIZONTAL DIRECTION,
W70-10209 05G

WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL).
USE OF ISOTOPIC DECAY RATES IN TURBULENT DISPERSION STUDIES,
W70-10268 05B

WISCONSIN UNIV., MADISON, WATER CHEMISTRY LAB.
A REVIEW OF CHLORINATED BIPHENYL CONTAMINATION IN NATURAL WATERS,
W70-10277 05B

WISCONSIN UNIV., MADISON.
POST-IRRIGATION MOVEMENT OF SOIL WATER 2. SIMULTANEOUS REDISTRIBUTION AND EVAPORATION,
W70-10247 02G

WISCONSIN UNIV., MILWAUKEE. CENTER FOR GREAT LAKES STUDIES.
GREAT LAKES PORTS FACE FORMIDABLE CHALLENGES,
W70-10176 06E

YALE UNIV., NEW HAVEN, CONN.
DATA, RESEARCH, AND GOVERNMENT,
W70-10202 06B

ZIMPRO, INC., ROTHSCHILD, WIS.
BIOLOGICAL TREATMENT OF THERMALLY CONDITIONED SLUDGE LIQUORS,
W70-10336 05D
